## THE WEEK.

THE attempt to discover the Ark of the Covenant within the Hill of Tara, which has caused some amazement during the past week, is not novel. Excavations have been commenced on former occasions, but as they were never allowed to be completed the explorers remained unsatisfied. So much has been said and written for many centuries by imaginative people concerning Tara, we need not wonder if religious enthusiasts, who are always on the look-out for material confirmation of biblical truths, should have concluded that the hill was made the depository of a sacred treasure. When we find Mr. WYNDHAM, the Irish Secretary, allowing the Irish strain in his blood to get the better of him, and to say that the present features of the ground precisely conform to ancient accounts of the regal buildings that once stood on the Hill of Tara, it was pardonable in TOM MOORE to chant about Tara's halls and the chiefs and ladies bright who dwelt in them; but a Secretary of State should be more circumspect. Mr. WYNDHAM could easily have ascertained that the only regal buildings at Tara were no more than mud banks. Tara is but one of the countless primitive earthworks which are scattered over Ireland. The mounds are scheduled under the Ancient Monuments Act, but that enactment is one of those through which, as Irish lawyers say, a coach and six can be easily driven. The owner and lessee have been persuaded to put an end to the excavations for the present, or at least to wait until the Royal Society of Antiquaries of Ireland have made experiments in digging. It may be safely concluded that no ancient ark will ever be unearthed. The Coronation-stone which was believed to have been used at Tara was for a long time accepted as having served for a pillow for the Patriarch JACOB, but geology has demonstrated that the stone does not belong to any strata found in Palestine, and the worthlessness of tradition in one case should be enough to induce pious folks to be incredulous about similar myths.

AMONG German buildings there is not one which appeals more strongly to people in all parts of the Empire than the castle of Heidelberg. This is proved by the number of verses which have been composed in praise of the ruins. At the present time the castle gains a new interest, for it is a memorial of what Frenchmen can do as invaders in making war against buildings as well as against men. It forms, too, an element in one of the most beautiful of landscapes, for the red sandstone walls when viewed from the opposite bank of the Neckar make an impression which can never be forgotten by the stranger. The problem of restoration is exceptionally difficult in Heidelberg. Some enthusiasts would not allow the slightest alteration to be effected, but a part of the buildings is unroofed, and from the exposed condition the sandstone suffers from wind and rain. On the other hand, more practical admirers admit the necessity of repairs, but when scaffolding is erected for the purpose they look on the building as outraged. The Grand Duke of BADEN has been lately besought to take measures to prevent further decay, but it has been announced officially that everything has been done, or is in contemplation, which prudence

dictates. The first question really is to roof or not to roof? And there are numerous opponents of either course. The great interest in the building is realised by the Government, and we think they are right in proceeding slowly with restoration. The castle is one of those buildings which should be surrounded with a colossal glass case, but would the pilgrims for whom an almost perpendicular railway has had to be constructed tolerate that kind of protection?

MONDAY last was the day fixed for the reception of designs for the proposed Liverpool Cathedral. As it was believed that some designs which were on their way were not delivered, the building committee extended the time until Wednesday. Owing to the magnitude of the work it was thought by many experts that only a limited number of architects would undertake the risk of preparing designs. But a great many cases have been received not only from various parts of Great Britain but from the colonies also. The Americans likewise, it is said, have contributed designs, and some have arrived from continental cities. On Monday next the committee will consult with their advisers about the examination of the designs, a process which it is anticipated will not be finished for several months. The cathedral committee have purchased the reversion of the leasehold house properties on the Mount for 1,300*l.*, and the remainder of the land, comprising St. James's Mount Gardens, for 10,000*l.*, subject to a proviso that so much of the land as may not be required for the site of the cathedral shall be retained as "public walks," and that so much of it as may not be required for building operations shall be left to the use of the public whilst the cathedral is building.

SEVERAL English explorers have before now taken an interest in ancient Ephesus. POCOCKE prepared a plan of the city which proved that the walls were about four miles in circuit. They were roughly built, but cased with cut stone and defended by towers. The Dilettanti Society's work, "The Antiquities of Iona," contains views and plans of many of the buildings, including the gymnasium, the circus, temples, &c. It will be remembered that the city possessed the great temple which HEROSTRATUS set in flames in order to secure a record of his name with remote posterity. The Archæological Institute of Vienna have of late years made Ephesus the scene of operations. Their representative, Professor BENNDORFF, has purchased a large tract of ground near the harbour for the purpose of excavations. By means of the last season's excavations the remains of the theatre are now open to view. The unearthing of some streets which belonged to Roman Ephesus has also been accomplished, and evidence is forthcoming that in the fourth century of our era there was a systematic lighting of the thoroughfares of that part of the city. Numerous new inscriptions in Greek have been obtained. In the excavations which are about to be resumed it is anticipated that ruins of private houses will become visible. It is considered that the results justify the outlay, and Vienna will be enriched by some remarkable works, which will be more impressive than any of the examples of sculpture which have been hitherto derived from Ephesus.

PAINTER'S ARCHITECTURE: PALMA VECCHIO.

## HEREFORD CATHEDRAL.\*

STONES have been described as "crying out" and "rising in mutiny." Expressions are allowable which impart life to materials that are so closely associated with men. Why should not a building be accepted as "a thing of life" as well as a ship? If stones were endowed with voices, complaints from many old English churches would be heard throughout the land. Hardly one of them has escaped suffering. At one time it would be no exaggeration to compare them to organic beings; but the character which gave them the unity and subordination of parts to a definite purpose which mark all living things has been mutilated or changed according to the whims of the moment. No ecclesiastical building in England would possess more right to have its outcries listened to than the cathedral of Hereford.

Prior to the middle of the seventeenth century, when the city was besieged by the Parliamentary army, the building seems to have been respected. Sir WILLIAM WALLER, who commanded the attacking forces, gave a guarantee that the cathedral would not suffer. But with zealots who were inspired by hatred of everything artistic which was employed as an auxiliary in Church services, it was inevitable that in the "purification" of the cathedral much vandalism would be perpetrated. After the restoration of CHARLES II., efforts were made to retrieve some of the mischief caused by the Puritans, but any work which was done under the circumstances was hardly likely to be conducted with discretion. At the beginning of the eighteenth century PHILIP BISSE was appointed bishop; he was liberal in expending money on restoration. He issued orders that the choir was to be "beautified throughout, and a most magnificent altarpiece to be erected, one of the stateliest and loftiest in England." HENRY EGERTON, who became bishop in 1724, was, like BISSE, disposed to transform the cathedral into something that would gratify the taste of the century. In 1737 it was related that "they are pulling down the venerable Gothic chapel belonging to the bishop's palace, in order to erect a more polite and neat pile in the present taste." The words indicate the spirit in which restoration was entered upon, and the mongrel forms which were to appear.

BISSE's decorations recalled what was then to be seen on the stage, and the mass of sham drapery with the big sham tassels might have been prepared by a scene-painter. It was thought, however, to increase the interest of a representation of the Last Supper. But it was not merely embellishment of the kind which deserved condemnation. The masons who were employed apparently lost their good sense along with the Bishop and the dignitaries. There is little doubt that the collapse of the west front and part of the nave of Hereford Cathedral in 1786 was caused by the mass of stone which was provided for safety. It was an excessive weight in the wrong place. This conclusion is justified by the remarks of JOHN CARTER, the architect, which were as follows:—

I now recall to memory some circumstances which preceded the destruction of the west end of the cathedral in the city. On viewing the west end I noticed that the north-west angle

of it appeared in a dangerous state, as several large fractures were apparent in many places. On expressing my apprehensions for the safety of the building, I was shown what had lately been done for preserving it from any danger that might happen from such appearances. I was shown a prodigious pile of masonry which had been raised against the inside walls of the above-mentioned angle. This business, I plainly observed, looked to me a palpable design to throw down the fabric, not to protect it. And my prediction was but too soon verified.

Another architect of the time foretold that other cathedrals were also likely to give way from the indifference of the authorities. "It is," he said, "partly through the neglect of the chapters and partly by the ill-management of the architects they employ, that they (the cathedrals) are falling about our ears." Happily this fear was groundless. It is not easy to determine the character of the vanished west front. BROWNE WILLIS gave a sketch of it, but the details are, we suppose, as incorrect as in the majority of his views. One writer says:—

The nave and aisles were flanked with square turrets, enriched, as the walls themselves were also, with several rows of intersecting semicircular arches resting on slender and short columns. The turrets were all surmounted with plain spires. The great west door was semicircular, deeply recessed and richly adorned. Over this door was a large painted window of Perpendicular character, which could form no part of the original design, but its insertion must have greatly weakened the wall above it, and contributed mainly to the downfall of the tower. The original windows were probably three in number, side by side, the centre one higher than the others and all of them round-headed and of one light each. The gable point of the nave was afterwards taken down, and the tower carried up instead of it to the height of 130 feet, and in its form and details bore a strong resemblance to the great central tower, which still exists. The original west front was the work of Bishop Lozing, the tower of Bishop Braoes, the former in the reign of William the Conqueror, the latter in that of King John. The great window must have been inserted about the beginning of the reign of Henry VI.

JAMES WYATT had taken up Gothic architecture only a couple of years before the fall of Hereford. Previously he was known mainly as a practitioner in the Italian style, but on the death of JAMES ESSEX in 1784, there seemed to be an opening for an architect who professed to understand the mysteries of Gothic. WYATT had not given much, if any, attention to the subject, and there were no books or engravings to enlighten him. But he was a daring man, with that conviction of his own infallibility which ignorance confers, and he undertook the restoration of Hereford Cathedral with a light heart, as if he were commissioned to add a retiring-room to his Pantheon. He was ten years engaged in his operations, and at the end of that time the cathedral must have been hardly recognisable by those who were acquainted with it in its former state.

It would occupy a large amount of space to enumerate the various items which make up the havoc which WYATT caused in order to demonstrate his superiority to the Mediæval architects. In 1827 the compiler of a guide-book, who was not unfriendly to him, gives the following summary of the new works and alterations:—"The total rebuilding of the west front without a tower, the foundations of which were removed 15 feet inward, and the nave

\* See Illustration.

consequently was as much shortened; the arcades and clerestory windows in the upper part of the nave altered from the circular to the pointed form; the vaulting of the nave renewed; the roofs of the nave, choir and transepts flattened; the spire taken down from the central tower, the battlements raised somewhat higher, and pinnacles with crockets placed at the angles." The Rev. THOMAS GARBETT, in his book on the cathedral, which also appeared in 1827, says:—"The foundation (the church) itself has been so much abridged, that of the four arches which perished with the tower two only have been rebuilt, and those without the least decorative feature. A change also took place in the interior, for which no reason has been assigned, and which merits unqualified condemnation, viz. raising the pavement so as to conceal the square basement of the pillars, and consequently to diminish the height both of the nave and side aisles. The choir was originally approached by a flight of steps; but these are now done away." After all these changes and omissions it is allowable to imagine that the old stones which were fortunate in surviving unharmed would mutiny at the loss of their companions and the introduction of new ones which bore no relationship to them.

WYATT'S alterations served for several years. In 1841 it became necessary to face another restoration. The work was placed in the hands of Mr. L. N. COTTINGHAM, who had already undertaken similar efforts at Rochester Castle, the chapel of Magdalen College, Oxford; St. Albans Abbey; Armagh Cathedral; St. Saviour's, Southwark; the Temple Church, &c. Hereford was destined to be his last work. The piers which supported the central tower had been constructed to support a shorter, lighter and earlier structure. The great Decorated lantern in course of time was from its weight crushing the piers. The interior walls, up to the bases of the fifty-two pillars surrounding the bell-ringers' chamber, were found to be in a ruinous state, for there were holes or cavities in them large enough for a man to enter, and many of the stones had succumbed to the pressure. COTTINGHAM said in one of his reports:—"I never witnessed a more awful monument of the fallibility of human skill than this tower at the present moment presents." According to his pupil, Mr. F. R. WILSON, he rebuilt each pier in turn on fresh foundations and with solid stones. He employed a forest of log scaffolding for the purpose, and displayed a profound knowledge of carpentry and the strength of timber in the execution of the work. By that exhibition of practical knowledge and power, and by the endurance for a long period of very anxious days and nights on the part of COTTINGHAM, we have handed down to us since and for all time the beautiful lantern of Hereford Cathedral, unrebuilt, unrestored and more durable than ever.

In his conclusions he was supported by Professor WILLIS. Another remarkable work was the restoration of the lady chapel, but the completion of this part was undertaken by Sir GILBERT SCOTT after the death of COTTINGHAM. The chapel was afterwards appropriated to the use of the parish of St. John the Baptist, Hereford, which, although sometimes referred to in the records, does not appear to have possessed a church of its own.

The cathedral, which during the last two centuries has been subjected to so many modifications, was probably less generally known than other buildings of its class in this country. One of the reasons was its remote position. It was an outpost between England and Wales. It was likewise assumed to possess some Welsh characteristics, and the names of many of its early bishops sounded foreign, if not fabulous, to the English ear. The site, as elsewhere, was from a remote age occupied by a church. Archbishop USHER, the Irish chronologist, says there was a See at Hereford in 544, and a Bishop of Hereford is believed to have attended a synod at Canterbury in 607. The building is under the patronage of St. ETHELBERT. At the end of the eighth century he ruled over the East Angles, and visited the Mercian court to claim the hand of OFFA'S daughter. The object of the journey was misunderstood, and was thought to be an attempt to obtain OFFA'S throne. ETHELBERT was murdered, and the body was carried for interment to Hereford. An "admirable stone church" was afterwards dedicated to the royal victim, and at his tomb many

miracles were said to be accomplished. Bishop ATHELSTAN, it is recorded, restored or rebuilt the cathedral, which was liable to attacks from the Welsh. In 1055 the Saxon Chronicle relates one of those raids and the plundering and burning of ATHELSTAN'S church. In the same year the Bishop died, and was buried in the church which he had built from the foundations.

At the time of the Conquest a foreigner, WALTER OF LORRAINE, presided over the diocese. He was succeeded by a fellow-countryman, known as ROBERT DE LOZINGA, who appears to have been one of those versatile ecclesiastics that arose occasionally in Mediæval days. According to WILLIAM OF MALMESBURY, he began to rebuild the cathedral, adopting as a model CHARLEMAGNE'S church in Aix-la-Chapelle. Many of his successors are recorded to have undertaken works in the cathedral; but it would be impossible to point out with any definiteness their respective contributions to the early work. REYNELM, DE VERE and others have parts attributed to them. EGIDIUS or GILES DE BRUSE or BRAOES, a son of Lord BRECKNOCK, is credited with the great central tower. In 1275 we read of the appointment of THOMAS DE CANTILUP; he was a type of the thirteenth-century scholar. He studied in Oxford, Paris and Rome, was Lord Chancellor, viceregal representative of HENRY III., and held various other exalted appointments; he died during a voyage to Rome, and his bones were transported to Hereford, where his beautiful tomb still exists. He was canonised, and his arms, three leopards' heads jessant, continue to serve for the See. The miracles reported as taking place at his tomb imparted a new interest to the cathedral. He may have had the chapter-house erected and a part of the cloister. THOMAS SPOFFORD, who occupied the episcopal throne for twenty-five years from 1421, is said to have expended on the buildings 2,800 marks. Bishop STANBERRY constructed a chantry chapel on the north side of the cathedral, where his remains were interred. EDMUND AUDLEY also added a beautiful chapel, which still bears his name. CHARLES BOOTH, who died in 1535, built the porch on the north side of the building.

After the Reformation building bishops are rarely heard of in Hereford. JOHN SCORY pulled down houses, sold lead, and by other means amassed great wealth, which was squandered by his son. FRANCIS GODWIN, who was an able scholar, and was promoted from Llandaff to Hereford in 1617, was, according to BROWNE WILLIS, a Simonist, and disposed of all the property he could seize for the benefit of one of his sons or daughters. MATTHEW WREN, the stout old cavalier who, after twenty years' imprisonment in the Tower, declined the liberation which his nephew, CHRISTOPHER WREN, obtained for him from CROMWELL, was Bishop of Hereford for a year. As a rule, however, divines who had gained a reputation as preachers or writers avoided Hereford. Its remoteness from the Metropolis, and from Oxford and Cambridge, was not inviting, and it holds in consequence no important place in modern ecclesiastical history. The records of an earlier time were carried off by one SILAS TAYLOR, a Parliamentary officer, who is described as having "more than an ordinary fancy and respect for books and learning;" when he died all his documents fell into the hands of his creditors.

We must take Hereford Cathedral as it exists, with all the imperfections which have followed from attempts at restoration. It represents the English varieties of Gothic. It might have been more interesting. WALLER'S soldiers are said to have removed 170 brasses, and in 1786 two tons of those memorials were sold to a brazier. In truth, little more than the bare walls have survived, and they in many parts have been tampered with. That so much impressiveness remains is a wonder.

**Coronation Honours** have been bestowed on a few artists. Sir E. J. Poynter, P.R.A., will become a baronet, Mr. William Emerson will be knighted; the same honour will be conferred on Mr. Ernest Waterlow, A.R.A., president of the Royal Society of Painters in Water Colours. Lord Kelvin has been made a Privy Councillor, as well as a member of the new Order of Merit, to which latter Mr. G. F. Watts, R.A., has also been appointed. Taw Sein Ko, M.R.A.S., F.A.I., F.S.A., Government Archaeologist, Burma, is to be granted a gold medal for public services in India. Mr. William Mather, M.P., has been made a knight.

## HISTORY IN DECORATION.\*

IT is generally accepted that a painting should represent only one subject, although subsidiary incidents may be introduced. It would be clearer to say that in the art, as in photography, a single moment is permissible, but whatever is taking place at that time can be depicted. If we consider MACLISE'S *Meeting of Wellington and Blucher* and *The Death of Nelson* as examples of the latest form of historical painting, we shall find that many varieties of action appear before our eyes, and that the attention of all the figures is not concentrated on the shaking of hands of the English and Prussian commanders, or on the expiring hero in the cockpit. Although extraordinary industry has been expended by the painter in giving completeness to the two historic scenes in order to suggest the magnitude of war, it is still felt by the spectator that much more is required. By nature we are impelled to look before and after, and MACLISE'S two pictures cannot be understood unless we are able to recall the circumstances which followed as well as those which preceded the death of NELSON and the meeting of WELLINGTON and BLUCHER.

Every educated man is enabled from his books and from traditions which are familiar as household words to comprehend the significance of the subjects which are illustrated by the two wall-paintings. But in more primitive days when books were few and costly the painters endeavoured to compensate for the deficiencies of their art by introducing a succession of incidents in the same picture. They sought control over more than one moment and made time subservient to their needs. It was objected, for instance, to the works of POLYGNOTUS, in Athens and Delphi, that he did not restrict himself to simultaneous action, but showed in the same work events which were separated by intervals of time. It has been urged by some of his defenders that the series relating to the war with Troy or the battles of the Amazons consisted of a number of independent paintings, and might be comparable to some of HOGARTH'S tragic comic series which resemble the chapters of a realistic novel. We should perhaps be nearer the truth if we believed that the Greek painter's work was executed on a like principle with GOZZOLI'S *Noah and his Family*, or his *History of Joseph*, which are known to all students of art from the engravings. In the latter, not only several periods of time are united and JOSEPH appears in three places, but, as LESLIE remarks, GOZZOLI has also adopted three different points of sight in the perspective. In spite of the violation of law the result is harmonious.

The arrangement which combines past and future with the present, although contrary to theory, has a peculiar advantage whenever painting is employed for educational purposes. An event ceases to be a single detached incident, and becomes more impressive when it can be perceived as if it were a link in a chain forged by destiny. Everybody wishes to see many things by a glance without the trouble of following them one by one and observing each separately. It may be wiser to pursue the latter course and to be analytical, but greater pleasure is given when we have a synthetical demonstration which becomes more pregnant of meaning than the historian's narrative.

There is one illustrious precedent for the treatment in the Shield of ACHILLES. On it were to be found side by side transactions which bore little or no relation except as parts of human life. The marriage festivities comprised various scenes from the leading of the brides out of their chambers unto the sumptuous banquets. There were besides dances of striplings, the proceedings when a mulct for a blood-feud was to be assessed, the appealing to the judges, the clamouring of partisans, and the elders giving judgment. There was also shown the investment of a town and a dispute among the besiegers as to whether it should be destroyed or its inhabitants and their property divided as spoil, an ambush from the town, the carrying-off of cattle, the fight to recover them, agricultural scenes with men ploughing, reaping and binding, a vintage scene, oxen attacked by lions, a labyrinth with a dance, and a performance by acrobats. Modern designers who have attempted the reproduction of HOMER'S description have sometimes divided the incidents by means of ornament in order to emphasise the absence of connection, but it is likely that in

any work which the poet had viewed and which suggested his verses the different occurrences blended like the waters of several streams. The Greeks must have known how easily joy and sorrow are commingled in this world, and one changed to the other with the suddenness which was witnessed last week in London. Old CAPULET expressed one of the peculiarities of life when he said:—

All things that we ordained festival,  
Turn from their office to black funeral;  
Our instruments to melancholy bells,  
Our wedding cheer to a sad burial feast,  
Our solemn hymns to sullen dirges change,  
Our bridal flowers serve for a buried corse,  
And all things change them to the contrary.

When it was decided in the time of the third NAPOLEON to remodel the Salle du Trône, in the Luxembourg, by turning three large chambers into one, the walls were to become representative of the history of France, the climax being reached by an apotheosis of NAPOLEON I. There was a hemicycle at each end of the Salle about 40 feet in length, and M. LEHMANN obtained the commission to fill them with subjects, one suggesting the Merovingians and the Carolingians, and the other the Capets, Valois and Bourbons. We now reproduce the second work. At first sight it would appear to be impossible to depict with any completeness the history of six centuries in a space so restricted. It would, of course, be easy to cover the wall with a series of independent illustrations like those which in our time have been employed in the Panthéon. M. LEHMANN was, however, ambitious to combine unity with variety, and to make his picture recall not only what occurred, but to reveal in it an acceptance of the most rigorous laws of composition; hence the care which is taken in the balancing of the groups.

Accordingly he has made the figure of JOAN OF ARC the centre of his composition, and by introducing a pedestal for her to stand on she becomes more exalted than any of the kings. At her feet are some of the English warriors she conquered; two of them would serve for Lord TALBOT and his son JOHN, as described in the trilogy:—

Soldiers, adieu! I have what I would have  
Now my old arms are young John Talbot's grave.

The peasant girl may be accepted as the embodiment of enthusiasm and courage, and those qualities, it will be found, are exemplified in all the types of Frenchmen which were introduced.

Take the earliest scene. PETER THE HERMIT was a Frenchman, and lived in Amiens before he visited the Holy Land. It was at the Council of Clermont, in France, the resolution was adopted to advocate a crusade for the recovery of the Holy Sepulchre, and it was presided over by a French Pope, URBAN II. Another French Pope, SILVESTER II., had earlier made an appeal by letters to the Christian princes, but URBAN II. and PETER exercised their eloquence directly on the people. Upwards of a million of men of all ranks, it is said, resolved to abandon their country and their homes to participate in the struggle. The numbers were much reduced by the time the Holy Land was reached, but in the course of three years Jerusalem was captured, and a French kingdom founded in Palestine.

The primary aim of the Crusades was to establish the Christian power as supreme in the Holy Land. But it had other ends besides. What is now known as France did not exist at the close of the eleventh century. There were a great number of duchies, principalities and lordships, and they were continually at war. The Crusades allowed Normans, Bretons, Burgundians, Gascons and other people to have one object in common. Civil war was therefore suspended for a time to the general advantage. By their contact with Easterns the ideas of Frenchmen expanded, and as a consequence a new impulse was imparted to the arts. The effect is observable during the reign of LOUIS VI. He was constantly at war with the barons, whose strongholds surrounded Paris, and who for a time were able to keep the king a prisoner, but in spite of all obstacles he instituted communes, and a new force appeared in the School of Paris, of which ABELARD and WILLIAM of Champeaux were members. The School and the Church were identified, and when LOUIS VII. attempted to control the combination he was excommunicated.

\* See Illustration.

PHILIPPE AUGUSTE, the hero of the next group, ascended the throne in 1180, and during forty-three years he was engaged in one continuous combat. There is a prejudice against him in England, for he was the rival of CŒUR-DE-LION in the third Crusade; he fought against RICHARD in Normandy and seized a great part of that country. He was no less successful in his war with the other princes. It was not only as a warrior that he gained fame. He enclosed Paris with a wall which was defended by 500 towers, he introduced order in the city and it may be said he was the creator of the University of Paris, or as it was then called: L'Etude de Paris. The students were not in favour with the citizens; town and gown rows were common occurrences. The students, it must be said, were disposed to take airs on themselves, and they contrived to live expensively regardless of the inconvenience to others. Claims for the payment of debts must have originated many of the contests. But the king made a law by which all the inhabitants of Paris were obliged to take an oath that they would denounce anyone who maltreated a student. In all such cases the trials were to take place before ecclesiastical tribunals, and as the students were to some extent recognised as clerics, it is easy to understand that justice was occasionally one sided and was rarely tempered by mercy.

LOUIS IX. is too generally thought to be only a tool of the monks, and the conventional representation of him in ecclesiastical decorations with a monk's robe beneath the royal cope has helped to support the idea. There was no doubt he was opposed to the luxury and vices which were then common in courts. But there never was a king on the French throne more anxious to secure justice for all classes, and he was more resolute than our English HENRY II. in insisting on a reform of ecclesiastical tribunals. On many occasions he proved his bravery. Above all, he was eager to have his laws observed. He acted as a judge himself, and was not less severe and impartial because his tribunal was sometimes under a tree in the forest of Vincennes. The great vassals and officers who by tradition and usage should unite with him in trying cases abandoned judicial offices, and it was necessary to have recourse to professional lawyers. In that way the French courts commenced which, amidst many difficulties, have continued to be a credit to France. No rank was sufficient to screen a criminal from the punishment which was meted out to him by LOUIS. It is no wonder, then, that the reputation of the king for equity was so universal that even the English barons of the time begged him to become arbitrator in their differences with the crown.

If King LOUIS can be regarded as the representative of the Mediævalism of the thirteenth century, FRANCIS I. stands in a similar position with the Renaissance. He was far from being a perfect monarch. It seems incredible that a king who is still accepted as the type of intellectualism should have passed an ordinance by which printing was prohibited under pain of death. "Woman often varies" was a favourite expression of his, and no better words could be employed to describe himself. A month afterwards he issued a second ordinance which allowed the printing of books under certain conditions. Free thought, however, continued to be hazardous, for ETIENNE DOLET perished at the stake. RABELAIS contrived to escape, although there can be no question that his Gargentua was FRANCIS I., and in M. LEHMANN'S group he appears laughing as if his enjoyment of life was not affected by the king's presence. It is quite characteristic of the monarch's peculiarities to see him discussing the *Thesus* with BENVENUTO CELLINI, while his arm is around his dwarf TRIBOULET. In the background the new spirit is seen withdrawing the winding sheet from the statue of ATHENÉ, which serves to suggest the revival of classicism.

HENRI QUATRE was less courtly than FRANCIS I., but he was more magnanimous. The sovereign of Navarre was always in war, and war of the worst kind, for it was inspired by differences about religion. Although many of the chiefs who surrounded HENRY IV. were as morose as the English Puritans of a later time, he was always disposed to be clement. He long fought against Paris, but when at last the gates were opened he entered as a friend rather than as a conqueror, and M. LEHMANN shows him sheathing his sword. One of his first acts was to destroy the records of

the Seize, the governing power of the city, in order that there might not be evidence available against his enemies. He had many great works executed in Paris, not merely for show, but for utility, such as the Samaritaine, by which water was distributed throughout the city. No matter what services he rendered the fanatics could not be subdued, and no less than sixteen attempts on his life were made in Paris. Finally the wretched RAVAILLAC succeeded.

The contrast between the group of Crusaders at one end and LOUIS XIV. with his ministers and courtiers at the other extremity of the hemicycle could not be easily surpassed. Selfishness takes the place of faith. The figure of the king recalls THACKERAY'S sketch, in which LOUIS appears as a very ordinary mortal and "Rex" is constituted by the State garments, the perruque and the sceptre. The Roi Soleil is represented as taller than any of the grandees about him, but that is hardly a painter's license, for, such is human infatuation, the subjects of his time imagined the king to be of unusual height. With LOUIS XIV., however, the monarchy became absolute, for he looked on himself as not only the ruler of men, but as the proprietor of all the property possessed by his people, whether clergy or laymen. Arts and manufactures were not neglected during his reign, and efforts were made to attract able foreign workmen to France. By the revocation of the Edict of Nantes more than an equivalent to the newcomers were banished from France. As Madame DE SÉVIGNÉ said, the dragoons had been very good missionaries, and not only weavers but great captains like SCHOMBERG were expatriated. It was in vain men of experience such as Marshal VAUBAN besought the king to be tolerant and to be equitable in raising taxes. The great military engineer was treated as if he had committed sacrilege, and his admirable book on taxation, "La Dîme Royale," was hung in the pillory. The successors of LOUIS had to suffer through the misgovernment of the king, but it will always be assumed that he made France supreme in Europe, and on that account his memory will always find idolaters. LOUIS XIV. was entitled to have a position on the walls of the Luxembourg, for he purchased the buildings from the Princess ELIZABETH OF ORLEANS in 1694. At the time it was known as the Palais d'Orléans, a title which superseded its original name, Palais Medicis. The name Luxembourg originated with a duke called PINEY-LUXEMBOURG, who had purchased a mansion which stood on the site before it came into the possession of MARIE DE MEDICIS.

Whether they belonged to the Capets, the Valois or the Bourbons, the French kings were compelled to be familiar with war. NAPOLEON I. was not therefore out of place amongst them, for he only continued the tradition of PHILIPPE AUGUSTE, or, as an outsider, of JOAN OF ARC. Without war many Frenchmen think their country could not endure, and hence the prominence of military scenes in the decoration of public or private buildings.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE concluding meeting of the session 1901-2 was held on Monday evening, June 23, Sir William Emerson, president, in the chair.

The PRESIDENT delivered the following address on the presentation of the Royal Gold Medal to Mr. T. E. Collcutt:—

I have to perform the most pleasing duty which falls to the lot of the President of the Royal Institute of British Architects, namely, to present to a distinguished colleague, a member of the profession and of the Institute, the King's Gold Medal.

This medal is the greatest honour the Institute has in its power to confer on those who have distinguished themselves by their work, or in furthering the art of architecture. The first to whom it was given was Charles Robert Cockerell in the year 1848, and the last was Professor Lanciani in the year 1900. In 1901, owing to the death of our late beloved and lamented Queen, it was not awarded at all. Since then His Majesty the King has, as you all know, graciously signified his intention to continue its presentation. Amongst the list of those who have received the medal are a large number of our most distinguished brethren, and also a number of eminent foreigners, for this Institute is not narrow-minded, but cosmopolitan in its views. Amongst the recipients are the names of Cockerell, Barry, Donaldson, Smirke, Scott, Viollet-le-Duc, Pennethorne, Wyatt, Street, Pearson, Penrose, Garnier, Hunt, Leighton, Aitchison, Bodley, Lanciani. And I think, gentle-

men, that you will agree that the name of Thomas Edward Colcutt is a fitting addition to such names.

The presentation of this medal conveys the recognition that the recipient's life in the cause of our noble art has not been passed in vain, and that the profession appreciates the services he has rendered in the advancement of the art of architecture, and that the King ratifies and endorses the view taken of the work he has produced. In the architecture of the moment there is much to make us hopeful, and that this medal should be presented to Mr. Colcutt is an indication that the feeling in regard to architecture just now is distinctly against a slavish reproduction in our modern work of old examples, and also equally against the foolish ignoring of all precedent as a means of arriving at original productions. Mr. Colcutt has evidently carefully studied and reflected on the best examples of both Classic, Gothic and Renaissance work, and has thus marked out a distinctive line or path for himself. This is evident in such works as the Wakefield Town Hall, the Imperial Institute and the City Bank on Ludgate Hill. I reiterate that this freedom from the trammels of precedent, coupled with study of precedent, is the most hopeful sign for the advance of architecture in this century. It is well done that His Majesty should confer the honour of the Gold Medal on our distinguished confrère, Mr. Thomas Colcutt, for in so doing the cause of our art is, I think, greatly helped forward. Though you all well know Mr. Colcutt's work, the following is a list of some of his most important productions, and the order in which they were carried out, commencing in 1872 with the Blackburn Free Library—and in following years the Wakefield Town Hall, the Imperial Institute, the P. and O. offices in Leadenhall Street, the City Bank (Ludgate Hill), the Beckstein premises and hall, Lloyd's Registry of Shipping, besides the decorations of many of the saloons of the P. and O. steamers and a number of country houses and business premises. In all these works there is a most distinctive character and artistic feeling, combined with much originality of treatment, yet without any evidence of straining after such originality, and affectation is entirely absent from all his work.

Mr. Colcutt, I have the distinguished honour of handing to you the King's Gold Medal for architecture, and heartily congratulate you on the honour so conferred upon you, and most heartily wish you further success, and a long life and health to enable you to continue your work in the future.

Mr. COLCUTT, in reply, said:—I beg to thank you, sir, most heartily for the kind terms in which you have spoken of me and my work, and to express to the members of the Institute my heartfelt appreciation of their goodwill towards me in suggesting my name to His Majesty the King for the honour of being Royal Gold Medallist for this year. The Gold Medal was founded for the promotion of architecture, and although I cannot lay claim to having aided this desirable object, I can yet be proud of being a member of this Institute, which, in my opinion, has undoubtedly done very much for the promotion and encouragement of our art. I think the Institute more than any other body has been instrumental in encouraging a diligent study of architecture. It has aimed at fostering a high ideal in the minds of our students by assisting them to a knowledge and appreciation of the best examples of ancient architecture. It is satisfactory to observe that students have been eager to profit by the advantages offered to them in the form of annual prizes, medals and studentships. The drawings and sketches submitted in competition for these prizes are marvels of patient, diligent and artistic study—study ranging from the purest Classic to the Mediæval and almost to the Victorian age. Now, sir, in my opinion this work of the student is laying the foundation of a wide knowledge that will enable him to deal with his real work in a scholarly, catholic and artistic manner, and also to meet the demands of modern requirements in the spirit in which the great masters designed and built. The Institute has also promoted the advancement of architecture by the encouragement it gives to the study of the art of building as well as to the fine art of architecture. Our examinations deal very largely with the various details of construction and with the many mechanical trades that go to the forming of a building, and no student can be fully equipped for his future work in life unless he is a builder as well as a designer of architecture. In this way I think the Institute has done more for the promotion of architecture than it would have been possible for individuals to do, however distinguished they may have been. And now, sir, while thanking you for the honour you have done me, I wish to add that the natural and, I think, excusable feeling of elation with which I learned that the King had graciously sanctioned your recommendation was not untempered by sadder thoughts. I allude, sir, to the most sincere regret and sorrow felt by us all, that one whom we unanimously wished to honour was suddenly taken from among us before the distinction we intended could be conferred upon him, and alas! before his great work was finished. Only a few weeks before the death of Mr. Bentley I had the privilege, together with other friends, of being conducted by him over his magnificent cathedral.

That work, so far as the interior is concerned, is left unfinished, not much more than a shell, but a very noble shell. Both architects and public have sustained an irreparable loss. We shall not now see the outcome of that definite co-operation of the architect and painter-mosaicist, a co-operation which justified us in expecting the most noble results, because, though rarely seen, it is founded upon a true principle. Let us fervently hope that whatever decoration of the domes may be decided upon, it will be entrusted only to those who have a knowledge and feeling and enthusiasm for the architecture of the building. And also may we hope that sufficient funds may be forthcoming to complete this great architectural monument in a manner worthy of the genius of him who designed it. Sir, I am deeply grateful for the honour done me in placing me on the roll of the gold medallists. There may be many more deserving of this honour than I, but there is not one who has more earnestly wished to further the cause of our art.

At the conclusion of the business Sir W. Emerson addressed the meeting. He said:—After so many years of intimate relationship with the active work of this great Institute, I have this evening, in a way, to say good-bye to you and to my valued friends and colleagues on the Council, for after leaving this chair you all know that your presidents cease from active work in connection with the Institute's affairs. In now vacating the honourable position in which you so kindly placed me three years ago, I can only assure you that I have deeply appreciated the confidence and honour you reposed in me by entrusting the guidance of the Institute to my hands and head. If in any respect I have failed to give you satisfaction or disappointed your expectations, I pray you to forgive me; if, on the other hand, you think that I have added in any degree (as I have ever endeavoured to do) to the interest or influence of the Institute, all I can say is that I am truly thankful, for that has been my one and only aim, and the feeling that has prompted all my efforts in acting in the capacity of president. I have always felt that this Royal Institute should be the real and only representative body of architects for the whole of the British Empire, and my conviction is that it will fast become so if we are true to ourselves, strong and not wanting in *esprit de corps*. If we let our voice be heard, with no wavering or uncertain sound, on all important matters relating to our art and our profession, before many years have passed the Institute should hold the influential position it ought to do, and there should be scarcely anyone worth calling a member of the profession who would care to stand aloof. As it is, I think it must be somewhat of a selfish feeling which prevents men of standing in a profession from assisting their brethren by adding their influence and power to the representative body of that profession, so as to assist in upholding the common interests and strengthening the position of those following their own calling. With divided ambitions and counsels the profession will be weak, and will be dictated to instead of dictating. With unity we shall have influence and strength, and shall be less subjected to the humiliating circumstances we occasionally have to deplore in the dealings of employers, whether public bodies or private individuals, with the architectural profession. Above all things, we must not let our selfish interests cause doubtful lines of conduct to be entered upon. This has, I fear, been the case occasionally even amongst those who have been loud in their condemnation of unprofessional conduct in others. Let us above all things be honourable gentlemen, straightforward, firmly joining together in leading this great Institute to a position of respected influence that cannot be gainsaid. And now, gentlemen, I wish you all farewell. To my colleagues I can only say that when I first became a member of the council some sixteen years ago I hardly knew any of the members; now I feel that I am leaving many friends for whom I have learned to have the greatest regard and respect, and, indeed, I trust the feeling is reciprocal. You can understand, therefore, if I feel a little sad to-night, notwithstanding that I am laying aside a burden of responsibility which has sometimes weighed heavily upon me. I thank you all, colleagues and gentlemen, for your wise counsel and kindly help, and for the loyal and constant care with which you have aided me during my term of office. Mr. Aston Webb has now to take over the badge and chain of office as your future president. In handing them over to his care I do so with the certainty that under his guidance the Royal Institute of British Architects will give forth no uncertain sound, and will increase in numbers, influence and prestige.

Mr. F. C. PENROSE, F.R.S., D.Litt., D.C.L., past president, said he was sure he should have the agreement of the meeting in proposing that the thanks of the Institute be accorded to Mr. Emerson for his action as president during the three years he had held the office. His strong, well-considered rulings had in every case been useful to the Institute, and doubtless his judgment would now be bequeathed to his successor, in whom they had every expectation of satisfactory work in the strong and clear course that should be followed for the benefit of the Institute. Members must all desire to thank Mr. Emerson, too, for the admirable addresses he had delivered

during his term of office, and for his final word of benediction to the cause of the Institute.

Mr. ERNEST GEORGE asked leave to second Mr. Penrose's vote of thanks to the President, who had conducted the affairs of the Institute for them in so marvellously wise and kind a manner. One felt that his judgment had been good in all matters that had been brought before him, and he had used his energy for them always in a most courteous, kind and thoughtful manner. They had very much to thank him for, and said good-bye to him in his capacity as President with the greatest regret, tempered only with the knowledge that Mr. Aston Webb was to follow him, and that all Mr. Emerson had been doing would be carried on with equal judgment and wisdom by Mr. Webb.

Mr. JOHN SLATER, vice-president, having formally put the motion to the meeting, the vote was carried by acclamation, and briefly responded to.

### THE USE OF THE BEAUTIFUL.

A COLLECTION of about fifty pictures has been obtained for exhibition at Fountainbridge, Edinburgh. Most of them were painted by Scottish artists. At the opening of the exhibition, the Rev. Dr. Cameron Lees delivered an address. He said they had before them a loan exhibition. People who were the fortunate possessors of good pictures had sent them there to give pleasure and to be of use to others. He was afraid that most of them only cared to part with what they found in some measure superfluous, but the generous lenders of these pictures had parted with treasures that were very precious to them, and they had parted with them for a time in the hope that they might give pleasure to others equal to that which they themselves had received. What was the pleasure in gazing upon things that are beautiful he need not enter into. What was the beautiful itself had been an object of contention among metaphysicians in all ages. Some had said that the essence of the beautiful was an innate feeling in their own hearts. Others had said that the beautiful consists in certain qualities that belonged to the object that they looked upon, and others had resolved the beautiful altogether into utility, saying that that only was beautiful that was useful and which fulfilled the end for which it was made. He was not going to enter into these subtle disquisitions. For his own part, he was entirely with Wordsworth, who believed that the beautiful consisted in a certain mystical, spiritual element with which they were brought into contact—that there were three great aspects of the infinite perfection, the true, the good and the beautiful, and that when they came into contact in any way with the beautiful, however much they derived pleasure, it was in being brought to the fringe of a mystic and spiritual world, of a something deeply interfused, whose dwelling was the light of setting suns and the round ocean of the living air. Nor could they forget that Our Lord Himself seemed to have regarded, certainly in His parables, outward things as the images and the types of a higher and a spiritual world, and that He saw in the flowers the emblems of a mystic beauty greater than the glory with which Solomon was arrayed. But however that might be, whatever might be the pleasure that they derived from the beauty of nature or from the beauty of art, it was a great thing that they were able to share it with others. It was a great thing, he thought, that in that district where men were engaged continually in the labours of common life such an exhibition should be opened. He was sure he expressed the hope of those who had so generously lent the pictures that the exhibition might have a refining element, and that it might not merely have a refining element, but that it might give real pleasure to multitudes of people. He thought if he expressed their feelings it would be in the words written over the Royal Academy in London, which they hoped might be true even of that lesser effort—

The hearts of men which fondly here admire  
Fair seeming shows, may lift themselves up higher,  
And learn to love with zealous humble duty  
The eternal fountain of that heavenly beauty.

### CONWAY CASTLE.

IN a letter to the *Times* Mr. C. H. Bothamley writes:—I beg to be allowed to call attention to a danger which at present threatens one of the most interesting parts of the ancient castle at Conway, hitherto one of the most valuable of Mediæval relics, partly by reason of its intrinsic interest and partly because it has in the past escaped the devastation of the restorer and rebuilders. Unfortunately, unless active steps are taken in its interests it will not longer enjoy this good fortune. The Town Council of Conway, with, it is stated, the approval of a public meeting, has decided to celebrate the Coronation of His Majesty the King by "restoring" what is called the

Queen's or Eleanor's tower in the castle. This is the north-east tower, which contains on one floor the well-known oratory with its attached side-chambers and, on the floor above, the great fireplace and window recess of an apartment of unusual magnificence for its date and position. In general character and arrangements this tower is in fact unique amongst the many remains of Mediæval military architecture in this country. A public appeal has been made for subscriptions with a view to raise the sum of 500/, which it is estimated the proposed restoration will cost; and it is obvious that with such a sum a great amount of mischief may be done. In support of this appeal it is urged that the tower is of national interest, and that it has fallen into a very ruinous condition. The first statement is certainly true, but provides the strongest argument in favour of keeping the tower as nearly as possible in its original condition; the second statement is also true if it means that the ornamental detail of the oratory has practically all perished, but is open to great doubt if it is intended to refer to the fabric of the tower. Probably some pointing and, perhaps, some grouting would be advantageous; but both internally and externally the tower itself seems to be quite sound, some repairs that were necessary in the interior having recently been well carried out by Mr. De la Motte, the borough engineer and surveyor. I submit that anything beyond the work necessary to insure stability would be sheer vandalism, and would destroy for ever the great interest which now attaches to this tower.

I was unable to ascertain in Conway exactly what it is proposed to do, and I gathered that no definite scheme had been framed a few weeks ago; but it will illustrate the kind of thing that may happen if I say that one of the proposals that have been discussed was to put into the tower a floor and a roof, so as to provide a shelter room for trippers. Fortunately this proposal met with much opposition.

It is still true that "the castle and town of Conway form together the most complete and best preserved example of Mediæval and military architecture in Britain;" but it will not be denied that the castle owes very much of its attraction and interest to the fact that, so far, it has not been disfigured by unnecessary rebuilding, nor by the erection of accommodation for trippers, which makes such eyesores at other places of the same kind. It is with a desire to prevent any such misfortune that I venture to call attention to what it is proposed to do, and to express a hope that not only may the appeal for subscriptions for this purpose meet with no response, but that sufficient influence may be brought to bear on those concerned to lead to the abandonment of the proposal and the adoption of some other method of celebrating the chief event of the year. To do irreparable injury to the grandest monument of Edward I. would surely be a most unfortunate way of attempting to do honour to Edward VII.

### THE ST. LOUIS WORLD'S FAIR.

THE United States Congress have agreed to an amendment authorising the postponement of the opening of the World's Fair, formerly fixed to be held at St. Louis in 1903. Under this enactment it will be opened on May 1, 1904. One of the principal reasons for delay is that the plans originally fixed for this universal exhibition, organised to commemorate the purchase of the great territory of Louisiana, have been much enlarged. As one State after another appropriated money for exhibits, it became apparent that more time for preparation was necessary. The most important argument in favour of a postponement was that presented by foreign countries, and the additional year will be used for improving the quality of the exhibition rather than for enlarging its scale. Assurances were received from nearly all foreign countries, as well as from many States of the American Union, that the postponement would be most welcome to them. Meanwhile work has been going on steadily. The commission from France has already visited St. Louis, and the Chief Commissioner from Canada, Mr. William Hutchison, has also been and made his preliminary arrangements. The Dominion has made a first grant of 125,000 dols. for its buildings and exhibits. Four of the largest buildings, covering a space of nearly a mile, are already under construction, while the work upon the grounds is proceeding as rapidly as possible.

The Late Mr. C. Gassiot, it is again announced, has bequeathed to the trustees of the National Gallery one of his pictures by Patrick Nasmyth, one of his pictures by William Collins, R.A., two pictures *The Prison Window* and *The Gossips at the Well* by John Phillip. He bequeathed the remainder of his pictures, excepting family portraits, to the Corporation of the City of London for the Guildhall Fine Art Gallery. A sum of a quarter of a million will probably be acquired for the benefit of St. Thomas's Hospital.

### NOTES AND COMMENTS.

FRENCH designers and modellers must be inspired to attain perfection when they find that the foremost artists are willing to take part in assessing the value of their work. The Society for the Encouragement of Art and Industry lately offered prizes for the decoration of a serrurerie, or, in other words, the lock-plates of a folding door. The Minister of Public Instruction and Fine Arts gave his aid, and among the jurors who accepted the duty of examining the designs were M. ROTY, the medallist; M. VAUDREMER, the architect; M. GÉROME, the painter, and several other artists. No less than 292 designs were sent in from Paris and various provincial cities. The first prize was bestowed on a student of the school of industrial arts in Rheims. Rouen carried off three prizes. Students from Rennes and Lyons were also successful, and there were eight Parisians to whom premiums were awarded. In this case, as in others like it, everything is voluntary, and yet it is asserted that nothing can be done in France unless by officers of some administration. In England, on the contrary, where freedom prevails, the prizes to students in schools of art are given on the reports of official examiners who have very little liberty of action. As a consequence, the students' works are remarkable for monotony.

EFFORTS are being made in Paris to obtain more recognition for the designers and modellers who produce the examples of the subsidiary arts which are now seen in the two salons. It is only of late years that the scope of those exhibitions has been widened. At one period in the older salon of the Society of French Artists nothing was to be seen but paintings, statues, architectural drawings, engravings and a limited number of water colours. The second and rival salon from the first showed some recognition for minor arts, and as time went on more variety was permitted. The arrangement has been advantageous, for the statuettes, jewellery and pottery gave more interest to many of the visitors than the works which alone are supposed to be examples of fine art. But as the examples of industrial art were exhibited in the names of vendors the creators, whether designers or modellers, have remained unnoticed. In other words, capital has carried off the honours from invention. That is a result which is contrary to French principles. The humblest man expects to derive a little *éclat* from his work, and a designer who probably has devoted much time and thought to a creation in metal, clay or wood feels he has as much claim on the attention of the public as a painter or a sculptor. The younger Society has evinced an inclination to do justice to the craftsmen, but the older body as usual creates difficulties in order to gain time before coming to a decision. Credit must be given for any success that has been met with by the art workmen to M. FRANTZ JOURDAIN, the architect.

In England we assign the credit for the first application of coal gas to lighting to WILLIAM MURDOCH, who had so far succeeded in 1798, he was allowed to illuminate the works of BOLTON & WATT at Soho, near Birmingham. LEBON, a Frenchman, patented the employment of gas in 1799. It is now claimed that MINCKELERS, who was a professor of physics in Maestricht, had ascertained the utility of gas at an earlier time. He published a pamphlet in which he announced that on October 1, 1783, he was able to obtain a cubic foot of gas from 4 oz. of coal. In the same year his gas was used for filling some small balloons, and in 1785 his lecture-room was illuminated with "burning gas out of distilled coal." On account of the priority of his discovery an effort is now being made to erect a memorial of MINCKELERS, who also, it is said, found out a method of purifying gas by means of lime. Holland has not produced many men who were capable of applying science to practical uses, and few will care to dispute the claim of MINCKELERS. But all important inventions or discoveries appear to have occupied the attention of several men at the same time.

FRENCH law concerning accidents to employés is as uncertain as our own. A notable instance has been afforded. In December last at a rehearsal in the Variétés Théâtre, Paris, a staircase which was meant to resemble

CHARLES GARNIER's in the Opéra House suddenly collapsed, causing serious accidents to some of the performers. The sufferers brought actions against the director, M. SAMUEL, and succeeded in gaining damages. Damages were also awarded against the stage-carpenter, who had not fixed the structure in a safe manner. The latter cast all the responsibility on M. SAMUEL. The case was brought before the Court of Appeal in such a way that the whole of the circumstances could be fully investigated. M. SAMUEL was supported by several of the directors of Paris theatres, and they testified that the stage-carpenter or machinist should have warned the director and explained to him the condition of the structure. The President of the Court, with the other judges, quickly decided in favour of M. SAMUEL. The judgment is sufficient to reveal the variability of French law, but it would be no doubt set aside in another court, and, in fact, the game of legal see-saw could be interminably carried on.

It was well said by THÉOPHILE GAUTIER that the Alcazar, or palace of CHARLES V., at Granada, would merit admiration if it were found in any other position; but it can receive only execrations when it is known that to gain a site it was necessary to demolish some of the charming buildings of the Alhambra. The palace was designed by PEDRO MACHUCA and the decorations by ALONZO BERRUGUETE, who was a painter and sculptor as well as an architect. The trophies, bas-reliefs and medallions of the façade are vigorous examples of ornamental sculpture. The circular court with its marble columns is magnificent, but *non erat hic locus*. The building was never completed, although it was over a century in the hands of workmen. Once more there is a chance of resuming the operations which were abandoned in the seventeenth century. By a royal decree a competition has been opened for the preparation of plans, which is, however, restricted to Spanish architects. The drawings are to be submitted in November. Foreigners, at least, will hope that it will not be needful to have another destruction of Moorish buildings in order to realise the selected project.

THE proposed restoration of Conway Castle has excited alarm, especially as it was believed the work would be conducted by the Town Council. A letter was lately addressed to the town clerk from the Society for the Protection of Ancient Buildings, in which it was urged that if the Mayor and Corporation have decided to restore the Queen's Tower they ought to reconsider the question, inasmuch as this tower is quite the most valuable remaining portion of the ruins of Conway Castle, a building almost without an equal of its class. The addition of new work, which is not purely work of upholding, must necessarily detract from the historical and artistic value of this exceptionally interesting building. Posterity will certainly regret any such additions, and public opinion has already so largely changed that the Society feel sure even now the action of the town, if it attempt to "restore" this building, will meet with strong disapproval from a large section of the public. One of the members of the Council said they never contemplated anything beyond works of protection. The fact that Messrs. CLARENCE WHAITE and HAROLD HUGHES, two of the highest authorities on art and historical architecture in the country, had been consulted in the matter would be a sufficient guarantee for the spirit in which the Council approached this question and the object they had in view. Other members concurred. It was not, however, stated under whose direction the protective works were to be carried out.

## BAYHAM ABBEY AND SCOTNEY CASTLE.\*

ROBERT BURNS has told us that the best laid schemes of mice and men gang aft agley, and it has happened so with us, or at the present time we should have been in the vicinity of Leeds Castle. But Leeds was a large barony, and it curiously happens that most of the ground we have traversed to-day formed one of its limbs. At Leeds and at Hollingbourne the Culpepers were important men, and the story of Lamberhurst and Pembury is more or less associated with them.

One writer spoke of the ubiquitous Culpepers, and John Philpot, who was Somerset Herald in 1657, when editing Camden's "Remaines," wrote:—"I have noted at one time there were twelve knights and baronets alive of this house together." In his "Barons' Wars" Drayton wrote:—

And Culpeper, in silver arms enrailed,  
Bore thereupon a bloody bend enrailed.

Enrailed signifies that the edges of the bend or band were indented or serrated. To-day Burke and Debrett know them not, and their arms are only seen on the old memorials in village churches.

Lamberhurst is partly in Kent and partly in Sussex, the counties being separated by the little river Tyse, or Teise, which is a branch of the Medway. Mark Antony Lower gives the derivation as Lambru, the Anglo-Saxon for lambs, and Hyrst, a wood, suggesting that the pasture land was especially suited for lambs. Edward Hasted, however, associates it with the soft clay or loam.

The manor of Lamberhurst, forming part of the Leeds barony, originally belonged to the Chevequers. A portion of it was let to Sir Nicholas Lenham, who obtained a charter of free warren and other rights from Henry III. The Chidcrofts succeeded them, and as the Culpepers were then in possession

marriage to Sir John Hanby. From their only child, a daughter, it passed by marriage to John Chaplin, and by the marriage of his daughter it came to the possession of Edward Ayscough, who alienated it in the reign of George I. to William Morland. In the hands of the Morlands the manor remains, and the manor house, known as Court Lodge, which was built of materials from Scotney Castle, stands in the picturesque park, which has gradually grown round the village church.

The church is dedicated to St. Mary; the oldest portion is the Early English arch which separates the chancel from the Scotney chapel. The window at the east end is Perpendicular; the carved pulpit bears date 1630. A grand old yew tree adorns the garth on the south side. The vicarage, a handsome Elizabethan building, is a little to the north of the park gate.

BAYHAM ABBEY.

William Cobbett, in his "Rural Rides," describes Lamberhurst as "one of the most beautiful villages man ever set his eyes upon," and to-day we have seen it at the most favourable season of the year. As a manufactory it has played its part, for here was the most important of the Sussex ironworks. Princess Anne, daughter of James II., visited it with her little son, William Duke of Gloucester, and in his honour it was named the Gloucester Furnace. The old balustrades for St. Paul's Cathedral we may believe to have been cast there, though for the furnace at Mayfield the honour is claimed. The weight of the railings was stated to be 200 tons, and they cost 11,202*l*. Less pleasant is it to note that cannon were also cast there, and many of them were smuggled across the channel to be used against the English by the French privateers. Some incidents of the Boer war have shown us how history repeats itself. The furnace is now represented by part of the foundry walls, a cottage which was formerly the counting-house, and the pond.

SCOTNEY CASTLE.

of the Leeds barony, the Chidcrofts assumed their arms, an old-time custom that was not at all unusual. The other part of the manor in the reign of King John was held from the Chevequers at half a knight's fee by Nicholas de Kenneth, who gave it to the Abbat and Convent of Robertsbridge. Hugo de Chevequer confirmed the gift, and received from the Abbat 35 silver marks. Many disputes arose between the Archbishop of Canterbury and the Abbat, but their differences were finally settled in 1216, though to this day the church is in the diocese of Canterbury, while the living is in the gift of the Dean and Chapter of Rochester. At the Dissolution the manor was granted by Henry VIII. to Sir William Sidney and Anne, his wife. Sir William was buried at Penshurst. In the reign of James I. the property was alienated to John Porter, and by Elizabeth Porter, the last of the line, it was conveyed by

\*. A paper by Mr. Harradence, read before the members of the Upper Norwood Athenæum.

George Alexander Cooke, writing of Scotney Castle, stated that "it borrowed its appellation from its local situation and overshooting of the water." The word Scotch has various meanings; one is to cut with shallow incisions, and the devious course of the Bewle may probably have suggested the name. Skotos is also a Greek word signifying darkness, and here may have been one of the densest and darkest parts of the forest.

The castle, according to Edward Horsfield, was built in the time of Stephen, and probably it was strengthened during the barons' wars. In the reign of Henry III. it was held by Walter de Scoteni. Edward de Hadenham has recorded how Walter was accused of administering poison to Edward Duke of Gloucester and his brother, William de Clare. For the offence he was tried, and found guilty, and after being drawn through the streets of the city of Winchester he was there hanged. The Scotneys died out about the middle of the reign of Edward III., and the property passed to the Ashburnhams. Roger Ashburnham, who resided there, was a Conservator of the Peace, and by permission of Richard II. he was permitted to further fortify the castle. By one of his successors it was alienated to Henry Crichley, Archbishop of Canterbury, and one of his mandates was dated Scoteneye, April 3, 1418. He gave it to his niece, Florence Crichley, as a dower on her marriage with Joseph Darrell, of Cale Hill, and in the possession of the Darrells it remained until in 1774 it was alienated to John Richards, who sold it to Edward Hussey. The old castle had four round towers; one only remains. The machicolations can still be seen. Two uprights of the gatehouse also remain, and the entire moat. A later house was built by Inigo Jones, and the present mansion, built by Salvin, is the residence of Mr. E. W. Hussey, by whose kind permission we visited the ruins.

Bayham Abbey is situate in the parish of Lamberhurst. It has been variously known as Beaulieu, Bageham, Beigham and Bayham, from the beautiful spot on which it was reared. A stone tablet, among other particulars, tells us that "Ela de Sackville, daughter of Ralph de Dene, founded this Priore in honovr of St. Marie in the reign of K. Richard ye First." The owner of the land was Sir Richard de Thornham, who fought with King Richard in the Holy Land, and returning to England, placed Beaulieu at the disposal of the Premonstratensian canons. This order was founded in 1120 by St. Norbert, Archbishop of Magdeburg, and was much stricter than the rule of St. Austin, of which it was a branch. Their first settlement was at Pré Monré, and in 1140 they made their way to Lincolnshire, where they erected an abbey known as Newhouse. They wore a white cassock, a rochet and a white cloak, and were generally termed the White Canons. Other houses were established by them at Brockley and Otham, but the land there was so poor that the monks vacated their quarters, and the Brockley canons joining them, the beautiful abbey of Bayham was reared. Mr. A. J. Beresford-Hope writing of them said "they were a strict sect, who wanted no congregations and cared for no processions, so they built their church like a long room." From east to west Bayham measured 257 feet, the width being 24 feet. The choir was extended into the

SCOTNEY CASTLE.

nave, so that with the transepts and chancel it formed a cross. The string-course in the western portion of the choir shows where the stalls of the canons terminated. The eastern limb of the cross is unusually short and it terminates with a trigonal apse, a particularly rare feature. A gracefully-designed and beautifully-executed cluster of foliage in the nave tells of the loving labour that was given to the church. There were no aisles and the doorways on the north and south sides were formed to communicate with the transept by passages. In each transept there were two eastern chapels, and those on the north side still retain their vaulting. Two other chapels were on the south side between the nave and the chapter-house, which had three aisles. Some of the penitential cells, the gatehouse and a stone coffin with a sculptured cross still remain. Dugdale only tells of six of the abbats—Robert Frendesbury, 1405; John, 1413; Thomas Cottingham, 1475; Robert Hertley, 1478; Robert Nash, 1488; and Richard Bexley, 1494. Though the ordinary public were not admitted

to the abbey, pilgrims were ever welcome, and among the distinguished visitors was Edward I., who was entertained in 1299, and Edward II., in 1324. Richard, the sainted Bishop of Chichester, was also one of their guests, and the bed he slept on was long celebrated for its healing power. The strictness of the monks seems to have gradually slackened, for when Bishop Redman visited them in 1488 he complained that they were holding cures and were wearing "pykes" to their shoes like fops. They were popular with the neighbouring peasantry, however, for when Henry VIII. handed over the abbey to assist Cardinal Wolsey in founding his colleges at Oxford and Ipswich, the people defended the monks and carried them back to the abbey from which they had been expelled. For this act the Abbat and canons were arrested and their protectors were punished. Wolsey's fall soon followed, and as the colleges were not fully founded Henry claimed Bayham. By Elizabeth it was granted to Anthony Brown, Viscount Montague, and his descendant Ambrose Brown sold it in 1714 to John Pratt, who became Lord Chief Justice. While in his possession the roof of the abbey was removed for

SHOP, LAMBERHURST.

the sake of the materials. His son Charles, on July 17, 1765, was raised to the peerage by the title of Lord Camden of Camden Place, co. Kent. In 1766 he was appointed Lord High Chancellor of Great Britain, and on May 13, 1786, he was advanced to a viscounty and earldom by the titles of Viscount Bayham of Bayham Abbey, and Earl Camden. His son, John Jeffreys Pratt, was the second earl, and on September 7, 1812, he was created Earl of Brecknock and Marquess of Camden. By the third marquess the present mansion was built, and as a memorial to his father he erected the little church. The earlier mansion stands on the low ground west of the abbey church, and was built from the materials of the demolished abbey. It is now the residence of the Rev. J. H. Savory, chaplain to the marquess. By permission of the fourth marquess we were permitted to visit the ruins to-day.

No historian of the county, or philologist, so far as my search has extended, has hazarded a suggestion regarding the meaning of Pembury. But when we note that in the Textus Roffensis it is called Peppingeberia, and in ancient deeds Pepenbury, the thought arises that it may have had something to do with the Culpepers, who had their home there at Bay Hall. The church, dedicated to St. Peter, originally paid ninepence a year to the cathedral at Rochester, which was termed chrim rent. Pembury with other manors was bestowed on the Abbat of Bergham by Simon de Wahull, on condition that one canon celebrated mass there daily, and he bequeathed his body to be buried in the abbey church. By his bull, dated November 10, 1239, Pope Gregory IX granted license to the Abbat of Bayham to hold the church. Richard Oliver, the rector, declined to give up possession, and not until 1278 was the Abbat inducted. In the twenty-eighth year of King Edward II. John Culpeper was granted permission to build a chantry chapel, dedicated to St. Mary, in the churchyard, and in the reign of Edward III. he is believed to have rebuilt the church. On the three buttresses on the south side of the chancel are three shields—the first bears a rectangular cross, the second has the Culpeper arms, and the third has the arms of his wife's family, the Hardreshulls. An old stone of the chancel pavement has an inscription in old French to Margaret, daughter of Sir Thomas Coleperer, who died in the reign of Edward III. The churchyard contains the stone coffin of an Abbat of Bayham. At the Dissolution the manor was claimed by Henry VIII., who gave it to Sir Edward Guildford, knight, Warden of the Cinque Ports. The next owner of importance was Sir Thomas Cromwell, knight, who was made Earl of Essex, Knight of the Garter, and Lord High Chamberlain of England. The Marquess Camden is now the chief landowner.

In addition to the authorities I have quoted, I am indebted to the ordinary county guides, and to various articles by Edward F. Skinner, George Measom, George F. Chambers, W. Stanley Martin, B. Prescott Row, Mackenzie Walcott, E. R. Kelly and other writers.

I have to gratefully acknowledge the kind and continuous co-operation of Mr. Stanley, and though you may consider we are somewhat to blame for arranging a ride instead of a ramble, I think you will acknowledge we have partly atoned for it by giving you a very rambling paper.

The illustrations are from photographs by Messrs. H. G. Quartermain, Henry Virgoe, and Charles Wheeler.

## ANCIENT BUILDINGS IN OR NEAR NEWCASTLE-ON-TYNE.

ON to-morrow (Saturday) the annual excursion of the members of the Northern Architectural Association will take place. They will travel by train to Morpeth, and then drive to Brinkburn Priory. They will next proceed to Craig-side. Afterwards the memorial chancel fittings in Rothbury Church will be inspected, before returning to Morpeth for dinner.

A very useful list of ancient buildings near Newcastle-on-Tyne has been compiled by Mr. F. W. Morgan. Copies have been presented to the Association by Mr. J. W. Taylor, with the hope that they will encourage students to study the buildings referred to. In order to extend the utility of the list, and carry out the donor's intention, we reprint it, with the desire that other societies will endeavour to impart similar information.

### *Roman.*

The Roman Wall and Stations.  
Bridge abutment at Chollerford. Pillars placed in the nave arcade of Chollerton Church.

Stations at South Shields, Lanchester, Ebchester and Binchester.

Arch and stones in Corbridge Church.  
The Collection at The Chesters, Chollerford.  
Incised and Sculptured Stones, Hexham Abbey.  
Relics in the Black Gate Museum and in the Castle Keep, Newcastle-on-Tyne.

Altars and Inscribed Stones in the Dean and Chapter Library, Durham.

### *Pre-Conquest.*

The Towers of Ovingham, Corbridge, Bywell (St. Andrew's), Whittingham, Warden and Billingham Churches.

The Crypt at Hexham and the Church at Escomb (complete).

Tower and west wall of nave, Monkwearmouth Church.  
Jarrow Church tower and chancel  
Portions of Bolam, Whalton, Woodhorn, Heddon-on-the-Wall, Hart, Staindrop and Sockburn Churches.

The tower and transepts of Norton Church.  
The Frith Stool at Hexham, Two Crosses in Ayckley churchyard.

Crosses and Sculptured Stones in the Dean and Chapter Library at Durham.

### *Norman.*

Durham Castle, chapel, 1071-96; doorway of Bp. Pudsey's lower hall and Bp. Pudsey's upper hall.

Durham Cathedral, choir and aisles, 1093-96; nave and aisles, 1099-1128; Galilee chapel, circa 1175.

Edlingham Church, nave arcade, chancel arch, south door, &c.

Edmundbyers Church, Choir of Coldingham (late).  
Brainshaugh Chapel, Acklington.

St. Andrew's Church, Newcastle, lower stages of tower, part of nave arcades and chancel arch, 1175-85.

Ponteland Church, west doorway and lower stages of the tower.

Heddon-on-the-Wall Church (chancel), and parts of Rock Church.

Newburn Church tower (early), and Whickham Church nave arcade.

Warkworth Church, chancel and greater portion of the nave.

The Keep of the Castle, Newcastle (the whole, with the exception of the modern battlements).

Bamburgh Castle Keep (latter part Henry I.), most of Barnard Castle and part of Alnwick Castle.

Naves of Mitford Church and St. Margaret's, Durham.

Parts of Brinkburn Priory (Transitional), Prudhoe Castle, and the oldest parts of St. Mary's Chapel, Jesmond.

Corbridge Church, south aisle (temp. Henry I.).  
Elvet Bridge, Durham (end of twelfth).

Pittington Church, arcade of nave. Part of Tynemouth Priory.

Bellingham Church (end of eleventh century), and chancel of St. Cuthbert's, Haydon Bridge, circa 1190.

The whole of Lindisfarne Priory and Seaton Delaval Chapel.

Portions of St. John's, Newcastle; St. Mary's, Gateshead; St. Giles, Durham, and Barnard Castle Church.

Parts of Seaham and Lanchester Churches.  
Ebchester Church (latter part of the eleventh century).

The great hall (formerly chapel), Auckland Castle, c. 1185.

Darlington Church (end of twelfth or beginning of thirteenth centuries).

Hartlepool Church (c. 1190).  
Eryholme Church arcade (c. 1200).

Transitional  
or  
Pointed  
Work.

### *Thirteenth Century.*

The lower part of the Black Gate, Newcastle, 1247.  
Parts of the Black Friars Monastery and "King John's Palace," Newcastle-on-Tyne.

Hexham Abbey, the whole of (Transitional and Early English).

Durham Cathedral, upper part of the western towers, c. 1220. Chapel of the Nine Altars, 1242-70.

Substantially the whole of Ryton (early), Simonburn, Houghton-le-Spring (first half of century), Sedgfield (all but tower), 1225-50, and St. Andrew's, Auckland (early), Dalton, Easington (except the tower) and Whitburn Churches.

Greater parts of Tynemouth Priory, 1220; Blanchland Abbey Church; Finchale Abbey and Brinkburn Priory.

Transepts of Ponteland Church, and Chancels of Mitford and Corbridge Churches.

Large portions of Ovingham, Medomsley, Chester-le-Street and Holy Island Churches.

Haughton Castle (Ed. I.), Aydon Castle (c. 1250) and the old Tower at Ford (1287).

Tower and Spire of Boldon Church (early thirteenth).  
St. Edmund's Chapel (Holy Trinity Church), Gateshead, complete 1241-48; restored, 1837.

The Town Walls of Newcastle, with the towers (Herber Croft and Corner), thirteenth, fourteenth centuries.

Parts of Hartburn, Whalton, Lanchester (chancel, early thirteenth); Bamburgh, Brancepeth (tower and part of nave, circa 1240); Bywell (2) and Chester-le-Street Churches.

The Lavatory at Hexham Abbey, circa 1280.  
The Great Hall of Durham Castle (late thirteenth).

Staindrop Church Sedilia.  
Parts of Prudhoe, Halton and Ravensworth Castles.

Vicar's Pele Tower, Corbridge Churchyard.

### *Fourteenth Century.*

St. Nicholas, Newcastle, nave and chancel arcades, s. wall recesses and windows, some of the s. transept windows and the crypt.

St. Andrew's, Newcastle, upper stage of tower.  
St. John's, Newcastle, nave arcade and s. aisle.

St. Mary's, Gateshead, nave arcade, c. 1350.  
Belsay Castle (complete, temp. Ed. III.) and part of Ogle Castle.

Ponteland Church, Chancel, c. 1330. Warkworth Hermitage, c. 1340.

Spire of Warkworth Church. Ovingham Church porch.  
Hexham Moot Hall and Manorial Office.

Etal Castle and Edlingham Castle.  
Hunwick Manor House Chapel.

Large portions of Newbiggin and Morpeth Churches.  
Pele Towers at Corbridge and Cocklaw (both early fourteenth).

Brancepeth Church, aisles and transepts, chancel, chape and vestry, circa 1375; and the chest.

The greater part of the work at Alnwick and Raby Castle  
Morpeth Castle (gateway tower) and Dilston Tower.

Langley Castle, c. 1350; the old work at Chillingham Castle, and Halton Tower.

Chester-le-Street Church, octagon and spire (Early Decorated); spire of Coniscliffe Church.

Durham Cathedral, several windows; Bp. Hatfield's tomb and Bishop's Throne, c. 1375.

Durham Cathedral, tomb of John Lord Neville, 1386; Altar Screen, 1374-80.

Durham Cathedral, kitchen of the monastery, 1368-70.  
Bothal Castle, c. 1343. Bothal Church.

Lumley Castle (greater part of), end of fourteenth century.  
Dunstanburgh Castle, 1316-25.

Friarside Chapel, Rowlands Gill. Chantry Chapel, Tynemouth Priory, c. 1335.

Darlington Church, higher stage of the tower and the spire.  
Framwellgate Bridge, Durham; Chester-le-Street and Warkworth Bridges.

Chantry Chapel, St. Cuthbert's Church, Haydon Bridge.  
The Tower of Chipchase Castle, c. 1350.

### *Fifteenth Century.*

Beltingham Chapel, Haltwhistle (complete); Bywell (St. Peter's), lady chapel.

Gateway towers of Bywell Castle and Alnwick Abbey.  
 Hilton Castle, c. 1415. Warkworth Castle (largely).  
 Warkworth Church, s. aisle and porch. St. Michael's  
 Church, Alnwick (nearly all).  
 Sedgfield Church tower, 1425-50. Durham Cathedral,  
 centre tower, 1430-90.  
 St. Nicholas, Newcastle, tower and steeple, and the roofs,  
 c. 1450.  
 St. John's, Newcastle, tower vault and roof.  
 All Saints, Newcastle, Thornton brass, 1429.  
 The Stallwork in Jarrow Church, 1494-1519. The Fonts in  
 St. Nicholas, Newcastle, and Hart Churches.  
 Greater parts of Witton Castle, near Bishop Auckland, and  
 Lumley Castle (early).  
 Cockle Park Tower. The Bridge at Felton.  
 Tomb of Lord Ralph Neville in Staindrop Church.  
 Chancel of the Chapel, Hilton Castle. Part of Hulne  
 Abbey.  
 Brancepeth Church, oak panels of screenwork.  
 Durham Castle, kitchen and buttery, 1494-1501.  
 Oak ceiling in the Priors' apartments (Deanery), Durham.  
 The Rood Screen, c. 1500, Hexham. The Leshman  
 Chantry, Hexham.  
 Gateshead, St. Mary's, nave, roof and north transept.

#### *Sixteenth Century.*

Abbey Gateway, Durham, 1494-1519.  
 Durham Castle, Bp. Tunstall's gallery, woodwork and  
 chapel.  
 Durham Castle, stalls in the chapel, 1509-22.  
 Durham Castle, tapestry (late) in galleries and rooms.  
 Portion of Auckland Castle; transepts of Hilton Castle  
 Chapel.  
 Two or three old houses at West Auckland.  
 Stella Hall, Blaydon. Denton Hall, c. 1503. Horden Hall.  
 Font covers in St. Nicholas, St. John and St. Andrew's,  
 Newcastle.  
 The old Grammar School, Durham, 1541.  
 Old house on "The Bank" at Barnard Castle.  
 The Henry Neville monument, Staindrop. The older parts  
 of Ryton Rectory.  
 Pulpit, Heighington Church.

#### *Seventeenth Century.*

Pulpit in St. John's Church, Newcastle (early).  
 Brancepeth Church, Bp. Cosin's woodwork (early), and the  
 porch.  
 Durham Castle (fireplace in Senate room, 1606-17; Black  
 staircase, 1665); fireplace in keep, Newcastle.  
 Upper part of the Black Gate, Newcastle, 1603-20.  
 Gibside Hall (temp. Jas. I.), Chipchase Castle, 1621. Helm-  
 ington Hall and parts of Hunwick Hall.  
 Welton Pele Tower and part of Dilston Castle.  
 Maddison and Hall Monuments in St. Nicholas, Newcastle,  
 1635-40.  
 Gateshead, St. Mary's, nave stalls, 1634; stalls in chancel,  
 1695.  
 Mifford Manor House, 1637. Hexham Grammar School,  
 1684.  
 Durham Cathedral, choir stalls and canopy of font, c. 1671.  
 Parts of Ogle (temp. Charles I.) and Halton Castles.  
 Chillingham Castle. Late alterations by Inigo Jones.  
 Blackbird Inn, Ponteland. Wallington Hall (late).  
 The Guildhall and its Mayor's Chamber and Merchant's  
 Court, Newcastle.  
 Cox's House, Quayside, and Cross House, Westgate Road,  
 Newcastle.  
 Old Houses in the Side, Sandhill, Bigg Market and Old  
 Pilgrim Street (with staircases, fireplaces, panelling, &c.), New-  
 castle.  
 Fittings in the Chapel of the Trinity House, 1634, New-  
 castle.  
 Brass Lectern in St. Nicholas. The Jesus Hospital, 1683.  
 The Smiths' Hall, 1679, Newcastle.  
 Bp. Cosin's Library, Durham, 1669.  
 Old Houses at Newburn, Corbridge, Hexham, Washington,  
 Tynemouth, Hunwick, Houghton-le-Spring, Hartlepool, Gain-  
 ford, and many other places.  
 Chancel stalls, Ryton.  
 Pulpit, reading-desk, &c., Haughton-le-Skerne Church.

#### *Eighteenth Century.*

Tanfield Hall and iron gates.  
 Ryton Rectory, 1700. Seaton Delaval Hall (by Sir John  
 Vanbrugh), 1707.  
 West Boldon Hall, 1709. Heworth Old Hall.  
 Chipchase Castle (north side).  
 Newcastle-on-Tyne :—  
 Keelmen's Hospital, 1701. Trinity House Hall, 1721.  
 Heaton Hall, 1713. Buildings in the Swirle.

Liberal Club (old Queen's Head), and interior of the  
 Guardians' Offices, Pilgrim Street.  
 Vestry of St. Nicholas, 1736. Porch of St. Andrew's.  
 All Saints Church (by Stephenson), 1786-96. St. Anne's,  
 1768.  
 The Guildhall front. Old Assembly Rooms, 1774-76.  
 Jesmond Manor House, 1721. Fenham Hall.  
 Gosforth House, 1760, by Payne, and No. 55 Westgate  
 Road.  
 Tower of St. Mary's, Gateshead, 1739-40.  
 South Shields (1768), Stockton, Alnwick and Barnard  
 Castles (1747), Town Halls.  
 Sir John Vanbrugh's work at Lumley and Hilton Castles.  
 Upper parts of the Croft and Carpenter's Towers, New-  
 castle.  
 Old houses at Durham, Sunderland, Cleadon, Westoe,  
 Seaton Sluice, Morpeth, Warkworth, Hexham and several  
 other places.

### ARCHITECTURE AND THE UNIVERSITY SYSTEM.

A ROYAL Commission was appointed last year "to inquire into the present condition of the higher, general and technical education available in Ireland outside Trinity College, Dublin, and to report as to what reforms, if any, are desirable in order to render that education adequate to the needs of the Irish people." The official report of the evidence has appeared. Among the witnesses who gave evidence were Sir Thomas Drew, P.R.H.A., and Mr. Arthur Hill, B.E. We reprint Mr. Hill's evidence :—

Mr. Justice Madden: Mr. Hill, you are lecturer in architecture in the Queen's College, Cork?—Yes.

You are a member of the Royal Irish Academy and some other learned bodies?—Yes, of the Royal Institute of British Architects, and a life student of the Royal Academy of London.

What place does the study of architecture occupy in the Queen's College, Cork?—The lectureship was created by the Council, without any powers of appropriation of salary or making of any other arrangements. I lectured for two years, in 1894 and 1895. The third year, the number of bona-fide students presenting themselves was very small—only two or three at most—and it was not worth while carrying on the lectures for these students, because they got no credit for it in their examinations. One could not ask students to give up their work in the engineering course, where their responsibilities lay, to study a subject for which they could get no credit.

These were engineering students as a rule?—As a rule, and one or two who attended the course were men who were studying architecture—architects' assistants.

The study of architecture forms no part of the curriculum?—Except on paper.

How do you mean on paper?—It is included in the prospectus of the college.

Are students examined in architecture?—There is an examination in architecture which forms part of the first or second year's course in engineering, and that is carried out by the professor of engineering.

You are prepared to offer us some suggestions as to the position which you think should be occupied by the study of architecture and the profession in architecture in a university system?—Many years ago, when I took my degree in the Queen's College, Cork, and then went to London, I found that the young man studying architecture had absolutely no systematic course of study. I wrote a paper at the time, which was read at a conference of architects held in London in 1874. It was called "College Training for Architects." My proposal was that the architect should be put on much the same footing as the engineer in the university. There should be a professor of architecture in every university where there is a school of engineering. The two professions should run together. It would certainly improve our engineers. Some higher idea of a sense of beauty would be no harm to them, and the association of the artistic temperament of the architect with the practical work of the engineer would be a benefit to architects; and there is no reason why the two professions could not be worked together in that way. The condition of affairs is this. In 1887 the Royal Institute of British Architects, as representing the profession, considered that an educational standard was necessary for the profession. They got a new charter at that time, and the charter conferred the power of holding examinations. In 1887 they then decided that every associate should pass a series of examinations extending over three years. Out of the associates the fellows are elected, so that at the present moment, so far as membership of the Royal Institute of British Architects is concerned, the gate is closed. Nobody can become a member of the Society who has not passed the three consecutive examinations. The Institute has decided what they think an architect should know. There have been some criticisms. I got a letter this morning from

Professor Simpson, of Liverpool, saying that, in his opinion, the education should have been provided first, while entirely agreeing with the principle that education should precede examination. I don't think that is a fair view to take, because if the Institute had not decided what an architect should know, we would be now as we were thirty years ago. I think the complaint is that the State has not accepted what the profession has declared to be necessary, and provided the necessary education, instead of leaving it entirely to voluntary effort.

Where are the examinations held?—In London or in any part of the provinces where students present themselves. The Architectural Association of London is a junior body which exists almost for the purpose of mutual aid in education, and when the Institute started these examinations the Association commenced classes. These classes have been carried on altogether out of their own pocket. They are principally night classes, but this year they have launched out a little further and have established day classes. That is the curriculum of the Association, so that the Association voluntarily tries to do what it can to furnish young men with a system of education. There are in London, of course, other classes designed for architects. There is a course of architecture in University College, but it consists simply in the history of architecture and a course in building construction, which are very well so far as they go, but incomplete. There are courses in King's College; but I think I might sum up the general professional feeling towards these classes as this: that they are inadequate. Recently a school of architecture has been developed in the Liverpool University, I believe, by private effort altogether.

Is that the only University College in the United Kingdom that confers a degree in architecture?—That is the only University College where they have commenced to give this degree for the first time.

That is the degree of Victoria University, of which the Liverpool University College forms a branch?—Yes; it is only in Liverpool that this degree can be got, because that is the only one of the three colleges that has got an architectural school.

But no university degree is conferred in architecture except through the University College of Liverpool?—Yes. Here is a prospectus of the Liverpool College (*handing it in*)\*

The London University confers no degree in architecture. Is that so?—There is no degree in architecture.

But there is a course of training. Does the training in University College, London, form part of the curriculum for a diploma in engineering, or is it separate?—In King's College they give a "college certificate" in architecture and the associateship of the college (A.K.C.).

Professor Dickey: Does the new London University not give a degree?—No.

Is it not in contemplation?—It is, I believe, in contemplation; but the R.I.B.A. is not well satisfied with the position of affairs. The Gresham Commission proposed architecture as an independent faculty, but the result of the late formulating of the scheme has been to leave out "architecture" altogether from the various faculties, and it is supposed to be included either in the faculty of science or engineering.

Mr. Justice Madden: Your suggestion is that in a properly constituted university system there should be a separate faculty of architecture, with a corresponding degree, and a school and professors in which and by whom architecture should be taught?—Precisely; on the plan of the American Universities.

Are there separate degrees?—The degree is Bachelor of Science, and that is given for all the branches; but you can take it either in mining, engineering or architecture.

You can specialise?—Yes; at Massachusetts there are nearly 100 students in architecture at the present moment, where they pursue a four years' course. They have passed or given degrees to 176 since they opened in 1873, including half a dozen ladies.

Would your idea be that the students should matriculate in a university and pursue an arts course up to a certain point, and then specialise?—The course at Liverpool seems very nearly as it should be. A student must matriculate in the usual way. He must then take arts subjects, and at the same time take up some portion of the architectural course in the first year. The second and third years are devoted entirely to work in the architectural school.

Most Rev. Dr. Healy: But he specialises to some extent, even in the first year?—Yes. The Liverpool school is, I think, a little deficient in science, but, as Mr. Simpson says, you cannot do everything at once. Of course, the difficulty in an architect's training is this: so to adjust science and art that a student gets fairly trained in both. Afterwards he may specialise, and one may become more of a constructor and another more devoted to the artistic side of the work, but it is of great importance that these two faculties should be trained

together. The great object of the training should be to enable the student to understand the true relationship of science and art to architecture.

Mr. Justice Madden: Supposing that there were a separate school leading up to a degree, what do you suggest as to the course of training prescribed—what should it include?—It should include, in the first instance, a certain amount of general culture, the elements of an arts course. It should then include drawing, pure and simple; painting, modelling, and everything of that kind. It should include a special study of the history of architecture, because it is only by a review of the finest works that man has produced that the taste of the student can be formed and elevated. The subject of the history of architecture should not be approached from a purely archaeological point of view, but should also be treated so as to show how architecture developed. I believe that in that way what we are all seeking for at the present day, a new style, is more likely to arise than by mere copying. The science should be treated from the constructional point of view, and should be taught, of course, by a specialist.

Has your attention been called to the syllabus of the courses in the department of Architecture and Construction set forth by the University College of London?—Yes.

In a general way, does that agree with your views?—In a general way; but it is deficient in the necessity for an arts course.

Are there any other remarks that you wish to bring before us?—My chief point is to bring before you simply the needs of the profession. I think the examination system of the Institute shows that it is of importance to bring before the State and before the public the need of the profession in regard to education. It is all very well for the Institute to say what they require, but it is the duty of the State to work up to, and to supply what the profession requires.

Do any considerable number of fully-qualified architects under the Institute hold University degrees?—A very small proportion, for the simple reason that very few men can afford the time. If a man goes for an ordinary arts degree, that gives him enough to do for two or three years and postpones his studying for his profession.

But if the status of a degree qualifying as an architect acquired by studying in a university were given, I suppose you are of opinion that it would tend to elevate the profession greatly?—Certainly.

Because there would be an element of liberal education introduced outside the mere professional training?—Yes. There has been an effort made before Parliament two or three times during the last few years to get a system of registration for architects legalised. A certain number of men think that would be a panacea for all the ills of the profession; but other men are of quite an opposite opinion. If Parliament were to organise an arrangement of that sort every man who ever designed anything, however humble—a builder's clerk who had designed a labourer's cottage for a Board of Guardians—could demand to be registered as an architect under the Act of Parliament.

Is it called a diploma or a certificate what is given by the Institute?—It is only an admission to the Associateship.

Most Rev. Dr. Healy: And the Fellowships?—The Fellowships afterwards follow from the Associateship. A man must be an Associate for five years before being eligible for a Fellowship.

Mr. Justice Madden: What proportion of those who are employed as architects in Ireland have that qualification?—You mean being members of the Institute?

Yes.—In Ireland I should say there are very few. I really could not name one who has taken the Institute examination. There may be some in Dublin and Belfast.\*

There are no qualifications legally necessary to constitute an architect?—No.

It differs in that respect from other professions; but what is the usual educational qualification of an architect?—Well, it depends upon the individual's standard. With some men it is just their name on a brass plate. That is what we complain of.

Probably you would answer that, as the universities have not recognised it as a separate school it is very difficult to define what is the qualification of an architect?—That is so. There are no opportunities for young men to study architecture, except in Liverpool. I have sent my son to Liverpool within the last few months, simply on account of the facilities for study there. There are some men in London who go to King's College, or to the Association school. They get

\* "I have just received a list of the students who have passed their entrance examination for the R.I.B.A., December 1901:—R.I.B.A. Examinations—Preliminary—151 passed (including two Irish students from Cork); Intermediate—45 passed (including one student from Belfast); Final—35 passed (no record of an Irish student)." Arthur Hill, December 11, 1901.

\* Prospectus of Day Classes in Arts, Science and Law for the session 1901-2, in University College, Liverpool. University Press of Liverpool, 1901, page 154.

education there, but they get no qualification—no stamp of a degree from it.

Professor Dickey: Liverpool is the only place where they can get a degree?—The only place in the United Kingdom. The degree was only created last year.

Most Rev. Dr. Healy: How would you propose for Ireland that degrees should be given in architecture? Would it be the degree of Bachelor of Science?—That is as it may be. So long as some mark is given I would not care; but Bachelor of Science probably would be the best. There is a Bachelor of Science degree given in America.

You are aware that in the Royal University the first year's course is not special or professional in any way; it is a general arts programme. Would you be in favour of that for architects?—Certainly.

It would be time enough to specialise at the end of the first year?—Certainly. The point I wish to put is this. The education of the architect should begin from the University course. In a few years you would have a body of really educated architects, and the public would then discriminate.

Professor Lorrain Smith: You intend to lead the public to discriminate, and not to have legal restrictions?—I do not believe in legal restrictions, such as registration. That would be beginning from below, and every man who practises, no matter what his standing, would be legally qualified to rank as an architect.

What number of students would there be in the faculty—what number would you naturally expect?—I do not suppose I would expect from Cork more than a half dozen.

Dr. Starkie: How many are there at present?—In the engineering school there are about sixteen or eighteen at present.

Professor Lorrain Smith: That is one side of the engineering school. You would contemplate an all round faculty giving a degree in architecture?—Yes. Cork is a very small place; and my scheme is very much broader than for Cork.

There are a large number of architects in Ireland?—Yes; a good number of them are in Dublin. There must be a large number here.

Do you happen to know in what the Liverpool School of Architecture originated?—I think it was at the instance of some private person or body.

Was it the architects of Liverpool asked for it?—I don't know exactly how it sprang up.

Professor Dickey: There are two ways in which architecture might be provided for: by education in a university, or in a technological institution such as in Manchester. You prefer the university?—I prefer the university for two or three reasons. In the first place, a technical school does not aim at general culture, and in the next place the aim of a technical school is to give the artisan who has the use of his hands or his tools as much science as he can take. That is not at all the training for an architect. An architect need not be a craftsman. It is not necessary for an architect to be able to play billiards in order to design a billiard-room, but he must know the size of the table and the length of the cue. It is not necessary that he should be able to take the tool out of a plumber's hands and solder a joint; but he should know the theory of these things. I think the subject would be better approached in a university than in a technical school.

You think it should be associated with engineering?—Yes; engineering as taught in a university.

Would you practically make it part of the engineering faculty, and make every bachelor of engineering study architecture, and every architect acquaint himself with the principles of engineering?—Certainly; the two professions should be worked together and taught together up to a certain point; but time is a consideration in the subject, and you could not expect an architect to spend a great deal of his time studying the higher mathematics, perhaps more or less distasteful to his temperament, nor would you oblige an engineer to study painting and drawing until he got sick of the whole subject. There must be specialisation.

But the architect of the highest type would, in your opinion, be produced by the university?—Yes. University training should produce a man of general culture, a scientific attitude of mind, and with his artistic temperament developed. He should know so much about all subjects as to be able to control those under him. Take, for instance, these modern American buildings of steel. They require an amount of calculation that an architect need not necessarily do himself, but he should know enough about them to be able to control the man whom he employs to make them.

You have visited Belfast and Derry?—I have. In my opinion the whole country should be afforded facilities in this respect.

Are there some buildings in Belfast which show a lack of architectural science on the part of local architects?—I don't know about that; but in Liverpool recently I happened to see a building of most charming design, but all the mouldings in front were run without any regard to the stone joints. That

design was made by some young draughtsman, and handed to the builder to carry out in any way he liked. The real spirit of architecture is that design should be based on construction.

Mr. Justice Madden: I think Mr. Ruskin has expounded that doctrine with great beauty of language and clearness in his "Seven Lamps of Architecture"?—Yes.

Most Rev. Dr. Healy: Are we really to understand—I am particularly anxious to know, it for my own information—that we cannot ascertain for certain that we are dealing with a qualified architect?—No; there is no means of ascertaining that. Young men simply start as architects, with or without education.

## DUNDEE INSTITUTE OF ARCHITECTURE.

THE annual meeting of this Institute was held on the 16th ult. The annual reports were approved, and reference was made to the death of Mr. J. J. Henderson, who for twelve years had been honorary secretary of the Institute. The following officers were elected:—President, Mr. A. A. Symon, Arbroath; vice-president, Mr. P. H. Thoms; members of Council, Messrs. G. A. Pyott, Charles Ower, William Farquharson and W. G. Anderson; honorary secretary, Mr. David L. Allan; hon. treasurer, Mr. Charles G. Soutar; auditors, Messrs. B. C. Douglas and J. D. Mills. The prizes in the Institute competition were awarded as follows:—Sketch Book—Mr. Stewart Kaye. Measured Drawing—Mr. John M. Fairweather; hon. mention, Mr. David Milne. Water-Colour Drawing—Mr. Alan Robertson. Design for Marine Hotel—Mr. David Milne; hon. mention, Mr. David Smith. Design for Farmhouse—Mr. Stewart Kaye; hon. mention, Mr. A. G. C. Nicholson. Design for Boat-house—Mr. Arthur Wilson; hon. mention, Mr. A. S. Robertson. Design for Summer-house—Mr. William Simpson.

## THE HELLENIC SOCIETY.

THE annual meeting of the Society for the Promotion of Hellenic Studies was held on Tuesday in the rooms of the Society of Antiquaries, Burlington House, Sir Richard Jebb, M.P., in the chair.

The report of the Council was read by Mr. H. B. Walters, the acting hon. secretary. It stated that during the session the work of the Society had been carried forward in its several departments with energy and effect. Three general meetings had been held, and had been well attended. It had for some time past been felt that the rooms of the Royal Asiatic Society were hardly adequate. Fortunately, the Council had been able to come to an arrangement with the Society of Antiquaries whereby in future all general meetings would be held in their excellent rooms in Burlington House. The Council had again made a grant, this time of 100l., to the Cretan Exploration Fund. By the aid of this fund Mr. Evans last year carried further his remarkable excavations on the site of Knossos, while Mr. Hogarth made some interesting discoveries at Kato Zakro. The response to the appeal issued by the managers of this fund last autumn was, unfortunately, so inadequate that it was found necessary to confine its operations during the present season to the work at Knossos upon which Mr. Evans had again been successfully engaged, though it was doubtful whether the funds now available would suffice for the completion of the excavations. Meanwhile another very promising Mycenaean site, at Palaeokastro, near Sitia, in Eastern Crete, which Mr. Hogarth had hoped to excavate under the auspices of the Cretan Exploration Fund, had been undertaken by the British School at Athens. A British School had now been established at Rome on much the same lines as the school at Athens. Satisfactory progress had been made with the facsimile of the Codex Venetus of Aristophanes, which was announced in last year's report. The facsimile itself was practically complete. Another special publication, which was announced last year, that of the report on the very important excavations undertaken by the British School at Athens on the site of Phylakopi, in the island of Melos, had also made good progress. The statistics of work done in the library again showed considerable progress. The number of visits paid to the library was 343, compared with 236 in 1900-10, and 190 in 1899-1900. On the other hand, there was a reduction in the number of members using the library, which was 66, compared with 81 and 70. The Council had decided that the time has now come when it was expedient to print the library catalogue. The Overbeck tracts (about 700 in number) described in the last report had been arranged and bound, and would be entered in the forthcoming catalogue. The purchases of the year included "Corpus Inscriptionum Atticarum," Tischbein, "Hamilton Vases." Also six volumes, which were wanting or imperfect in the Society's set of the "Revue Archéologique." The *Notizie degli Scavi* had been added to the list of periodicals. The year 1901-2 has been a period

of steady extension and increased use of the photographic collection. As to the present financial position, ordinary receipts during the year were 1,022*l.*, against 1,037*l.* during the financial year 1900-1. The receipts from subscriptions, including arrears, amounted to 641*l.*, against 646*l.*, and receipts from libraries, and for the purchase of back volumes 185*l.*, against 179*l.* Life subscriptions amounting to 78*l.*, donations 3*l.*, and for lantern slides 19*l.* had also been received. The ordinary expenditure for the year amounts to 665*l.*, against 716*l.* Forty-nine new members had been elected during the year, while thirty-seven had been lost by death or resignation. The present total of subscribing members was 759, and of honorary members twenty-five, the names of Professors Federico Halbherr and Adolf Wilhelm having been added to the roll of honorary members. Six new libraries had joined the list of subscribers and five had stopped payment, making the number at the present time 143, or with the five public libraries 148. The present year, like most of its predecessors, might be described as a prosperous, if uneventful one for the Society.

The Chairman, in moving the adoption of the report, referred to the loss sustained in the death of Mr. Alfred Benn, Mr. W. J. Stillman, the Bishop of Durham (Dr. Westcott) and Mr. C. J. Monk, the son of Bishop Monk, the biographer of Bentley.

The motion was seconded by Mr. Bikelas and carried.

Mr. Arthur Evans then gave a short account of his excavations in Crete. There were, he said, four distinct lines of walls of the Palace of Minos, made necessary, it might be, by successive inundations. He described the various chambers and frescoes and the complicated system of underground communication. A considerable number of very interesting frescoes—of the same school as those of Melos and Phylakopi—were also discovered. Many bits of naturalistic foliage and *filices* were found, and *dissecta membra* of sculptures of last year's discovery were successfully pieced together. Specimens of marvellous beauty came to light of early Minoan pottery—seal impressions of a primitive style, some with cryptographic inscriptions; clay tablets with the linear scrip developed from a pictorial prototype, and not derived from the earlier types hitherto known. The economic history of these ancient days was to some extent disclosed by a series of accounts. The excavations allowed an approximate reconstruction of a Minoan street, some of the houses being, as we should say, of a surprisingly modern character and displaying a highly-advanced civic development. The height of the houses enabled one to realise the description of the island as "hundred-cities Crete" and pointed to a congested population. The statuary was remarkable, and bronze wire was used for hair. In the eastern part of the palace was found a shrine of the later Mycenaean age of Knossos whereon were two stucco horns with sockets between them for a handle and near them cylindrical terra-cotta images. One of the most interesting discoveries was a wall design of elaborate mazes illustrative of the ancient traditions. His thanks were due to Mr. Mackenzie and Mr. Fyfe in the labours of reconstructing the remains of this ancient site and civilisation. Unfortunately funds were greatly needed. The results of the work were strikingly shown by pictures on the screen.

Mr. Carr Bosanquet, director of the British School at Athens, described briefly the work of the school on the east of the island, and the result pointed to Palæokastro as the chief town of this part of the island.

Mr. Evans and Mr. Bosanquet were heartily thanked for their interesting contributions.

## TESSERÆ.

### Artists as Interpreters of Nature.

THE soft suffusion of the soul, the speechless breathing eloquence, the looks "commercing with the skies," the ever-shifting forms of an eternal principle, that which is seen but for a moment, but dwells in the heart always, and is only seized as it passes by strong and secret sympathy, must be taught by nature and genius, not by rules or study. It is suggested by feeling, not by laborious microscopic inspection; in seeking for it without we lose the harmonious clue to it within; and in aiming to grasp the substance we let the very spirit of art evaporate. In a word, the objects of fine art are not the objects of sight, but as these last, are the objects of taste and imagination—that is, as they appeal to the sense of beauty, of pleasure and of power in the human breast, and are explained by that finer sense, and revealed in their inner structure to the eye in return. Nature is also a language. Objects, like words, have a meaning, and the true artist is the interpreter of this language, which he can only do by knowing its application to a thousand other objects in a thousand other situations. Thus the eye is too blind a guide of itself to distinguish between the warm or cold tone of a deep-blue sky, but another sense acts as a monitor to it and does not err.

The colour of the leaves in autumn would be nothing without the feeling that accompanies it, but it is that feeling that stamps them on the canvas, faded, seared, blighted, shrinking from the winter's flaw, and makes the sight as true as touch. The more ethereal, evanescent, more refined and sublime part of art is the seeing nature through the medium of sentiment and passion, as each object is a symbol of the affections and a link in the chain of our endless being.

### Joseph Wilton, R.A.

Among those lucky artists who, with humble genius, moderate skill and ordinary prudence, acquire a name and a fortune equal or superior to men of higher talents and attainments, was Joseph Wilton, who was state coach carver to George III., and modelled the ornaments for the coronation state coach. He was born in London on July 16, 1722. His father, though a common plasterer, acquired a fair fortune by manufacturing ornaments for ceilings and for furniture, resembling those known in France by the name of *papier-maché*, and in his workshops in Hedge Lane, Charing Cross, and in Edward Street, Cavendish Square, he employed several hundreds of men and boys in this profitable manufacture. These premises were afterwards occupied by his more eminent son. Having shown early in life a strong inclination for sculpture, he was placed under Laurent Delvaux at Neville, in Brabant. Of the progress which he made under this foreign instructor we have no account. In his twenty-second year he proceeded to Paris—studied in the Academy under the direction of Pigalle, whom Voltaire patronised—gained the silver medal and made himself acquainted with the art of working in marble. In 1747 he removed to Rome, where he distinguished himself so much to the satisfaction of the Roman Academy, that in 1750 he was presented with what is called the Jubilee Gold Medal, given by Pope Benedict XIV.—and, what was more beneficial to his future fortunes, acquired the patronage of Mr. Locke of Norbury Park—a gentleman eminent for taste and no less so for generosity. Wilton was the first of our native sculptors who went through a regular course of academic study—the wealth of the family enabling him to gratify all his desires of instruction and of travel.

During his stay in Italy he executed many copies of the antique statues, and as they were in marble it is likely that he had assistants, for a fine copy of a work of art in such materials can be done by no one in a hurry. For these productions he found a ready market, chiefly amongst his travelling countrymen, and no doubt was willing to believe that what filled his pocket extended his reputation. It was the practice then to manufacture statues and paintings of all dimensions, but chiefly half or full size, from esteemed works, and sell them according to the generosity of customers. This has filled the world with multitudes of coarse imitations, which have nothing of their originals save the posture and dimension, and are deficient in all that distinguishes the works of genius from those of a machine. Having thus spent eight years in Italy, Wilton returned to London, accompanied by Cipriani the painter, Chambers the architect, and one Capizzoldi, a skilful modeller, a sculptor and also a painter, who was desirous of finding a fortune in England. This poor Italian wanderer took an attic in Warwick Street, purchased two real chairs and a table—having no more money to spend among the upholsterers—limned upon the naked walls the proper allowance of sofas and curtains, and in this humble abode entertained his friends on the equally humble fare of an oyster and a pint of porter. A far different abode awaited his friend Wilton. The Duke of Richmond at this period conceived an affection for sculpture, and resolved to give his country the advantage of his taste and enthusiasm. He formed a gallery in Spring Gardens, purchased thirty casts of antique groups and statues, opened the doors to the students of art, and promised premiums to the most meritorious. Of this gallery Wilton and Cipriani were chosen directors, and Romney was one of the students. Joseph Wilton was tall, portly and personable, a perfect gentleman in manners, a warm friend and an agreeable companion. He went always dressed in the extremity of fashion, with a gold-headed cane, and a bag-wig plentifully powdered. His bust by Roubiliac represents him with a sculptor's hammer in his hand; it was given by Lady Chambers to the Royal Academy. Of his system of study or habits as an artist, who would inquire as a matter of either improvement or curiosity? and how little could now be ascertained were the inquiry made? As a sculptor he has little original merit; with much of the mistempered fancy of Roubiliac he shows none of the Frenchman's poetry—he is never lofty and but seldom natural. There is generally a coldness of sentiment in his faces, and a want of dignity in his attitudes. His groups are mobs, his statues appear reeling and intoxicated. There is no gravity, no repose; all is on the stretch, till action becomes painful. In his chief monuments we look in vain for that melancholy grace and serenity so becoming in sepulchral sculpture. The whole seems tumbling like waves of the sea. All that can be said on the other side

is that Wilton exhibits occasional grace of thought and frequent skillfulness of execution, and that in his greater works there is a sort of picturesque splendour, which, in the opinion of the mob at least, will cover a multitude of sins.

### Representation and Deceptive Imitation.

Painting, like every other of the free arts, is an embodiment of the universal or ideal in the particular material element with which it has to deal. From hence it derives a special mode of representation, which consists not in merely imitating the actual, nor in imaginary reflections of the purely notional, but which impresses on the forms of natural objects a tone and character of something which the mind conceives of their essential and spiritual type—which is the true "beautiful" of art. Its proper expression, therefore, must be sought, as to its general tendency, in characters that awaken the spiritual as opposed to the animal perceptions; as to its executive part, it must substantially reproduce rather than mimic nature. The beauty which it embodies must raise the mind to pure conceptions, not allure it to earth by exciting the senses. In order to this it must never forget its peculiar function, which is to project on the illuminated sphere of art a virtual image of the material thing depicted—not to repeat a positive identity. Representation, therefore, in a certain heightened form, not deceptive imitation, is its province. In proportion as the one is kept in view, with regard to the symbolic bias of true art, will its productions, in design as in the smallest detail, tend upwards and towards perfection. With the first steps on the other side begins the downward way, leading to error and poverty in design, to extravagance or weakness in manual execution. The first was the way which the great masters, whether consciously or instinctively, followed; deviation into the second was the signal of decline in art—and it is to this day misleading too many of its actual professors.

### Greek Craftsmen.

Throughout the history of art in every age its greatest workmen have, with very few exceptions, not been highly educated, but, according to our modern standard, ignorant, uncultivated men. The special excellence by which each working man was individually known was art in workmanship; and thus in ancient Greece the very names of architects and artists indicate their artisan ability. The mythic centaur-artist Chiron was, in English, "Mr. Handy;" Cheirisophus, a carver of repute, was "clever-handed." Then there were Eucheir and Eupalamus, each "good-handed;" and the artist Chersiphron, the "handy-minded," was one of the master-workmen at the Ephesian temple of Artemis. These Greek names derived from handicraft are interesting in their difference from our own, which are all simple names, like Mason, Carpenter and Smith, Paynter and Wright, and in the second generation, like Benhadad, Mr. Smithson. There is no quality or excellence denoted; but in Greece the quality is most considered, not the trade.

### Roman Plastering.

The houses of the Roman or semi-Greeks (as those of Pompeii were) had the natural colour of the pavements altogether carried off and subdued by the most vivid artificial colours that can be imagined. The walls and columns were covered with the beautifully delicate white crystalline plaster which surpassed the very marble itself in absolute purity of whiteness. And this plaster was then marked out and divided into panels, and covered with delicate ornament in the most brilliant and powerful colours that have been ever used; colours used not as mere auxiliaries to heighten the general effect of a more quiet general tint, but in large broad masses, edged round with borders of tints deeper, but just as bold, and where the mansion or the room was of a more ornate class, set off with a border or a centre piece, which embodied the dreams of their elegant but licentious theology in forms of very loveliness. But all this was very superficial and fading—a damp wall, a piece of imperfect plaster, could wreck the finest fresco—and the ancients then brought to bear upon their wall decoration the same kind of work which they used more coarsely though effectively in their pavements.

### GENERAL.

The City of Leipzig has purchased for 7,500*l.* the monument of Beethoven, executed by the German sculptor, M. Max Klinge.

The French Government have purchased the following architectural drawings from the Salon:—Lavabo, attributed to Luca della Robbia, by M. Polart; an old window, by M. Ottin; the church at Triel, by M. Hannotin; and a fresco in the Manor of Challant, by M. Chauvet.

At a Meeting in London it was resolved unanimously "That it is desirable that a national memorial of the late Right Hon. Cecil Rhodes should be provided, and that an executive committee be appointed to collect the necessary funds and decide the form of the memorial, reporting hereafter to those summoned to this meeting."

The General Committee of the Wykehamist South African War Memorial, having adopted the recommendation of the executive committee that the memorial should take the form of a new entrance gate into the school grounds, in place of the one now existing by the racquet court, met on Tuesday to consider plans and designs for the gate submitted by various architects. It was resolved that, subject to the approval of the governing body, Mr. Frank L. Pearson should be instructed to carry out the memorial.

The Fortifications of Cologne are to be removed, and the ground occupied by the military zone will be sold to the city. The price to be paid is 98,000,000 marks.

Plans for the Brighton Electric Railway will be lodged in November, and which, it is to be hoped, will sustain examination, unlike those of last year.

Mr. Mathew Ridley Corbet, A.R.A., died of pneumonia on Wednesday in last week. He was lately elected an associate of the Academy. He was a pupil of Signor Costa, and in all his works the influence of Italy was perceptible. He was in his fifty-third year, but his powers were only recently admitted.

The Galerie des Machines, which formed part of the Paris Exposition, has been let for four months at a rent of 60,000 francs, for the purposes of organising an exhibition of aerostation.

The Trappists, who have settled near Kingsbridge, South Devon, have decided to spend the sum of 30,000*l.* in the erection of a monastery.

Ten Works of Sculpture have been purchased from the Salons for the decoration of buildings or open places in the outer districts of Paris.

The Military Museum in the Invalides, Paris, has been enriched by a collection of models in cardboard numbering 20,000, and representing all varieties of Napoleon's troops. The figures belonged to the late M. Würtz, an apothecary in Paris, and were all prepared in Alsace.

M. Karapanos has presented his valuable collection of antiquities, mainly consisting of objects found at Dodona, to the Greek nation. The collection will be preserved in a separate room at the Archæological Museum.

M. Camille Bernier, the French painter, has bequeathed to old and poor members of the Society of French Artists the sum of 20,000 francs.

The Degree of D.Litt. has been conferred by the University of Dublin upon Mr. George Abraham Grierson, Fellow of the University of Calcutta, chief of the Linguistic Survey of India; Dr. Theodore Reinach, and Mr. William Ridgeway, Disney Professor of Archæology at Cambridge.

Mr. G. W. Humphreys has been appointed manager of works by the London County Council at a salary of 1,200*l.* a year.

A Soldiers' Monument in honour of twenty Nova Scotian soldiers who fell in the South African war was unveiled in Halifax last week. The statue, which is placed on a high pedestal, is a figure of a khaki-clad Canadian soldier, and cost 2,000*l.*

Portions of the old Roman road to the North have been uncovered during some excavations at Chester-le-Street, Durham. The track was met with a yard below the present surface.

M. Forain has been commissioned to paint a panel to be placed in the buvette of the Paris Municipal Council in the Hôtel de Ville. A sum of 10,000 francs has been voted for that purpose.

The London County Council have instructed the special committee on new offices to bring up a report at the earliest possible date as to a site for a county hall.

Mr. Thornycroft, R.A., submitted to the committee the sketch-model of the statue of Bishop Creighton for St. Paul's Cathedral. The bishop is in his cope, with his pastoral staff in his left hand, and in the act of giving the blessing. It is to be placed in the choir aisle, between the carved surfaces of the oak screens. On the advice of the sculptor, supported by letters from Mrs. Creighton and the surveyor of St. Paul's Cathedral (Mr. Somers Clarke), the statue will be erected in bronze instead of Carrara marble, as originally intended. Mr. Thornycroft proposes to add a bronze background and affix to the pedestal two panels representing History and Theology. The statue will be finished by about October, 1903.

THE

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications*

## TENDERS, ETC.

*\*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**AYLESBURY.**—July 19.—Designs and estimates are invited for supplying and erecting a stone monument, 50 feet high, on Coombe Hill, near Aylesbury. Mr. R. J. Thomas, county surveyor, County Hall, Aylesbury.

**BERMONDSEY.**—Sept. 16.—Designs are invited for artisans dwellings to be erected on land at Rotherhithe, within the borough of Bermondsey, and known as the Fulford Street area. Premiums of 100*l.*, 60*l.* and 40*l.* will be awarded. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**CLACTON-ON-SEA.**—July 26.—Plans are invited for erection of a new school in Holland Road, Great Clacton, for 500 children, showing enlargement for an extra 300 children. Mr. Charles E. White, clerk, Wellesley Road, Clacton-on-Sea.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford S.E.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**SOUTHEND.**—Sept. 7.—Designs are invited for a church to accommodate 500 persons, a clergy-house, and a parochial hall or parish-room about 50 feet by 30 feet. Mr. C. H. J. Talmage, Kathleen Villa, Southchurch Road, Southend-on-Sea.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**TOTTENHAM.**—July 15.—Designs are invited for municipal buildings, fire station, public baths, &c. Premiums of 200*l.*, 100*l.* and 50*l.* are offered for the three best designs in order of merit. Mr. W. H. Prescott, surveyor to the Council, Tottenham.

WALES.—July 24.—For erection of a boiler and engine house at the Joint Counties asylum, Carmarthen. Particulars on application to the Clerk to the Asylum.

WIBSEY.—For erection of four houses at Wibsey, near Bradford, Yorks. Mr. David W. Weatherhead, architect, Low Street, Keighley.

WROUGHTON.—July 8.—For completion of eleven houses in Winifred Terrace, Swindon Road, Wroughton. Mr. W. A. H. Masters, architect, 38 Regent Circus, Swindon.

YORK.—July 16.—For erection of the proposed general offices at York, for the North-Eastern Railway Company. Mr. William Bell, company's architect, York.

THE Shipley District Council have instructed their engineer, Mr. Malcolm Paterson, M.Inst.C.E., of Bradford, to prepare the necessary plans and sections for the extension of their bacterial beds in accordance with the requirement of the Local Government Board. It may be remembered that after receiving the sanction of the Local Government Board in 1896 for the tank precipitation and land filtration scheme, designed by Mr. Paterson, the Shipley Council decided to carry out a bacterial scheme without awaiting further sanction, and it now appears that the scheme carried out is not deemed sufficient by the Local Government Board. The additional works required will include  $1\frac{1}{4}$  acres of bacterial beds and an extension of the land filtration area.

## BECKENHAM NEW SCHOOL AND INSTITUTE.

THE Bishop of Ripon formally opened on the 24th ult. the commodious block of buildings which have been presented by an anonymous donor to Christ Church, Beckenham, and are designed to afford the much needed accommodation required for the Sunday school. There is also a large hall suitable for meetings and parochial gatherings, whilst the Young Men's Institute will be provided with an excellent meeting-place. The new buildings comprise a school hall 58 feet long with the platform at the south end and a gallery at the north end, in which is a small but beautifully-toned organ. On either side of the hall are five bays for classes, which can be separated by curtains. Immediately adjoining the west porch is the superintendent's room, and at the back of the hall is a kitchen, with cooking appliances for use when refreshments are to be provided. At the south end towards the church are two classrooms for senior scholars, each having a porch, lavatory and independent approach from the road. Storage space is provided below the platform and classrooms for furniture, &c, not in use. The front railing of the platform is made easily removable for lantern lectures, concerts, &c. The site being upon a hill the institute room for young men, which is between the new hall and the old buildings, is approached down a few steps and is 37 feet long, with a fireplace at one end. This room has an independent entrance from the road, and in addition to lavatory accommodation there is a cycle shed for the use of members. The institute communicates by a lobby with the old building, which is newly fitted for use as a gymnasium on week-days and infant school on Sundays. The new buildings have been devised so as to avoid any interference with the light and ventilation of the old school buildings and the obstruction of the view of the church from High Street. The general contract has been carried out by Messrs. Higgs & Hill, of Crown Works, Lambeth. The architect was Mr. Francis Hooper, F.R.I.B.A., of 12 Norfolk Street, Strand, and Beckenham.

MR. HILEY, deputy town clerk of Birmingham, has been appointed town clerk of Leicester at a salary of 1,000*l.* per annum. Mr. Hiley thus succeeds Mr. Bell, who has been appointed town clerk to the City of London, and who formerly held a similar appointment in Birmingham.

# WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

**ELECTRIC NOTES.**

THE navvies employed at the laying of the cables for the electric lighting of Airdrie have struck work for an increase of wages. The strikers number about 200.

At the meeting of the Stourbridge Council the electric powers and gas committees recommended, and it was decided, that the electric-lighting order which the Council had obtained should be retained by the authority, and that powers to carry out the order be transferred to the gas committee.

THE May-Oatway electric fire-alarm, to whose valuable attributes we have on several occasions referred, and of which Sir Eyre Massey has expressed his approval, has been installed at the Poplar workhouse, where on Wednesday afternoon before a number of architects, surveyors and other invited guests, a full demonstration of its remarkable rapidity of action was given to the satisfaction of all present.

THE accounts of the first fifteen months' working of the Stepney electric light undertaking have been published. They show that up to the end of the date under review the loan capital invested in the works was 109,000*l.* On the fifteen months' working there was a loss of 2,743*l.*, while a balance from the next year's working of 2,034*l.* is available towards the extinction of this loss. In the meantime the consumption of the municipal electricity is growing at the rate of 400,000 units per annum, and this, with the extension of the light to Mile End, gives every hope that in a short time the works will be returning a handsome profit to the ratepayers on their investment.

WORKING the points of the crossings is still one of the difficulties on electric tram lines. At Leeds, says the *Leeds Mercury*, pointsmen cost the Corporation about 2,000*l.* a year. To stop this waste a Leeds firm have devised an apparatus that can be worked from a car by either conductor or driver or by both. All that the driver or conductor has to do is to pull one of two strings, according to the direction in which it is desired to travel. The junction frog is so arranged that if the car gets on to the wrong metals it can be run backwards to rectify the error. Even if nothing be done to direct it by conductor or driver the car will keep the metals, and anything like an accident appears out of the question. An ingenious arrangement connected with the same apparatus effects the lighting of the car.

IN connection with the postponement of the Coronation illuminations, in many cases instructions have been received

by the E.L.B. Company to keep the illuminations in position, with the hope that they may be utilised on the recovery of the King. Amongst large public buildings equipped on the E.L.B. system where this has been the case is the Stock Exchange, and the lighting on the Company's system at Westminster Hall of course remains untouched until further notice. It is noteworthy that while the English company was busily engaged with Coronation requirements on this side of the water, the French company was attending to the equipment of several of the visitors to our Naval Review, as, for instance, the French cruiser *Montcalm* and Baron Rothschild's splendid yacht. The French company is now busily occupied with preparations for the Government and Municipal celebrations for July 14, having only recently completed the arrangements for the great fête at Neuilly.

THE first annual report of the West Bromwich electrical undertaking for the year ended March 31, 1902, was issued on Saturday. This states that the supply commenced on May 24, 1901, and up to March 31, 1902, there were 62,894 units measured by the consumers' meters. The total kilowatts installed was 250, exactly the present capacity of the generating plant. With the exception of a little trouble at the beginning, the engines and dynamos had run perfectly since the supply commenced. The maximum load on the station occurred on December 20, 1901, and amounted to 122 kilowatts, equal to 83 per cent. of the total number of lamps. The total cost per unit sold in the ten months' working was 4*48d.* This compares very favourably with the total costs of other stations. The total length of mains laid to date was—feeder, nearly 6 miles, distributor 4½ miles, pilot 2½ miles. The whole of this cable, except the pilot, had stood a pressure test since being laid of 2,000 volts between conductors for one hour. This voltage is eight times the working pressure of the cable. The total number of consumers wired by the department was fifty, representing 3,208 eight candle-power lamps, or 66 per cent. of the total number of lamps connected, and an outlay of 1,650*l.* On the ten months' working there was a deficiency of 1,403*l.*

AT the meeting of the Chichester City Council on Friday the electric-lighting committee reported that the County of Sussex Electrical Power Distribution Company (who have laid down plant at Lewes) were prepared to offer terms for the transfer to them of the Corporation's electric-lighting order; and as the committee were of opinion that the terms were as reasonable as could be got from any company, they

Buildings, Ludgate Circus, London.

recommended the Corporation to take such steps as might be necessary, and to transfer the order to the company subject to a satisfactory agreement. The terms included the following:—The company to repay the Corporation the costs incurred by the Corporation in obtaining the order; the Corporation to have the right of purchasing the works from the company by valuation as a going concern at the end of fourteen or twenty-one, or subsequent years in the usual way; as regards public lighting the Corporation were not bound to be customers of the company, but the latter would be prepared to supply energy by meter for public lighting and for all Corporation buildings and public places at the rate of 3d. per unit, or the following fixed rates:—For arc lamps burning up to 11.0 P.M., 15s. each per annum, if fitted with two incandescent lamps to burn from 11.0 P.M. till dawn, an additional 2s. per annum; for incandescent lamps each fitted with two 8 candle-power lights, and lit from sunset to dawn, 6s. per lamp per annum; with regard to the cost of light to private customers the company would adopt the Brighton system of charging, i.e. the charge would be 2½d. per unit for all current used by a consumer over and above a certain quantity in each quarter. Alderman Smith, in moving the confirmation of the committee's report, said as it was not considered desirable for the Corporation to carry out its own scheme for electric lighting the city, the next best thing would be to transfer the order on the most favourable terms, and he did not think it would be possible to obtain better terms than those mentioned above. The motion was seconded, and the Council confirmed the committee's report.

### TRADE NOTE.

THE Cherry Tree Machine Co., Ltd., engineers and iron-founders, Cherry Tree, near Blackburn, have secured the under-mentioned contracts:—For the supply of laundry machinery to the isolation hospital, Pontardawe, and the supply of a drying closet to the St. Andrew's Brine Baths, Droitwich, Worcestershire.

THE Ashwell Rural District Council have resolved to have water and drainage schemes prepared for the parish of Ashwell, Herts, and Mr. J. R. Elliott, A.M.I.C.E., of Nottingham, has been instructed to prepare the necessary plans.

### BUILDING AND BUILDERS.

THE premises of Messrs. Clegg Bros., joiners and builders, off Yorkshire Street, Burnley, caught fire on Sunday night. The roof soon fell in. The damage is estimated at about 1,500l., and is only partly insured.

At the meeting of Glasgow Trades Council last week the bricklayers' delegate reported that the employers had, in response to representations from the men, agreed to raise the wages ¼d. an hour. This is the amount of the reduction which was made about a year ago.

FREDERICK MILWARD, builder, of Whitchurch, Cardiff, who should have appeared at Llandaff police court on Monday, on a charge of having appropriated a quantity of building material belonging to another builder, committed suicide late on Saturday night by hanging himself in Cardiff Goal, where he was incarcerated on remand. When the case was called at the police court on Monday a letter was received from the governor of the gaol intimating that the prisoner had taken his life.

A SERIOUS scaffold accident occurred at Wood Green on Wednesday afternoon. Several workmen were attending to the roof of St. Michael's Church, which is in course of erection, when the scaffold collapsed. The men fell a distance of about 40 feet, and one of them, named Brooks, living at New Southgate, had several ribs broken and sustained some internal injuries. He was removed to hospital, where he lies in a critical condition. The others escaped with a severe shaking.

At a standing joint committee of the County Council of Linlithgow, Colonel Hope submitted a report with relative plans of new cells and constables' accommodation at Bathgate police station. After careful consideration it was agreed to carry out the work as suggested, and it was remitted to the chairman and Captain Steuart to get in offers for the work and to have it proceeded with as soon as possible. It is expected that the work will cost about 1,200l. The additional accommodation will embrace three cells and quarters for married sergeant and accommodation for the constables of Bathgate.

At the last meeting of the Burley-in-Wharfedale Union District Council the engineer for the new waterworks, Mr. M. Paterson, of Bradford, reported that the dam was within 9 feet of top-water level, and that 40,000 cubic yards of earthwork had been completed, leaving less than 10,000 cubic yards to be done. Of this probably more than nine-tenths had come out of the

reservoir site within water-line, in addition to most of the puddle, the rubble pitching and the beaching. The pitching is almost entirely obtained from surface drift boulders of mill-stone grit, naturally the hardest and most durable specimens of that stone. These were split into massive blocks and keyed up with smaller material. It is expected that the whole of the earthwork and puddle will be completed by the end of October, and the works by the end of the year.

### VARIETIES.

MR. ALFRED FIDLER, A.M.I.C.E., has been appointed engineer and surveyor to the Northampton Borough Council.

OVER 200,000*l.* has been received at the Mansion House towards the National Memorial to the late Queen Victoria. The Federated Malay States have sent 5,000*l.* to the fund through the Colonial Office.

HARTLEPOOL is at length in possession of a commodious town hall, the Corporation having purchased the building in Lumley Square known as the Temperance Hall, which has been altered, and is now admirably adapted to its new uses.

MR. JOHN HALLIDAY, late town clerk of Stewarton, N.B., died on the 23rd ult. Mr. Halliday, who was town clerk for upwards of forty years, retired a year or two ago on account of his failing health. He was in his eighty-first year, and is survived by a grown-up family.

THE University College Hospital committee have appointed Mr. George Hornblower, F.R.I.B.A., of No. 2 Devonshire Terrace, Portland Place, W., architect to the hospital, in succession to the late Mr. Henry D. Shepard, who received the appointment upon the resignation of the late Sir A. W. Blomfield, A.R.A.

WE have received from Messrs. Dawbarn & Ward, Ltd., 6 Farringdon Avenue, E.C., a copy of "Outdoor Carpentry," by S. Walter Newcombe, which is No. 1 of a country house series of practical handbooks. The book is carefully written and amateurs should find it of great utility. The series will deal with such subjects as planning a garden and grounds (No. 2 ready in about ten days), water-supply, sanitation, &c.

IT is proposed to restore the ancient keep in York Castle known as Clifford's Tower. Negotiations have been pending for some months between the Yorkshire county committee and the Home Office, and now the Government have made a grant

of 3,500*l.* towards the object. It is intended to make an almost immediate commencement with the work, which will consist of underpinning the tower and restoring the leaning sides to the equilibrium. The work, though not extensive, will be costly, it being intended that it shall be of a thoroughly substantial character.

MR. ANDREW CARNEGIE has offered to give 12,000*l.* for the purpose of providing a new central free library for Leicester, on condition that a site is provided and provision made for adequate maintenance out of the rates. Mr. Carnegie has also offered 15,000*l.* for the erection of two free public library buildings in Paddington, conditionally that the borough council supply the sites and agree to levy the maximum penny rate; and 2,500*l.* for a free public library building for the town of Larnie, provided the Urban Council undertake to collect or otherwise guarantee an endowment fund of 125*l.* per annum.

THE sixth annual exhibition of students' work at the London County Council Central School of Arts and Crafts in Regent Street is open to the public, free, between 10 A.M. and 8 P.M. from July 1 to July 5 inclusive. The work of the students comprises bookbinding, stained glass, silversmiths' work, enamelling, writing and illumination, carving and gilding, cabinetwork and wood-inlaying, architectural design, furniture design, drawing, modelling, &c. Seven hundred individual students have been in attendance during the session, the greater number being journeymen or apprentices engaged in artistic crafts. Saturday morning classes will be arranged next session for apprentices in the various branches of the silversmith's trade.

FOR the winter season 1902-3 it has been determined by the Glasgow museum and galleries committee, with the approval of the Corporation, to bring together a collection of artwork in metal. The exhibition section will embrace works, both ancient and recent, in gold and silver, brass, bronze, steel and iron, pewter and other mixed metals, with illustrations of such ornamental processes as damascening, chasing, engraving and enamelling on metals. In the competition division awards will be made under the following heads:—(1) Repoussé ornamentation on silver, copper, brass, or other metal. The objects sent in competition may be in the form of panels, plaques, salvers, vases, cups, cases, covers, sconces, &c. (2) Engraving and chasing, separately or combined, applied to vessels and domestic articles executed in gold, silver, brass, steel, or other metal. (3) Ornamental wrought-iron in the form of gates, grilles, panels, brackets, lamps, or other useful domestic articles.

The exhibition will be held in the Glasgow Green Branch Museum (People's Palace). It will be opened about December 19 next, and will continue for a period of not less than three months. Loans will be received and exhibited free of cost to contributors.

ON Saturday afternoon the old Market Cross of Culross, which has been restored and re-erected by Sir James Sivewright, of Tulliallan Castle, was formally unveiled. The old steps, which are said to date back to 1588, the year in which the town was erected into a royal burgh, have been renovated and prepared for the new cross. The new shaft is tapered from 15 inches square at base to 13½ inches at top, and has a large splay off its four corners, and is in one stone 10 feet long let into old base and fixed with a copper dowel, 18 inches by 1 inch. The panelled top is in one stone, 25 inches high, with pilasters at angles, and carved on the four faces as follows:—Front face, arms of Culross; second face, arms of Sir James Sivewright; third face, cypher of King James IV.; fourth face, inscription of donor. The cornice is of one stone, with four curved pediments and seat for unicorn, and the pediments carved in each tympanum as follows:—First, date of creation of burgh, 1588; second, initials of Sir James Sivewright; third, date of restoration, 1902; fourth, initials of Provost Cunninghame. The apex has a unicorn sitting on its haunches, and holding in front of it the collar of the Order of the Thistle and the Royal shield bearing the arms of Scotland. The restoration was carried out under the supervision of Mr. J. W. Small, a well known authority on Scottish market crosses.

THE arrangements of the British Fire-Prevention Committee for July include a test with materials by the British Uralite Company on July 9. Further, a test with the Pearson automatic fire-alarm system and a test with glazing by the Union Plate Glass Company. The issue of publications during July will comprise Publications No. 71, dealing with a floor constructed of Jarrah timber, and Publication No. 72 dealing with a roof test with ordinary slate roofing and a roof covered with vulcanite. In respect to the committee's position regarding the inquest being held on the Queen Victoria Street fire, this investigation is being attended by the committee's counsel, Mr. Allison Russell, under instructions from Messrs. Williamson, Hill & Co. At the opening of the second sitting, Mr. Russell took the opportunity to make the statement that the interests of the committee in this inquest were strictly limited to questions of fire prevention, *i.e.* to matters relating to the planning, construction and equipment of the premises

involved, and that the committee did not intend to deal with the Fire Brigade aspect of this calamity, or to participate in the attack upon the Fire Brigade or individuals. In respect to the recent formation of the new Industrial Section, Alderman Sir W. P. Treloar, J.P., has accepted the first vice-chairmanship.

A NEW workhouse infirmary, erected by the Cheadle Board of Guardians to take the place of the old infirmary, which has become insufficient for the requirements of the union, was opened on the 20th inst. in the presence of a large attendance. The site is on land adjacent to the workhouse, which already belonged to the Guardians, so that no expenditure has been necessary under this head. The total cost, including laundry and machinery, amounts to about 10,000/. The design of the building is of a plain, domestic architectural character, with walls of brick, stone dressings to the windows, and tiled roofs. The basement is raised about 7 feet above the surface of the ground for the prevention of damp. The infirmary is designed for fifty-four beds, and is divided equally for the accommodation of males and females. There is a central block containing entrance, two separation wards, surgery and waiting-room, with nurses' duty-room, scullery and larder. In each side block on the ground floor there are two wards with three beds each. On the upper floor in the central block are two children's wards with three beds each. There are glazed alcoves for convalescents and nurses' duty rooms again here. On the upper floor are four nurses' rooms, sitting-room and bathroom. On the first floor of the side block there is one large ward to hold sixteen beds. The heating is by central stoves, with down-cast flues; these have been supplied by Messrs. Shorland Bros., of Manchester. There are airing yards at the back for patients, and the front grounds, about three-quarters of an acre in extent, will be laid out as gardens and recreation-grounds. The building is fireproof throughout, and in addition to the internal staircase there are two external fire escape stairs. The new buildings include a laundry, with receiving room for linen, sleeping-room, hydro-extractor, boiling and rinsing-troughs, steam mangle, &c. The drainage has been carried out on the most modern principles, and that of the old house has been remodelled and joined up to it. The new building is connected with the present kitchens of the old workhouse by means of a covered way. The contractor's work has been carried out by Mr. Gallimore, of Newcastle, from the designs of Messrs. Chapman & Snape, of Newcastle.

**WOLVERHAMPTON EXHIBITION.**

THE main entrance to the exhibition comprises a set of hammered wrought-iron ornamental gates as shown in illustration, including centre pair, 14 feet wide and 8 feet high, and two side gates each 5 feet wide, all hung to 15-inch square cast-

iron pillars to match. The centre gates are surmounted by a fine elliptical arch, carrying three arc lamps, and bearing the name of the exhibition set in finely hammered art metalwork, the whole being judiciously treated with gold leaf. On either side of the entrance are curved wing pieces of massive railing forming a bay for the gates.

Published EVERY FRIDAY by GILBERT WOOD & LTD., at the Offices, 6-11 Imperial Buildings, Ludgate Circus, London, E.C.

Two other pairs of gates of similar design and construction are fixed to other entrances.  
In front of the fine machinery hall building, with its centre

ornamental statue of "Industry" over the main doors, are fixed on either side, to give balance and relief to the architectural detail and extent of wall surface, two well-made and very artistic wrought-iron electric lamp brackets, each carrying a lantern head containing seven fifty candle-power lights. These are fine specimens of the smith's craft, each measuring about 23 feet high, relieved with copper and hammered iron shields, the latter bearing the name of the manufacturers. These brackets, with the main entrance-gates and railings and all other gates and railings bounding the exhibition grounds, were manufactured and erected by Messrs. Bayliss, Jones & Bayliss, Ltd., of Victoria Works, Wolverhampton, and Cannon Street, London. We are informed that the whole of this ironwork will be for sale at the close of the exhibition.

#### NEW APE HOUSE AT THE ZOOLOGICAL GARDENS.

A NEW, attractive and commodious dwelling for the anthropoid apes has been erected in the popular gardens at Regent's Park.

This new building, which is quadrangular on plan, each side measuring about 85 feet, occupies a commanding position which it may be said to adorn. It is substantially built and cost about 7,000*l.* It possesses a new feature, and this consists in the complete separation of the part appropriated to the visitors from that in which the animals are confined, by means of a glass screen, which may be compared to a series of shop windows, set end to end without any intervening wall. By this means it will be fairly easy to keep the inmates in a higher temperature than obtains in the part allotted to the spectators, and to prevent their being fed or in any other way harmed by external influences. The apes can be well seen in their new quarters, but the public will miss their cries, for the glass screen shuts out all sound. Immediately within the glass screen run the warming-pipes of the hot-water apparatus, with several up-draughts by which cool fresh air from the outside can be admitted. There are four large cages, each forming a cube, of which the sides are 16 feet. The material is white enamelled brick, with granolithic floors filled in with cement, so that the whole can be easily and thoroughly cleansed.

## CHARLTON WHITE (ZINC) OIL PAINT

NON-POISONOUS. CHEAPER THAN WHITE LEAD.

THE SILICATE PAINT CO., J. B. ORR & CO., Ltd., CHARLTON, LONDON, S.E.

The cages are light and airy, but stout enough to hold any anthropoid likely to come into the possession of the Society. They are fitted with barrels for sleeping-places, and stout tree-trunks and swings offer ample opportunity for exercise. A door at each end of the block of cages admits the keepers to the back, where all cleaning and feeding operations are carried on, and between the back of the cages and the hinder wall, near the gull-pond, is a passage for this necessary service, and with doors for shifting the animals or introducing others. The partitions between the cages are furnished with sliding doors, so that the general arrangement may be compared to that of the dens in the lion-house, where all the arrivals are introduced to their new quarters from the back. The house is lighted from above and from the back. The apartments under the house devoted to the animals are large and airy. Some will be occupied as day-rooms by the keeper, others as stores, and one as a hospital, in which sick apes may be kept in small cages, subject to dry or moist heat, as may be thought desirable. The glass screen between the animals and the visitors is quite a new experiment in this country; but according to a recent report of the Council of the Zoological Society, "it has lately been adopted in several ape-houses built in Holland and Germany."

### THE ARCHITECTURAL DEPARTMENT OF THE LONDON COUNTY COUNCIL.

MR. W. WOODWARD has published the following remarks:—Building operations in London have during the last twenty years assumed a magnitude and an importance which have brought them within the category of matters of public interest, and it is a subject of moment to those concerned, and embarking in the business, to see that, whilst the safety and beauty of the Metropolis are properly cared for, no unnecessary obstacle to enterprise is placed in the way, nor avoidable cost imposed by the constituted authorities.

London is governed by several Acts of Parliament, but the two which most concern the building public are the London Building Act of 1894 and the Factory and Workshop Act of 1901, the latter having been prominently brought before the public in connection with the lamentable fire in Queen Victoria Street. Under the latter Act the London County Council furnishes a schedule of its requirements to facilitate escape in case of fire, and from my personal experience

in several cases I assert that whilst the officials are as earnest and as courteous as could be desired, they are quite inexperienced as practical men, with the necessary result that a series of official fads are promulgated which, whilst not securing the object all have in view, entail upon building owners unnecessary cost and delay, secure a mutilation of their premises which most seriously interferes with their profitable occupation and materially reduces their letting value.

The London Building Act of 1894 was hurried through in such a manner that the meaning of many of its provisions is the constant source of doubt amongst lawyers, architects, district surveyors and the London County Council officials. That being so, it is obvious that the administration of that Act should be in the hands of well-experienced practical men, as far as possible removed from bureaucratic notions and from an abnormal love of red tape; but, judging from my own experience, based upon constant mixing with practical building matters during the last thirty-five years, I assert that the architects' department of the London County Council is administered by courteous, well-meaning officials, possessed of very limited experience in actual building operations. The want of real practical knowledge has resulted in requirements which would be amusing if they were not so costly as regards money and time to architects and clients and unnecessary loss to ratepayers. And what does this mean to the public and to the London County Council itself? It means utter contempt for the London County Council by experienced practical architects and a desire on their part to do all they possibly can to avoid going to Spring Gardens at all. It means that they advise their clients to sacrifice all they possibly can to render unnecessary any application whatever to the London County Council. When an architect submits, on behalf of a client, drawings for some constructional work (I am not now alluding to the Factory Act) the duty cast upon the architect's department is to see that all legal requirements are complied with but not to employ, at the expense of the ratepayers, a staff of assistants to make minute calculations of the strength of steel work, &c., when that has already been done by better-qualified men, at the expense of the client, who would be responsible for the making good of future defects should they arise. It is quite obvious that if the London County Council proceeds upon the lines now adopted it will become the bureau for the supply of architectural designs to the public, free of direct charge, and insure forms of construction and strength of materials which will certainly last till the crack of doom.

## DUBLIN MAIN DRAINAGE.

A SPECIAL meeting of the improvements committee has been held to consider the report of the deputation that visited Sir Benjamin Baker, in London, on the 20th inst., with reference to the alleged defects in the deodorisation tanks at the harbour mouth.

The Lord Mayor submitted the following report :—

Gentlemen,—Your deputation, consisting of the Lord Mayor, Councillor Jones, Mr. Chatterton, Mr. Harty and Mr. Hellins, waited on Sir Benjamin Baker on the 20th inst., and laid before him a carefully prepared scheme for dealing with the permanent stability of the main drainage outworks as follows :—

To increase the thickness of the tank floors from a minimum of 12 inches to a uniform thickness of 3 feet 3 inches all over.

Sir Benjamin Baker was asked whether he considered this proposal would effectually provide the permanent stability referred to under the altered conditions which have been found to prevail during the construction of the works.

Sir Benjamin said he was quite satisfied that the proposal was sound and would be effectual, and that he did not consider that a Corporation dealing with public funds could afford to adopt a less costly expedient, although he had no hesitation in stating that if it were a private scheme of his own he would incur the risk, and consider the cost unnecessary. In the case of a public body he thought no risk should be incurred.

The proposals contained in Sir Benjamin's report of the 13th inst. were considered in full again, and were so far modified in favour of the scheme above referred to, and which is based on his views and recommendations.

Sir Benjamin expressed his views that none of the work already done was unnecessary, and further, that all the works executed were of vital importance to the security of the scheme; he also said that had it been possible to have foreseen when the works were designed the conditions we now know to exist, the additional works now recommended must have been included in the original design.

The probable additional expenditure will amount to 17,000l., based on the schedule or contract rates.

Your committee, accompanied by Messrs. Chatterton and Harty, subsequently interviewed Sir Weetman Pearson, the contractor, and discussed the question of the best class of concrete for these works, having special regard to weight and cost. They stipulated that the concrete should not be of a less

weight than that at present in use on the works, and Sir Weetman was informed that a formal order would be given him to execute the additional works in due course.

(Signed) T. C. HARRINGTON, Lord Mayor.  
RICHARD JONES.

The report having been adopted without opposition, the proceedings terminated.

## PORTLAND CEMENT.\*

(Conclusion.)

THE chemical action which takes place in the kiln appears to be as follows. I quote from a paper read by Mr. A. E. Carey, C.E., before the Institute of Civil Engineers, in April, 1892 :—"Chemically, the first effect in burning is to expel the  $\text{CO}_2$  from the  $\text{CaCO}_3$  producing oxide of calcium or caustic lime. This change takes place at 440 degs. C. (824 degs. F.), and the silica and alumina gradually unite to form silicate of lime till a temperature of 700 degs. C. (1,292 degs. F.) is reached, when the alumina comes into action, uniting with the silicate of lime to form a body of complex constitution. The temperature rises to about 1,600 degs. C. (2,912 degs. F.), but this degree of heat should be kept up for a short time only, otherwise a glassy comparatively inert body is formed. The iron, which in contact with the lime fuses at a lower temperature than the other bodies in combination, forms a film upon the clinker of a bluish black colour, and the greenish bloom on a well-burnt clinker is attributed by Dr. Michaelis to the trace of manganese." Any under-burnt portions must be carefully removed when the clinker is drawn from the kiln. Finally, the clinker, which is an inert mass, must be ground so fine that its active setting and hardening properties will fully develop upon the addition of water. It was supposed at one time that only the finer particles of cement (the impalpable powder) were active, and that the coarser particles were inert. Experiments

made a year or two ago by Mr. Butler go to disprove this, and to show that these coarse particles develop a certain tensile strength at later dates, say, from six to twelve months. Although this may, to some extent, be the case, it is certain that these coarser particles must always remain to a large extent inert, hence the necessity for further reduction to increase their utility.

Nearly all cements when freshly made contain a small quantity of uncombined lime, *i.e.* calcium oxide. This lime, if allowed to remain in its active state, would expand upon addition of water, and might thereby cause disturbance of the work in which the cement containing it was used. One object of warehousing is therefore to, what is termed, "mature" the cement, *i.e.* hydrate and possibly thereafter recarbonate by absorption of moisture and  $\text{CO}_2$  from the air any particles of uncombined lime that may be present. It will also readily be seen that fine grinding of the cement clinker greatly assists this operation by causing the particles of cement to be exposed in a state of minute subdivision to the neutralising effects of the atmosphere. "The setting of cement" (I quote from Mr. Butler's book), "according to Le Chatelier, is caused by the formation of a super-saturated solution, which subsequently deposits crystals; the rapidity with which these crystals are formed constitutes the rapidity or slowness of the setting." In other words, the more water is added to cement the more slowly it will set. When water is added to cement, and the mixture is shaken out on a piece of glass or slate, the water rises to the top, and the pat has a shiny appearance. Presently the pat becomes stiff, and loses its glossy skin. It is then said to have "set," and the time that has elapsed between the addition of water to the cement and its disappearance from the surface of the pat is called the time of "initial set." After this has taken place, the pat continues to harden till it will resist the pressure of the thumbnail, or till practically no indentation is made thereon by a Vicat needle, having a flat point 0.1 inch diameter, and loaded with a weight of 3 lbs. The cement is then said to be "hard set." Any disturbance of the cement after the initial set has taken place destroys the formation of the crystals, and has a disastrous effect upon its subsequent hardening. Setting of cement, being a chemical action, is affected by variations in temperature, *i.e.* accelerated by heat and retarded by cold. The fineness of cement has also much to do with the set, *i.e.* the finer it is the more quickly will this action take place. It is consequently apparent that the effect of high temperature, such as we frequently have here in the summer time, upon finely-ground cements may be to

make them so quick-setting as to be quite unusable, and would appear that under certain conditions fine grinding may be overdone.

Cement is tested by chemical analyses for detecting the presence of adulterants. For expansion, by pats made in air and when "hard set," placed in hot and cold water; for tensile strength, by briquettes made with neat cement or cement mixed with standardised sand in certain proportions, and broken at fixed dates, generally 7, 14, 21 and 28 days, 3, 6, 9 and 12 months. These tests, to be of any real value, can only be carried out satisfactorily by a skilled tester, and in a properly appointed laboratory. The ascertained fact that about 25 per cent. of lime in cement separates out in the form of hydrate upon the addition of water has caused investigations to be made, notably by Mr. Michaelis, with a view to, if possible, fixing the hydrate, and thereby adding to the efficiency of the cements, the idea being to incorporate with the cement substances containing soluble silicates which will combine with the liberated hydrate of lime; such substances are santorin, earth, trass and puzzuolana. A legitimate attempt in this direction has been made in the manufacture of what is known as silica Portland or sand cement, which is Portland cement with a greater or less proportion of added quartz sand, the two being intimately mixed, and ground to an extremely fine powder by means of special machinery. Now, the fact remains that quartz sand in its native state contains no appreciable quantity of soluble silica, and, whilst it is claimed that the extremely fine grinding to which the sand is subjected in the process of manufacturing renders it in some degree soluble, very complete and conclusive experiments made by the well-known chemist, Professor Lunge, of Zurich, go to show that up to three months no combination takes place. Such an authority as Mr. Kelway Bamber is, however, of opinion that at later dates chemical combination does to some extent take place. The merit of this material (sand cement) appears to be that the addition of the sand to cement retards the set of the latter sufficiently to permit of its being used with safety, although ground to an impalpable powder. This extremity of fine grinding has the advantages of developing the strength of the cement to the utmost, and by exposing to the neutralising effect of the atmosphere every particle of uncombined lime it may contain renders the cement absolutely free from expansion. There is also the advantage of obtaining denser mortar, owing to the extreme fineness and greater bulk of sand cement, and, further, a prospective increase in strength due to probable com-

### BROAD SANCTUARY CHAMBERS,

### WESTMINSTER, S.W.

ation at later dates between the finely-ground sand and  
erated hydrate of lime I think there is little doubt that for  
ertain classes of work, notably marine construction, silicated  
ement will be found to be a very suitable material, this view  
ing held by such an eminent authority as Dr Michaelis. In  
s connection I should like to read to you what that authority  
s to say about the action of sea water on concrete :—  
Portland cement, which is not protected by a coat of calcium  
arbonate, and which is not impervious to water, can never  
rmanently withstand the destructive action of sea water in  
nsequence of the action of sulphuric acid salts and even of  
lorides, *eg.*, chloride of magnesium. The sulphuric acid  
its totally destroy the cement through the tendency to 'blow-  
g' caused by the basic calcic sulphate which is formed. The  
loride of magnesium dissolves the lime, chloride of calcium  
ing formed and magnesia separating out." Again :—"Cement  
or in alumina and ferric oxide, but rich in silica, should be  
ed, for aluminate and ferrate of lime are not only decom-  
sed and softened rapidly by sea water, but they also give  
se to the formation of double compounds, which in their turn  
destroy the cohesion of the mass by producing cracks, fissures  
d bulges. The salts contained in sea water, especially the  
lphates, are the most dangerous enemies of hydraulic cements  
he lime is either dissolved and carried off by the salts, and the  
ortar thus loosened, or sulphuric acid forms with it crystalline  
compounds as basic sulphate of lime, which are segregated forcibly  
the mortar, with a large quantity of water of crystallisation,  
and consequent increase in volume results." (Paper No. 2,592,  
Minutes of Proceedings Inst. of C.E., April 1892.) The use of  
silicated cement in marine construction is advocated, (1) be-  
cause its greater bulk is likely to give a dense and, therefore,  
impermeable concrete ; (2) because the lime is reduced to the  
minimum, and there is, therefore, less present to be acted upon  
y the sea water salts ; (3) because the added material is  
early pure silica, which is not acted upon by the sea water  
alts, and which is present in a form probably capable of  
ring the liberated hydrate of lime.

There are, however, other and quite illegitimate additions,  
uch as the practice carried on by some of the smaller Thames  
akers of mixing Kentish rag, a sandy limestone, with Port-  
and cement. Messrs. Stanger and Blount, by experiments  
ndertaken at the instance of the London Chamber of Com-  
merce, have conclusively shown that Kentish rag can only act  
s a diluent, and the best that can be said for it is that beyond  
his, its effect is harmless. This, unfortunately, cannot be said

of another form of adulteration, viz. the addition to cement of  
blast furnace slag. Ordinary slag contains at least 1 per cent.  
of sulphur in the form of calcium sulphide, which, slowly  
oxidising, would be likely to expand in the mass of set cement,  
with injurious results. A cement examined by the writer some  
time ago gave the following analyses :—

Insoluble in HCl	13.8	per cent.
Silica alumina and ferric oxide	27.11	"
Lime	48.90	"
Sulphuric acid	2.06	"
Loss at red heat	6	"

Upon addition of HCl, an unusually large quantity of sul-  
phuretted hydrogen was given off, and the mass had a ten-  
dency to blacken, showing that the adulterant was in this case  
slag. The cement gave low tensile results, some 169 lbs., at  
seven days, and was altogether a most inferior article. The  
danger to the user was that the cement, which was of European  
manufacture, was labelled and sold as a *bona fide* Portland  
cement. Instances such as this emphasise the desirability of  
establishing a public laboratory where users can have materials  
tested and examined for a moderate fee. I think it very possible  
that in course of time an institution of this description would  
derive sufficient revenue from this source to become prac-  
tically self-supporting.

Lastly, the application of Portland cement. The enormous  
increase which has taken place in latter years in the manufac-  
ture of this article indicates the extent to which it is now used.  
England, at one time the home of cement-making, has been  
outstripped in this branch of manufacturing chemistry, as in  
others, by Germany. Cement is largely manufactured in nearly  
every European country, in India, Australia, New Zealand,  
China and Japan. In the United States of America during the  
last few years many cement factories, some of them of great  
size, have been erected, and to-day the output of these is com-  
puted upon a low estimate at some 10,000,000 casks per annum.  
Cement is essentially an engineering and constructional  
material, and it is, I think, a matter for regret that it is so  
largely used for decorative purposes, to the exclusion of the  
warm-coloured brick and sandstone. Cement fronts are far too  
common in Melbourne ; they do not accord well with our  
bright skies and sunshine.

Notwithstanding the universal use of cement, there is,  
unfortunately, a great deal of ignorance amongst users as to its  
nature, behaviour and treatment. It seems an anomaly that a  
comparatively delicate chemical compound, prepared with

great care, and by means of expensive machinery, a compound the peculiarities and behaviour of which have been, and are constantly being, investigated at the expenditure of much time, thought and labour by many eminent chemists and engineers, should in too many cases be handed over to the tender mercies of a most ignorant class of labour. I regret I am also bound to say that many engineers, architects and clerks of works are lamentably ignorant of the nature of this material. I have many times seen perfectly sound cement condemned because work carried out with it had failed, the failure being shown upon investigation to be due to the ignorance and carelessness displayed in its application. This, I think, indicates the desirability of more widespread technical knowledge respecting the behaviour and nature of constructional materials. Before closing this paper, I will detain you a few minutes whilst I read in an epitomised form a few directions to users of cement. Take great care that all materials to be used with the cement, such as sand, bluestone screenings, bluestone metal, or other suitable substances are free from earth or clay. Use clean, sharp sand only. Avoid using fine loamy sands. Use clean water only. Mix the cement with the other materials in a dry state, after which add sufficient water to work the whole into a stiff mass. When thoroughly mixed, get concrete into required position as quickly as possible, then ram until water appears on top. Note that it is safer to err upon the side of an excess of than too little water. I wish to especially direct your attention to this point, because upon it there appears to be some conflict of opinion. Some authorities appear to take a view contrary to the one I have expressed; for instance, Professor C. D. Jameson, an American writer, in his book, "Portland Cement; its Manufacture and Use," says (page 112):—"The one thing to be guarded against in the use of cement is the superfluous use of water. There is very little danger in using too little." Now, it is unquestionably the case that the maximum strength is only to be obtained by using exactly the necessary amount of water; also, that any excess certainly tends to weaken the concrete, at least at early dates. I think, however, the two opinions, although apparently equal and opposite, are sound, both in principle and practice, and that they are intended as guides to operators working under different conditions, or, rather, as rules to be observed first in the laboratory, second, on the works. The object of testing cement in the laboratory being to ascertain the greatest strength as well as the defects, if any, of the sample under examination, it is necessary, when gauging briquettes, to guard

against using any more water than is absolutely required, and this for the reason already given, viz. that any excess tends to weaken. But the tester also knows the infinitely greater danger of using too little water, and should the sample under manipulation evidence signs of having been insufficiently moistened, he will at once set it aside and begin anew with a fresh batch. Now, in the laboratory conditions are, one might say, ideal. The manipulator is experienced and skilled, the atmospheric temperature can be regulated, the quantity of cement being handled is small in bulk, and, when gauged there is no delay in getting it into the moulds. Moreover, the briquettes when gauged are kept in a moist atmosphere for twenty-four hours, and are thereafter placed in water.

Now, I need hardly say that on the works such conditions are never obtainable. Delays may take place, allowing the cement to begin to set before the concrete has been got into position. The aggregate, such as broken brick, may be porous, and absorption of water may go on to a dangerous extent after the concrete has been laid. This, added to inevitable evaporation in hot weather, and the subsequent hardening of the cement will be interfered with. Further such work is always carried out by unskilled and unobservant labour. It is the case of two evils—choose the lesser. Unquestionably it is better to have a rather weaker but sound concrete than run the risk of getting an absolutely useless and rotten one. Do not use salt water for mixing concrete or mortar to be used in house construction, also see that sand employed for this purpose is free from salt. The presence of salt in mortar joints or plasterwork causes damp walls. Note that salt retards setting of cement. Do not at any time make up more concrete or mortar than is required for immediate use. On no account attempt to use any concrete or mortar that has been allowed to stand till set. Note that cement sets more rapidly in hot weather. Avoid doing any cementwork, especially rendering, on hot wind days. Keep freshly-made cement work well protected from heat or frost till hard set, in the former case by covering with well-wetted, and in the latter with dry bags. When cementing outside, rake out mortar joints and wet walls thoroughly before applying first coat. Score first coat well and thoroughly wet it before putting on finishing coat. On the day following that upon which the cement plastering has been floated down, and for six days thereafter, drench the work as frequently as possible with clean water. Too much attention cannot be paid to this, particularly in hot weather.

# The Architect.

## THE WEEK.

A MEETING of the executive committee of the Liverpool Cathedral was held on Monday. It was reported that—  
(a) In answer to the advertisement inviting architects to submit drawings or other illustrations of their works for examination with a view to the selection of the architects to compete in the final competition, 102 portfolios had been received. Of these seventeen are from foreign countries and eighty-five from Great Britain. Of the latter one is from Ireland, eight are from Scotland and seventy-six from England, the latter including eight works of Liverpool architects. (b) That by the courtesy of the Liverpool Library committee the designs are being hung in the vacant rooms of the autumn exhibition, and the selections from those sent in will cover the walls of no fewer than three large rooms. The committee consider that it is undesirable to admit the general public to view the drawings at the present stage, and that it would be fairer to all concerned if the advisers were allowed first to view the designs and drawings with an open and unbiassed mind. These advisers (Mr. G. F. BODLEY and Mr. R. NORMAN SHAW) have arranged to begin their examination next week, and will submit a report to the committee.

OVER half a century has elapsed since the publication of the Ancient Laws and Institutes of Ireland was commenced under Government authority. An extraordinary opportunity presented itself, and to the surprise of many was turned to account. Ireland then had two really great archæologists in JOHN O'DONOVAN and EUGENE CURRY, who were willing to devote the benefit of their lore for less wages than were paid to journeymen. There were other archæologists prepared to participate in the work, but they took care to avoid all the drudgery which was necessary. Ireland was possessed of a body of laws which had been expounded by the judges or brehons. Many of the decisions may have been given prior to the Christian era. Everything was regulated by them; the allotment of pasture, the respective ranks of the members of a tribe, the treatment of strangers, the punishment of crimes, &c. Erics or fines were universal, and were imposed by strict rules. For instance, if a man cut the trunk of an oak, ash or fir tree, he had to surrender five cows; if he injured any of the branches, one that was two years old was sufficient. But for cutting the trunk of an elm, birch or hawthorn the fine was only one cow. Murder on the highway was punished by a fine of twenty-one cows. The definitions of various things suggest the strength of authority. A fence in a field was to consist of a trench, 2 feet in width at bottom, 3 feet in depth, and 3 feet in width at top, with a ditch raised on one side, of these dimensions and materials, viz. twelve hands of stonework 3 feet thick, twelve hands of sod over that, then wooden stakes 2 feet asunder driven firmly into the sod, laced with wattles, and rising three hands over all. To break any part of such a fence was a serious crime, and the penalty was in proportion to the number of stakes removed. The language in which the laws and regulations was expressed is to a great extent obsolete, and the difficulties of translation were immeasurable. This great archæological work has been at length completed, the fifth and sixth volumes having appeared, and the commissioners have a right to say that they have placed in the hands of Celtic philologists and philosophical jurists at home and abroad an important body of materials which must throw the most valuable light on the legal institutions and social system of ancient Ireland.

ONE effect of the Workmen's Compensation Act is to make people in general conclude that contractors or undertakers are alone to be held responsible for accidents, and that contributory negligence by other parties is of little or no account. This has been exemplified in the case of GILES v. the Aldershot Urban District Council, which was tried in the Hampshire Assizes. The plaintiff was a work-

ing painter who was engaged by a contractor to paint street lamps. While standing on a ladder at work the lamp revolved, the ladder was moved and the plaintiff fell to the ground, injuring his spine in such a way that he is not likely to recover for several years. If an action of the kind were taken prior to 1897 there is little doubt the plaintiff would have succeeded, for it was the duty of the Council to have ensured that whoever was employed on the work had a safe article to work upon. It was not disputed that the painter was seriously injured. The whole question was on whom the liability should fall, and it was contended by counsel for the defendants that the action should have been brought against the contractor. Is it the duty of a contractor who will only receive a very small sum for painting a lamp to test the possibility of the lamp turning round, or in any other way becoming a source of danger? The manufacturer of the lamps said he did not fix them, and, as the screws and bolts might become rusty, there was a likelihood that motion would follow. The Council by their officers would alone be acquainted with these circumstances. It was maintained for the Council that they were not liable for latent defects, and that the plaintiff used a single ladder instead of a double one. But there were no instructions to use a double ladder. A verdict was, however, returned for the defendants, and it remains to be seen whether, if there should be an action against the contractor, he will be as fortunate as the Council.

"WHAT'S in a name?" is a question which has often given rise to discussion. Every one who has had to arrange the disposal of property will say that the name it bears has much to do with its success as a marketable commodity. A more convincing example of an unsuitable title could hardly be found than the property belonging to the late Sir RICHARD WALLACE in the Bois de Boulogne. The road between Sèvres and Neuilly bounds it on one side; it is near the racecourse of Longchamps, and the Seine is in the vicinity. Yet since the death of the most generous philanthropist Bagatelle has been lying unoccupied because no purchaser can be attracted. The only reason which can be offered is, we imagine, the name. To call beautiful and valuable ground a bagatelle is to suggest there is something trifling about it as a property, or that it was occupied by people who treated everything as bagatelles. The earliest mention of it is as a residence belonging to a daughter of the third Prince de CONDÉ. Then it passed into the possession of the Comte d'ARTOIS, a brother of LOUIS XVI. He made a bet with MARIE ANTOINETTE that he would construct a new château in a month, and he won, but he paid 600,000 francs to the builders. Then came the Revolution, and the "folly" was turned into a restaurant. On the Restoration CHARLES X. obtained the property, which cost him so much. He bestowed it on the unfortunate Duc de BURY, and finally it was acquired by the Marquis of HERTFORD. The château which BELANGER designed has been subjected to some alterations, but it still retains much of the genuine charm of the eighteenth century. The decorations are admirable, and, indeed, its last possessor could not live there unless much that was beautiful met his eye everywhere. Why it remains unoccupied is not easily decided, and the most plausible explanation is that the title is not well adapted to characterise the residence of a millionaire.

A SPECIAL thanksgiving service for the completion of the restoration of the west front of Peterborough Cathedral will be held on July 27. The work of reparation on the west front has been successfully completed, and all scaffolding connected with it was removed some weeks ago. The effort for rendering the west front permanently safe, involving also the strengthening of the foundations of the great transepts, has been carried out at a large cost. But whilst the expense incurred on the west front has been practically met, there still remains a sum of about 1,700*l.* to be raised and spent on finishing the work on the transepts by removing the strong timber supports, by making good all fractures, and generally by perfecting in detail what has been so well begun.

PAINTERS' ARCHITECTURE: JULIO ROMANO.

## THE FIVE ORDERS.\*

**A**MONG the gifts with which antiquity has enriched us we must consider the Five Orders as of especial importance. Not merely have they furnished us with ready-made columns, of which one variety or all may be used at discretion in the same building. Columns were not confined to Greece, and examples could be copied or altered from ancient originals in other lands. But the great advantage of the Five Orders, as we have inherited them from Greece and Rome, is that they provide us with a standard of proportion and of treatment which has been accepted during many centuries by architects. It is true their claim as paragons has been continually disputed, and our own time exemplifies revolt against them. We can see around us columns which do not correspond with any time-honoured examples. In some instances the shafts are drawn out to a remarkable height, as if tenuity were the foremost virtue in a column. All things go by opposites, and stumpy columns are also introduced, and are taken to be evidence of vigorous treatment. Originality, in fact, is by some designers believed to consist in departure from precedents. Whether the change brings an increase of beauty with it which excels what is found in the Classic example is not reckoned. The courage which is shown in the revolt is thought to be sufficient and more characteristic of talent than respect for the forms and proportions which for so many ages gave pleasure to cultivated men.

The old influence is not yet, however, at an end. All the efforts to devise a sixth order have failed. It may seem unworthy in the eyes of reformers that we should still be enthralled to forms which were created at so remote a period, but until something better can be evolved it is no more than common sense to make the best of our inheritance. The circumstance that in our time, when license is encouraged to the utmost, four editions of a volume containing details of the orders have been called for should be enough to persuade the most sceptical to acknowledge that the sway of Classic orders continues to be still powerful over the minds of men.

The reason for this, as we have said, is not merely that we have a supply of pleasing patterns, but that we have also an embodiment of practice that we can prize as a standard. In the orders it has been said the whole genius of the art has been displayed. It is possible that the Greek and Roman architects would be amazed at so much reverence being bestowed on a series of columns which

may not be the best of their respective classes. But in those days there was a pervading opinion which was equal to any formulated standard. What REYNOLDS remarked of academies of art is applicable to the life led by artists in several Greek cities and in a lesser degree in Rome. "Every seminary of learning," the President declared, "may be said to be surrounded with an atmosphere of floating knowledge, where every mind may imbibe somewhat congenial to its own original conceptions. Knowledge thus obtained has always something more popular and useful than that which is forced upon the mind by private precepts or solitary meditation." The variations which we find in examples of the orders testify that the repetition of stereotyped forms was not in favour, especially with the Greek artists, but beyond all other races they contrived to be subservient to opposite qualities, and the limits of the variations denote a respect for authority. What their standard was we can never discover, for the Greeks who wrote books did not at any time condescend to explain the theories of architects, or, indeed, to express much admiration for a building.

Whatever might be the original theory of architectural art, there is no doubt that the Five Orders have served for a sufficiently long period to be established as exemplifying a theory of art. Indeed, without their influence chaos could hardly have failed to have come again. It is only necessary to look at the condition of contemporary painting and sculpture in order to realise how much we owe to VITRUVIUS. Painters and sculptors have nature before them, and they always are willing to acknowledge an admiration for her productions. But countless are the ways in which natural forms are shown. Not to go through the history of art, let us confine ourselves to the most modern period. Between pre-Raphaelitism at one pole and Impressionism at the other pole, there is such a surprising number of interpretations, we can hardly believe that two men see nature under a like aspect or are sufficiently courageous to agree in accepting phenomena in common. It is enough to bring failure to an artist when it is asserted that he views things like one of his brethren. In the representation of commonest scenes individuality is expected to manifest itself, or, in other words, there must be no agreement in the manner of presenting nature to our eyes. In sculpture the variations are no less pronounced, and the recent glorification in England of M. RODIN arose from his daring departures from the styles of all preceding sculptors. Owing to the difficulty of finding a standard of art, it would be hazardous to say that M. RODIN is in error, but if his ways are correct then the Greeks and Renaissance masters, with all their modern successors, must have failed to understand the province of their art.

\* *The Orders of Architecture, Greek, Roman, and Italian. A Selection of Examples from Normand's "Parallel" and other Authorities, with Notes.* By R. Phené Spiers, F.S.A. Fourth edition, revised and enlarged. (London: B. T. Batsford.)

For architecture, nature has supplied no model. Unlike the painters and the sculptors, there is no High Court of Appeal to be found in created things. The ancient Indians and the Egyptians have been thought to express their impressions of nature in colossal and mysterious temples, but that is a subject which it would be hard to determine. The followers of the new art in France and Germany may have some desire to utter thoughts which are beyond the powers of their minds to fathom, but it is only to the initiated that their buildings can have any meaning. From the confusion something clear in course of time may be elicited, and architects have as much right as poets, painters or sculptors to hope that one day they may be enabled "to snatch a grace beyond the reach of art." Meanwhile it seems to be necessary to go through a long period of license exceeding all varieties of rococo.

Without flattering ourselves, it must be allowed that in the present age we are more entitled to hope for a new style of architecture than the majority of our predecessors. We have, at least, analysed all styles, and have drawn or photographed the details of what may be called the provincial idioms of the art. We can take a building in pieces and put the parts together in a new arrangement. Our new combination or combinations, although they might not be accepted generally in England or elsewhere, would, at least, be preferable to those of WILLEY REVELEY or BATTY LANGLEY in the eighteenth century. Theirs were not the only freaks, but the old Five Orders were sufficient to condemn them when they were contrasted, and in all other cases the power of the same arbiters could not be resisted.

Once it was believed that the proportions were settled absolutely and for ever, but it should never be forgotten that in the orders we have much more than a series of proportions. They form as it were an epitome of decorative composition. The fluting suggests what can be done by means of right lines placed at regular distances. As has been well said by REID, regularity expresses design and art, for nothing regular was ever the work of chance. There is also the comparison between vertical and horizontal lines, between planes and curved surfaces. The ornament affords a most marked contrast to the right lines of the mouldings which enclose it. The problems connected with the proportions of the columns are endless, and, indeed, it may be said that the orders alone have been able to engross the attention of the mathematician and of the æsthetician. The interest displayed in the orders during so many centuries could not have been sustained if it were not for the multitude of speculations which a careful study of the forms will inspire. Many have seen in them indications of racial characteristics, and the anatomist as well as the evolutionist have found materials for contemplation in the details. Latterly the development of the orders has been investigated. Yet with all the attention which has been devoted to them it cannot be said that their interest is exhausted.

The architect has to deal with the orders with a view to their application. He may not have the time or skill required for the understanding of the differences between details. It is, however, of importance that he should know there are differences which have been sanctioned by adoption in famous Classic buildings. In that way the adherence to one type of each order which was common in England during the eighteenth and nineteenth centuries will not be regarded as praiseworthy. The extent of parallelism between several types has been exhibited by CHARLES PIERRE NORMAND, the French architect, in a work published in Paris in 1819, which forms the basis of the selection by Mr. R. PHENÉ SPIERS, and which has now established itself in England as a necessity for students. The plates do not need much commentary, for by adopting the system of modules the relation between the parts becomes evident to the eye as well as to the understanding. In the latest edition notes have been added on the origin and development of the orders. Their true history is apparently beyond research. The titles of the three principal orders—Doric, Ionic and Corinthian—may for all we know be incorrect as indications of origin. But it has been ascertained from remains that early Doric bore more resemblance to timber construction than is seen in the columns of the Parthenon. In describing some of the characteristics of the Temple of

Corinth and the Temple of Heræ at Olympia, Mr. PHENÉ SPIERS says:—

The two structures just considered show (A) that the walls of the earlier temples were built in rubble stonework laid in clay mortar or in crude brick raised on a base of stone in two or more courses, and that the outside of the latter was masked or protected by vertical slabs of stone on the outside. (B) That the columns of the earliest peristyle known were in wood, raised on a base of stone rising about 2 inches above the stone paving, and that their wide intercolumniation proved the superstructure to be in the same material. *Note.*—When the wood columns were replaced by those in stone we may assume that their bases were worked off as being no longer required. Mr. Thacker Clarke found a stone Doric column at Assos with its base still existing, and he contends that the base was afterwards merged into the stylobate, viz. the upper step of the Greek platform. (C) The closer intercolumniation of the angle columns would seem to have been suggested by the necessity of having a triglyph at the angle and all the metopes nearly the same size, and indirectly it implies that already at this early period the entablature consisted of architrave, frieze with triglyphs and metopes and a cornice. (D) The antæ and responds were originally in wood, either to protect the front of the antæ, or to assist with the columns in carrying the architrave beam of the portico. (E) The door-posts and lintels were also in wood, and to lessen the bearing of the lintel the door-posts probably inclined inwards, the ends of the lintel projecting beyond either side. The features which we have noted in these two early structures all seem to be based on constructive requirements. We have now to point out briefly how the forms thus created would seem afterwards to have been imitated as decorative features. A explains why in nearly all the Greek temples (those in Sicily are an exception) the outer walls of the cella have a dado of vertical slabs 3 to 4 feet high. The note added to B accounts for the disappearance of the base of a column originally in wood. C became the invariable rule in all Greek temples. *Note.*—There are exceptions to this which prove the rule. In the Temple of Corinth the metope nearest the angle was wider than the others, the angle columns not having been brought sufficiently close together. In the Temple of Ceres at Præstum the intercolumniation of the columns was the same throughout, and a metope found three or four years ago was oblong, being 11 inches wider than the other metopes. D accounts for the stone antæ and responds found in nearly all the Greek temples. E suggests the derivation of the architraves of the Greek doorway, the diminution of the width of the opening of the upper part of the doorway and the shoulder, as it is called, of the lintel.

The Ionic is described as having "two distinct types, one constructional, which had probably a wooden prototype, and the other decorative, with a metallic origin." A primitive example found at Naukratis, and now in the British Museum, was, when first seen, crowned with a volute, which unfortunately has disappeared. As regards the Corinthian, it is suggested that the name was derived from the use of Corinthian bronze for the capitals. The whole of the plates have been reproduced anew from the original engravings and drawings, and there is consequently no sign of the weakness which is observed in plates which are several times reprinted. The volume has gained so much repute it can dispense with further commendation, for it is certain to meet the requirements of more than one generation of students.

#### MODERN MURAL DECORATION.\*

IN dealing with art in its manifold forms sufficient allowance is not always made for that love of change which is inherent in human nature, or at least in modern men and women. Just as epicures become wearied of "toujours perdrix," there are excellent works of art which in course of time fail to please those who have grown familiar with them. A thing of beauty may be a joy for ever, but in most cases it attains that end through a succession of new admirers. To see boredom in its most pronounced form, it is only necessary to go into foreign galleries containing masterpieces and observe the faces of the guardians, especially whenever enthusiastic visitors arrive. This weariness has had divers consequences, and it is the cause of many of the experiments in the restoration of buildings, and especially of churches, which

\* *Modern Mural Decoration.* By A. Lys Baldry. (London: George Newnes, Ltd.)

have aroused so much indignation. There is a marvellous difference between the effect made by forms and colours on people who only see them occasionally, and it may be at long intervals, and on those who are compelled to gaze on them daily or weekly. This fact can be readily tested. Let a man who is familiar with art in public galleries and exhibitions go to some village for a holiday. When he first enters the old church he may be pleased by the change afforded from scenes with which he is acquainted. The attempts at illumination around the walls, the banners and embroidery, the ornament of the local house-painter, will at first gratify him by the desire to express reverence however imperfectly. But on the second or third visit everything will appear to have altered its character, and then the demerits become a distraction. The critic will probably acknowledge to himself that he would not have the strength to endure the spectacle for a year. If he be liberal and can judge others as he judges himself, he must pity the congregation who are compelled year after year to accept such adornment. The same cause may be pleaded in extenuation of the apathy to the works of old masters in Italian churches.

The authorities of foreign galleries, knowing the weakness of human nature, endeavour by rearranging pictures and statues to overcome the weariness and to produce a little novelty. There may be grumbling from those who care only for a few special works, and turn to familiar spots as if by instinct. But the majority of visitors are pleased. There would be an outcry from French amateurs if DA VINCI'S *Mona Lisa* were placed on some other wall in the Salon Carré of the Louvre. The crowds of people who only pay two or three visits to the galleries in a year would imagine they saw new beauties in the portrait if it were hung elsewhere.

The same peculiarity is to be observed in the fluctuations which arise in the value of pictures. MEISSONIER, whose works a few years ago were purchased at the rate of several pounds per square inch, there being an inverse ratio between the area and the price, seems to be now fast declining. Indeed, there is no better test of the variations in public favour than the records of auction rooms. With a cabinet or other easel picture, which cost a large sum of money, and in consequence was allotted the most prominent position in a man's collection, it is possible when there is a change of fashion or of taste to place the work in a more retired space, and in that way it need not be always manifested how unwise was the speculation, how defective the choice.

The facts we have stated should have their influence on the production as well as on the selection of mural decoration. Is there anyone living who is not thankful that the project for the decoration of St. Paul's Cathedral by REYNOLDS and the early Academicians was never realised? Bishop TERRICK was reputed to be an ultra-bigot because he refused to allow the cathedral to be painted in the grand style of Britain, but he is now looked upon as a prelate who was more advanced than his contemporaries. There never was a time when so much enthusiasm about art prevailed as in the days when the decoration of the Houses of Parliament was proposed. How many now regret the ruined condition of the frescoes, or would raise a finger to preserve them? Mr. BALDRY says:—

The artistic conventions which were then affected by the members of the British schools lent themselves but indifferently to the development of the decorative style appropriate to the medium, and the experience which the artists had of the methods essential for fresco was insufficient to enable them to overcome its mechanical difficulties. The paintings began soon after they were finished to show that they were incapable of resisting the climatic and chemical influences to which they were necessarily exposed in such a building, and many of them have since been going through a steady process of degeneration. In a few further instances experiments have been made by other British artists, but generally with little enthusiasm and with scanty encouragement from the public.

It should be remembered that the indifference to the fate of the Parliamentary frescoes does not altogether arise from the failure of the process. It is more owing to the composition and treatment of the pictures. If they were easel pictures or portable they would be hung in offices or committee-rooms, where far better works may be traced,

but as they are painted on the walls they must be tolerated so long as the fresco endures. Why should people be compelled to have decorations which they regard as inferior perpetuated for an indefinite period in spite of their defects? The answer to the question will suggest what is desirable in mural work.

When there is reference to this variety of art it is overlooked that before oil-painting was discovered wall-painting seemed to be the most efficient way of producing pictures. There were undoubtedly panels on wood and on metal at an early time, but on a small scale the effects of the dull colours was not impressive. CIMABUE was the disciple of a Greek mosaicist, and his works show that his experience was derived from employing tesserae rather than brush strokes. Wall-paintings were also desirable as substitutes for books, and long after Greece had fallen the Greek tradition apparently operated, by which it was considered unworthy for a private person to claim entire possession of a work of art. From the positions in which pictures were found—that is, on church walls—and the subjects they represented, the artists were obliged to be reverential or to assume that quality. The works were consequently the best that were obtainable. They could claim to have a close relationship with the buildings, for painting and architecture were assumed to be connected.

In our time there is less gravity of purpose. Decoration can assume a great variety of forms. But the doubts arise more strongly than ever whether it is wise or becoming to confer endurance on a class of forms which would be no less efficient if produced in a transient material. If we take some simpler kinds of wall decoration executed in our time it cannot be denied that they are less beautiful than wall-papering. In the majority of cases few would care to preserve wall-papers after the colours have faded or longer than the agreements in leases prescribe. Is it, then, right to endeavour to impart more durability to what is not so pleasing in appearance? Wall-papers are now subject to the laws of fashion, and it seems inequitable that painted decorations which may be ugly compared with them should be allowed to have no term set to their existence.

The rules should be equally applicable in other varieties of decoration, such as sgraffito, gesso or whatever method is employed for the repetition of forms. The Moors have, perhaps, given us the best lessons about the treatment of geometrical patterns in decoration. No kind of lace appears to be more intricate or puzzling to analyse than some of the plaster and tilework of the Alhambra. An invalid, especially if he is an artist, can hardly refrain from counting the number of forms which are repeated on the walls of his room, and of contrasting the differences between the elements which constitute the patterns. That is impossible with fine Moorish work. We may have read OWEN JONES, and by his aid discovered the simplicity which inspires so much prodigality. But to pursue the unity amidst the marvellous variety seems a task to which no mere spectator is equal. The sgraffito of Signor FORMILI and the gesso panels which recall "argosies with portly sail, like signiors and rich burghers on the flood, or, as it were, the pageants of the sea," by Mr. H. C. BREWER, alone among the illustrations of modern work in Mr. BALDRY'S volume have the exuberance which is desirable in what may be called secondary decoration. Very simple forms are hardly worth the trouble of reproducing in a permanent manner. If stencilling has to be used, it should not be poverty-stricken, but suggest compounds like those of the Japanese, which are inspired by a similar spirit as the Moorish plaster decoration.

Figurework in decoration should more especially be of a class which can combat, if not overcome, that desire for change which is a part of our being. The most remarkable productions of the kind in modern times were those by the late PUVIS DE CHAVANNES. The first illustration of a painting by him which appeared in a journal was one in *The Architect*, for at the time he was not appreciated in France, and none of the French editors would undergo the risk approving of his style. It was not then recognised by his countrymen that decoration ought to be subservient to architecture, and that forms or colours should be used which would make the walls, columns or panels near them become more effective. In most examples of French decoration, as in those by English

artists, the aim is to give prominence to the painting and the architecture is sacrificed without mercy. PUVIS DE CHAVANNES acted on another principle and, in a word, followed Greek tradition. His early decoration was therefore admirable. In course of time there was a change; simplicity ceased to be spontaneous. His figures affected to be unaffected. They were posed in a manner which no men or women would voluntarily adopt, and indeed the figures seemed to have been first modelled for the painter's use by a sculptor. The contrast between the painter of some of the panels in the Panthéon and the painter of the big pictures of the Sorbonne exceeds anything known in the history of art. We have no wish to condemn the artist's later works. He could have made them the elements of a different style of decoration, but the pity of it was he was afraid to abandon his earlier principles, and thus evolved compositions which are neither Classical nor Mediæval, neither Greek nor French, and more sculpturesque than natural.

PUVIS DE CHAVANNES was only one amidst many French decorators. The series from the Paris Hôtel de Ville and the various Mairies we have published will demonstrate the diversity of styles that was encouraged by the municipality. In the majority of cases the selection was by competition, and the number of artists who are capable of excellent work is wonderful. In England the failure of the experiment in the Houses of Parliament obscured decoration for a long time. Prejudice is overcome with difficulty in this country, and it was impossible for anyone to see so many wrecks at Westminster without concluding that decorative art is not suited to our climate or materials. The delay, however, has not been without its compensations. To supply the deficiency of fresco, mosaics, terra-cotta, plaster, gesso, tiles, faience and other ceramics, sculpture in relief, have all received attention, and we are now enabled to adorn walls without any alarm about decay. It should, however, be admitted that some of the painted work is freakish, and not of the kind which a spectator acquainted with art would wish to see standing for ever. Decorative painting is still thought to be a simple, expeditious class of work, and it is not to be expected that a man of business who can easily secure a large sum for an easel picture will be willing to go through the long process of thinking and experiment which is essential for decoration, and perform the work for an insignificant price. Mr. BALDRY'S volume will enable the public to realise that a high class of decoration is obtainable; that class is alone worth execution, and it depends mainly on lovers of art whether the work deserves to survive or should appear in a form that is suited to the season, and which will not be regretted when superseded.

### EXPLORATIONS AT KERMANSHAH.

IN an article in the *Morning Post*, Mr. H. J. Wregham, describing his Persian experiences, says:—On the tenth day from Bagdad I came at noon to the crowded bazaars of Kermanshah. We were joined two days later by M. Pierre de Jecquier and M. Watelin, who were making a cross-country journey from Susa to Paris, where an exhibition of Persian antiquities was to be held. These gentlemen had been particularly fortunate at Susa in finding a large black marble column covered from head to foot with cuneiform inscriptions, which should throw much light on the history of that ancient capital, and they have this advantage over the German explorers at Babylon, that they can take to France everything that they find at Susa. Originally the concession permitted them only to share equally with the Persian Government, but they were molested and attacked by the natives at Susa, and by way of compensation they obtained the right to take everything they require from Susa, though in other parts of Persia the Shah may claim his share. Generally they work four or five months at Susa, and then, before the winter in Susiana gets unbearable, they migrate to the northern parts of the country, where there are ample fields for the explorer. In this way they gradually unfold the history of past ages, and at the same time add considerably to our present incomplete knowledge of Persian geography.

Kermanshah itself is not without its historical remains. There are no more interesting relics in Persia than the rock sculptures of the Shapurs at Tak-i-Bostan, just four miles from the city, and those of Darius at Bisitun, about twenty-five miles out on the road to Hamadan. The first are easily visited in an

afternoon's walk or ride; the second stand right over the caravan route, and are wrought on the face of the great precipice which terminates abruptly the ridge of high mountains facing Kermanshah. In both places a stream of fresh water gushes out from the rock as if the staff of Moses had been employed, from which one might infer that even in the early days of the Achæmenian kings the spontaneous bursting forth of a large volume of water was worthy of the notice of the sovereign in a thirsty land like Persia, if he did not indeed take the entire credit for the phenomenon. Next year a number of French archæologists are to visit Bisitun and treat the work of Darius to a thorough overhauling. Till then the admirable summary of Lord Curzon supplies all the available information on the subject of the Kermanshah rock sculptures.

In other respects the place outside the hospitable walls of the Custom House has but few attractions. There are, indeed, here as elsewhere in Persia, a few striking examples of the wretched improvidence of the people and their rulers. There is the Imadieh, on the banks of the Kara Su River, half-way between the town and Tak-i-Bostan, once a beautiful summer residence, with a lovely garden and well-appointed anderum (women's quarters), built by the Imad-ed-dowleh not forty years ago, and occupied by the late Shah when he made his pilgrimage to Kerbelâ. The story goes that when the famous Governor of Kermanshah offered the palace as a present to his Sovereign, the Shah asked how much it had cost, and, on being told 100,000 tomans, was graciously pleased to restore the gift to its donor and to accept the money value instead. However that may be, the Imadieh is now a complete ruin, where the villagers go to collect bricks, and not a solitary tree is left standing in the once lovely garden.

### CANADIAN SOLDIERS' MEMORIAL FUND.

IT is proposed to erect a monument in Montreal in honour of the Canadian soldiers who fought in South Africa, and to commemorate Lord Strathcona's patriotic act in equipping a regiment of mounted troops. The committee invite designs for the monument. These must reach Mr. Davidson, hon. secretary, London and Lancashire Chambers, Montreal, by November 1. The designs must be identified by a motto only and be accompanied by a sealed envelope enclosing the name and address, with the motto only on the outside. An expert will be appointed to aid the committee in their selection. The cost of erection, exclusive of foundations up to the ground level, must be within the money at the disposal of the committee, namely, from 5,000*l.* to 6,000*l.* Competitors may forward a model instead of, or in addition to, drawings, but in case a model is not sent the drawings must include a perspective view, clearly showing the design in every respect. Two prizes of 50*l.* and 25*l.* are offered.

### THE SOCIETY OF ARTS.

THE Council have awarded the Society's silver medal for the following papers read before the Society during the session 1901-2:—At the ordinary meetings—To J. Gordon Parker, Ph.D., for his paper on "Leather for Bookbinding"; to Herbert Stone, for his paper on "The Identification of Wood and its Application to Scientific and Commercial Purposes"; to Professor George Forbes, F.R.S., for his paper on "Range Finders"; to Professor Roberts Beaumont, for his paper on "Recent Inventions in Weaving Machinery"; to E. Price-Edwards, for his paper on "Sound Signals"; to J. Clifton Robinson, A.I.C.E., for his paper on "Electric Traction: London's Tubes, Trams and Trains"; to Major-General Sir John F. Crease, K.C.B., for his paper on "Cuba and Gibraltar"; to Edward T. Scarnmell, for his paper on "The Timber Resources of the Australian Commonwealth"; to H. Warington Smyth, for his paper on "Boats and Boat Building in the Malay Peninsula." In the Indian section—To Professor Wyndham R. Dunstan, F.R.S., for his paper on "The Coal Resources of India"; to Thomas William Holder, C.S.I., for his paper on "The Indian Famine of 1899 and the Measures taken to meet it"; to Thomas Jewell Bennett, for his paper on "The Past and Present Connection of England with the Persian Gulf." In the colonial section—To Commander B. Whitehouse, R.N., for his paper "To the Victoria Nyanza by the Uganda Railway"; to W. T. Preston, for his paper on "The French Canadian Relationship to the Crown." In the applied art section—To S. Alsey Ricardo, for his paper on "The Architect's Use of Enamelled Tiles"; to the Rev. Henry Thurston, S.J., for his paper on "The History of the Rosary in all Countries."

A Commission, consisting of legislators, men of science, hygienists, and nine members of the Seine General Council, will meet to-day to frame sanitary regulations for Paris as regards houses, streets, sewers, water and epidemics.

HIS MAJESTY KING EDWARD VII.

BY WALTER MERRETT.

*From the Bust presented to the Corporation of London by Mr. T. V. Bowater, C.C.*

A MORE opportune time than the present could not be found for the presentation of a bust of the KING to the City of London. HIS MAJESTY'S condition and the courage with which he has borne his illness have endeared him, if it were possible, more than ever to his subjects. Mr. T. V. BOWATER'S gift could not therefore fail of acceptance by the City Lands Committee of the Corporation. The bust has, moreover, qualities which recommend it as a

likeness and as a work of art. The plaster model in the Royal Academy is admitted to be one of the most successful in the Central Hall. It has marvellous plasticity, and is therefore well adapted to the expression on the royal countenance. It will be observed that a national character is imparted to it, for the KING wears the Orders of St. Patrick, the Thistle and the Bath, in addition to the chain of the Sovereign of the Order of the Garter.

#### THE LATE M. BENJAMIN-CONSTANT.

THE Paris correspondent of the *Times* writes:—

May I be permitted to speak once more of M. Benjamin-Constant, whom cruel death forced to lay down his brush at the very moment when the artist shone in all his brilliancy and when for many long years he might have been able to add to his work and to his glory? M. Benjamin-Constant was conscious of his approaching death, and when he was certain that the end was near he said, "I desire that after my death all that remains of my work may be taken to England, to that country which I have learned to love with all my heart, and which has become my second artistic country." Immediately after his death the gracious English Sovereign Queen Alexandra, with that instinctive feeling which distinguishes the minds of those

women who occupy lofty positions, sent to his widow a telegram in the course of which she said, "Your illustrious husband, so loved and esteemed everywhere, and especially in England." Her Majesty thus confirmed the dying words of the artist.

What M. Benjamin-Constant desired should be done is soon to be accomplished. On the 19th and 21st of this month there will be held in one of the London auction rooms a sale of 130 or 140 large paintings left by the eminent French artist and of 60 or 80 smaller works, landscapes, sketched by him in the different countries he visited. I went the day before yesterday to the large studio at Neuilly, where he worked during his latter years. This studio in the Boulevard du Château was formerly used by Puvion de Chavannes, and I believe it was there that the distinguished artist Munkacsy finished some of

his paintings. A great many persons know Benjamin-Constant only as a superior portrait painter. His success in this branch of art has made them rather unfairly forget his admirable collection of Oriental pictures—"Mahomet II.," "Les Chérifas," "La Justice du Chérif," just placed in the Luxembourg, "Les Funérailles de l'Émir," and many others. On my visit to Neuilly I was able to admire some of these pictures, which will now be offered to the public. Prominent among them is a variation of the "Mahomet II.," a real pearl, which may rank among his finest works. Pictures mostly executed in Morocco, and preserving the charm of things really seen and felt, include "Les Favorites," "Les Femmes du Caid," an exquisite canvas full of mystery, "Les Prisonniers Marocains," "Le Roi du Désert," "Une Danse d'Almée," an Arab court with a warm ray of sunshine overlooked by terraces with balconies and sumptuous draperies, "Le Tigre Favori," obviously inspired by a passage in Victor Hugo's "Orientales," Arab interiors, seraglio views, and a number of other sketches. There are also the sketches for large decorative works, such as the entry of Pope Urban II. into Toulouse Cathedral, the resurrection of Lazarus, and the entombment of Christ.

As for the small landscapes, but few people are aware of this phase of Benjamin-Constant's talent. Wherever this great traveller went he made sketches, which he jealously preserved, and these will now be a revelation. There is Venice, red and white, New York, immense London, which he liked so much and the atmosphere of which he has so well grasped, Rome, above all the sea—the waves which he painted as few have done, the sea at night, at dawn, by day, always new, always grand, on which you feel that he allowed his dream to float.

I feel bound, as a duty to readers who worship art, to announce this sale, so that Englishmen may render a last homage to a man whose art seemed always enriched by some new aspect through those frequent visits to England which he said always made his heart throb and rendered his brain active.

## TESSERÆ.

### Composition in Gardening.

GARDENING admits of the application of the principles of composition as regards the ground itself, whether plain or undulating, and of the artistic disposition of objects, whether trees, rocks, plantations, buildings, or beds of flowers. These operations constitute also the elements that are rendered available in compositions of this kind. And the disposal and arrangement of these several forms are capable of infinite variety, alike with regard to shape and colour, and light and shade. The parks and pleasure-grounds of our nobility afford excellent examples of composition in this art. Occasionally, when the character of the country admits of this being done, distant objects and points of view, and even openings for landscape scenery, may be availed of, and, as it were, introduced and embodied in the composition, whether this be effected by cutting down trees, removing buildings, or lowering part of a hill. A distant sea view or the summit of a mountain, when these are conspicuous from the garden or grounds, contributes as essentially to the general effect of the composition as does a tree or a building, or a piece of water standing within its confines. The principles of gardening may, moreover, be applied not only to the laying out of grounds which are expressly ornamental, but to the general improvement of landscape scenery, especially as regards the correction of deformities and the removal of unsightly objects which mar its natural beauties. By the addition of a few trees either to form an object in a particular locality or to introduce new tints in the foliage, by a slight alteration in the course of a rivulet, or by the construction of a cascade in a suitable spot, the whole character and composition of the scenery may be advantageously varied, and nature will be not so much changed as corrected, or rather restored.

### Saracenic Mosaic.

In Egypt Saracenic mosaic is a combination of the tessellated method with the larger proportions of sectile mosaic, but it does not exactly coincide with any of the usual European processes. In its most familiar application, as a dado about 4 feet high, running along the wall of the sanctuary of a mosque or round a principal room in a palace, it consists of upright slabs of marble of different colours and different widths, so arranged as to form a series of rectangular panels, divided and framed by narrower bands. Thus the tomb of El-Ghōry, built in 1503, has a niche inlaid with the yellow and red marbles in zigzag stripes, while the double dado on either side of it, running the whole width of the south-east wall in two lines, one high up, the other low, is of red, yellow and black marbles, arranged in square or oblong panels, the black forming the pattern and the red and yellow the centres and borders of the design. The niche of Kalaūn has black, red and yellow

mosaic, pricked out with little spots of blue tile. It is not uncommon to find fragments of tiles thus used in combination with marble or earthenware. A more usual mode of varying the monotony of the tall slabs of marble and their narrower margins is by introducing between them a border of tessellated work made of small cubes of marbles of various colours, mixed with red pottery or blue enamel, and frequently with mother-of-pearl. The contrasts between the different colours of marble, pottery and glass, and the iridescence of the mother-of-pearl, give this peculiar class of mosaic a beauty of its own which will bear comparison with any other kind of inlay.

### Statuary in Greek Temples.

Dramatic effect in their worship was ever sought by the Greeks, and it was only at special times that their divinities were unveiled at all to the general people. On such occasions every means was taken to work upon the senses. Coloured curtains tinted the light, ceremony lent its impression, and music and the chant their charm. Censers filled the air with their ambrosial vapour, and sacrificial clouds waved before the divinity, like those of his own imaginary heaven, from behind which to the entranced votary well might the mystic god almost or quite seem to breathe, frown or smile. This was a "consummation devoutly to be wished" by the priests, for then the fame of their god increased, and offerings flowed into their treasury. To effect impressions like these doubtless was it that these great statues were painted up to a key of divine life which assuredly could not have been reached by the mere natural tints of ivory and gold. It was to accomplish this that the powers of such as Phidias were thus coerced, and it was under all these devices that these magnificent idols were manufactured in those old days as the agents of polytheism and superstition. Whenever, also, the statue of the god himself in the penetralia of his own marble house was thus treated with the hues of life, doubtless its own immediate subordinates around, especially within the building, had in some degree to wear his livery. Also, when polychromy spread in addition over the exterior architecture, harmony dictated that some variation of colour should be connected also with the outside sculpture, as especially in the backgrounds of the tympana, metopes and friezes. As regards, however, the statues themselves in these situations, the variety of tint was probably confined to that obtained by difference of material, as in shields, swords, helmets and bridles of metal, and not by added surface colour, requiring constant and extensive repairs not capable of being done in secret, as was the case with the interior figures.

### Jerusalem.

No city in the world has been the theatre of such wonderful events. No city ever endured such terrible catastrophes. The first capture of Jerusalem we read of is that by Joshua, about the year of the world 2484; the second that by the people of Jebus, after the death of Joshua; the third that by David; the fourth that by Lesac, king of Egypt, who sacked the city in the reign of Rheboam, 3064 A.M.; the fifth that by Joas, king of Israel, 3210 A.M.; the sixth that by the Assyrians, in the time of Manasses, about 3261 A.M.; the seventh that by Nabuchodonosar of Babylon, in 3436 A.M.; the eighth that again by Nabuchodonosar, in 3446 A.M., when the walls were demolished, the temple, palaces and principal edifices committed to the flames; the ninth that by Antiochus Epiphanes, in 3886 A.M., when the restored city, under Zorobabel and Esdras, was again sacked; the tenth that by Judas Maccabeus, shortly after the former; the eleventh catastrophe when Pompey let loose his army on its inhabitants, in the year of Rome 690; the twelfth similar calamity when Herod of Ascalon took possession of it, but subsequently restored much of its ancient magnificence; the thirteenth that by Titus, when the Divine vengeance made the Romans the ministers of its consuming wrath, in the year of our Lord 70, and all the scourges of war, carnage and captivity, preceded by famine and pestilence, fell on the devoted city; the fourteenth signal calamity that which fell on the remnant of the Jewish people abiding in the ruins of Jerusalem, when revolting against the Romans under Barchochebas, the Jews were put to the sword by the Emperor Adrian, in the year 132, when all of their nation were interdicted the entry into the city of Elia, which Adrian had commenced rebuilding on the site of the ancient Jerusalem; the fifteenth capture was that by Chosroes II., king of Persia, in 614 A.D.; the sixteenth that by the Saracens, under the Caliph Omar, in 647 A.D.; the eighteenth that by the Greek Emperor Zim'es, some years prior to 970; the nineteenth that by the Fatimite Khalifes of Egypt, in 976; the twentieth that by the Soldjuk Turks, in 1071; the twenty-first that by the Fatimites, under Khalif al Moustali, in 1096; the twenty-second capture by the Crusaders, in 1099 A.D., when Godfrey of Boulogne was elected king of Jerusalem; the twenty-third that by the Saracens, in 1187 A.D.; the twenty-fourth by the Turks, in 1244; the twenty-fifth that by the Egyptians in our own times.

### NOTES AND COMMENTS.

WE have from time to time given information about the hardwoods of Western Australia. A pamphlet has just been issued from the Western Australian Agency, under the instructions of the Hon. H. BRUCE LEFROY, which contains the results of employing the woods by various municipalities in this country. In the long list, which ranges from Aberdeen to York, there is a surprising consensus of opinion. Occasionally it is said that a longer trial is desirable; but only in one instance is it mentioned that the paving is not quite satisfactory, and then the explanation is given that the road was in a bad condition, and that a tramway company who were bound to repair it had allowed water to enter under the new paving. In another case the reason is the use of soft woods. In the majority of cases the paving is said to be satisfactory, and sometimes it is announced that an extended use will be made of the wood. The statement has been prepared by Mr. E. T. SCAMMELL, and the object contemplated by the publication is said to be "to assist the trend of opinion in favour of wood paving for city and suburban thoroughfares, and to show the advantages of Western Australian hardwoods for engineering and other purposes, in order to promote the development of an important industry of the State of Western Australia."

THE hot weather in Paris has a surprising effect in making people discover grievances. Usually Frenchmen are indifferent to the fate of their deputies, for if by some catastrophe they were all removed, there would not be the least difficulty in appointing successors. This summer the Chamber becomes a pretext for complaining rather than the members who occupy it. It has been ascertained that there are only 467 square metres in the legislative hall, while there are 581 deputies. The space allotted to each is therefore less than what is exacted in the primary schools for children. It is a very rare spectacle to find all the representatives of the people gathered together, but the hall is condemned because it does not provide for them in the manner which is demanded by sultry weather. It is also asserted that the ventilation is most irregular. The currents of cold air are declared to be intolerable, and if a deputy should seek a refuge in any other part of the legislative palace he runs the risk of suffocation. Yet if theories could accomplish ventilation, there are enough produced every year to make French buildings habitable during all seasons of the year.

It was announced at the meeting of the London County Council on Tuesday that the arbitration with respect to the works ordered to be executed at the Lyceum Theatre had been closed. In October last the theatres committee had served notice in which forty requirements were set forth. The company of proprietors objected and the demands were investigated by Sir WILLIAM EMERSON as arbitrator. With some slight modifications, they have been all confirmed by him, and the works will therefore have to be carried out. It was also announced that upon the recommendation of the theatres committee plans were passed for a new music-hall which it is proposed to erect at the corner of King's Road and Sydney Street, Chelsea. This addition will suggest the change which is taking place with regard to theatres and other places of amusement in the Metropolis. A few years ago a proposal to erect a music-hall in that position would have been looked upon as an absurdity. The Court Theatre, which is the only one in the district, was tolerated because it adjoined a railway station; but people now demand amusements in all parts of the metropolitan area and the suburbs. It is time to put an end to the tedious journeys which were once incumbent on playgoers in London.

At the meeting of the Commons and Footpaths Preservation Society the following resolution was adopted:—"That this meeting, approving of the action taken by the Commons and Footpaths Preservation Society and kindred associations in relation to the enclosure of Stonehenge and the subsequent obstruction of the ancient ways leading thereto, expresses its conviction that no means should be spared to preserve the free access of the public to Stonehenge and the permanent preservation of the monument to

the nation." Mr. SHAW LEFEVRE, who presided, said that the Society contended that the fencing which had been erected was absolutely illegal and ought not to be permitted. The spot had been annually resorted to by large numbers of tourists and others, who had approached the monument on foot or in carriages by several clearly defined and deeply marked ways which started from and terminated in public roads, and the Society held that these were public ways and that the fence was an illegal encroachment and stoppage upon them. The question would shortly be under the consideration of the county council, and the Society were determined to fight it out. If a conclusion can be drawn from the recent inquiry, it seems to be evident that the county council have no desire to contest the rights of the owner of the property, and it is not apparent how the Commons and Footpaths Preservation Society will be allowed the privilege of becoming a combatant in place of the county authorities. It is, of course, to be regretted that the ground around the ruins is not public property and that the stones are not brought under public control, but so long as the law of property remains unaltered Stonehenge will have to be surrounded by barbed wire and approached by the route which the proprietor assigns for the use of visitors.

THE full-size model, which is larger than life, of the statue of the late Empress FRIEDRICH, the British Princess Royal, has been completed by Herr FRITZ GEHRT in Rome. The figure will be executed in marble, and, if possible, is to be completed by October 1903. The site it is to occupy is one of the most important in Berlin, for it will be in front of the Brandenburg Gate. The Empress is represented standing; she wears an Imperial robe and a crown. One hand rests on the band of the mantle crossing the breast, and the other appears to be holding the mantle back by the border. From the expression of the face the Empress might be speaking to a friend, and there is an entire absence of the haughtiness, coldness and severity usually found in such figures. By introducing the rose, shamrock and thistle for the ornamentation of the border the Empress's origin and early life are suggested. Herr GEHRT's model has given much satisfaction to the Roman sculptors who have seen it.

Too many builders take a wrong view of the importance of a tender. They do not realise that when one is accepted by the building owner or his representative, the architect, a contract is entered into which is as binding as any formal document drawn up by lawyers for the purpose. That is the view taken in the English Courts, but a judgment just given in the Scottish Courts is in the same direction. A builder in Hamilton, N.B., tendered to erect a lodging-house for a limited company for the sum of £1,333 7/6, and the offer was accepted. When the work was practically complete he discovered that in transcribing the document one item was made 152% less than it should have been. In the agreement something was said about measurement, and the builder imagined he would be paid at schedule rates. But the company took the view that if the amount had been increased by 152% plaintiff's tender would not have been the lowest, and therefore would not have been accepted. They refused to pay more than the total amount mentioned in the tender. In the Sheriffs' Court judgment was given for the plaintiff, who was held to be entitled to receive payment for the deficiency as extra work at specified rates. In the higher court before Lord Justice-Clerk, Lords YOUNG and TRAYNER, the decision of the Sheriffs' substitute was reversed, and it was held that the contract was for a lump sum, and plaintiff was not entitled to claim detailed prices. The case should therefore serve as a warning, for tenders are sometimes drawn out without realising the responsibilities which are involved in them.

## HEREFORD CATHEDRAL.

IN 1877 there was a meeting of the Royal Archæological Institute at Hereford, when the late Sir Gilbert Scott, R.A., read a paper on the history of the building and acted as cicerone. He spoke as follows:—

In giving the history of a great building, it was sometimes the case that the difficulty arose from too great an abundance of information—an *embarras de richesse* of historical facts, and such he dared say was the case when that prince among those who undertook such tasks, Professor Willis, compiled his unrivalled architectural history of Canterbury Cathedral, for in that case the most important parts of its history were so fully and accurately chronicled that Professor Willis must have found difficulty in condensing the materials, rather than in searching them out. At Hereford the case was very different, for here they found almost a nullity of historical information in regard to the building, except what was indirect and uncertain. He had to search, therefore, in every conceivable direction for such mere "waifs and strays" of history as might suggest guesses or theories, or furnish excuses for them, which it was impossible to prove or test. In writing on Hereford Cathedral, in 1841, Professor Willis said:—"It is much to be regretted that the period of no one part of this cathedral has been recorded with the exception of its front foundation." How then could he (Sir Gilbert), who was no investigator of antiquarian documents, venture to give the history of a structure the builders of which, and those who were eye-witnesses of its erection, had neglected to record what they did and what they saw? But having accepted the task he begged their consideration of the difficulty he had met with, for the very paucity of information had increased the labour of seeking it, and poor as was the result, he should be ashamed to tell them the time and labour he had devoted to the task. Their sister society, the Archæological Association, had been before them on this ground, and a paper had appeared in the Journal of that Association, written by Mr. Gordon Hills, which appeared to have so nearly exhausted the documentary information within reach, that he should, with the writer's permission, make free use of it, adding such information as he might have picked out elsewhere.

The see which now took the name of Hereford dated from very early times, and it was likely enough that there was a church of some importance there so early as Offa, the great King of Mercia, who treacherously murdered his son-in-law—or intended son-in-law—Ethelbert, King of East Anglia, somewhere thereabouts, in the year 793, for the purpose of adding his kingdom to his own. Hereford was then known by the name of Fernleigh, and the body of King Ethelbert was brought there for reinterment by a pious noble named Brithfrid. About 830 the church was rebuilt in stone by Milfrid, ruler of Mercia, in honour of the now sainted Ethelbert, and about two centuries later it was rebuilt by Bishop Athelstan, in the time of Edward the Confessor. Athelstan's cathedral was, however, but short-lived, as it was burnt in 1056 by Griffin, the Welsh king, or Bruce, who slew Leofgan, the bishop, and many of his clergy. Leofgan was succeeded by two natives of Lorraine. The first was Walter, nominated by the Confessor, and the second was Robert, appointed by the Conqueror. Robert of Lorraine, commonly called Lozinga, a corruption of Lotharingus, was consecrated in 1079, and he held the see sixteen years. He undertook the reconstruction of the cathedral, which had lain waste since the invasion by King Griffin, and he was said by William of Malmesbury to have built it of a circular form in imitation of the basilica of Aix-la-Chapelle. Now, they knew something of the church he chose for his model. It was a round or polygonal plan, imitated, as it was said, from the church of San Vitale at Ravenna, which had about the year 550 been erected by Justinian possibly in imitation of the Temple of Minerva Medica at Rome, and, more probably still, of the church of the Holy Sepulchre at Jerusalem. All those imitations were, however, but rough ones, and consisted mainly in the adoption of a round or polygonal plan. Charlemagne's church at Aix-la-Chapelle probably still existed, and was in idea very similar to those built afterwards by the Templars in rough imitation of the church of the Holy Sepulchre, which he probably had in his eye quite as much as that at Ravenna. But, however it was, the unfortunate fact remained that they had not in the Norman cathedral here at Hereford a trace or a suggestion of any of those buildings, and if Robert of Lorraine did really imitate Charles the Great's sepulchral basilica, his successors—and probably Bishop Reynelm—must have utterly obliterated his work.

Reynelm held the see from 1107 to 1115. His reputed effigy bore what might be a model of a church, and his *obit* styled him as "*fundator Ecclesie Sancti Ethelberti*," which was altered in a later hand, and he thought erroneously, to "*Hospice*." Writers on the cathedral seemed disposed either to deprive him (Reynelm) of all claim as a builder of the cathedral, or to attribute to him the completion of the work begun by Lorraine. Neither of these suppositions seemed to him (Sir Gilbert) agreeable to common sense. If Robert

of Lorraine completed his design, or if Reynelm completed it, how was it that there was no vestige of anything agreeing with William of Malmesbury's description? Instead of that they had a church in a very straightforward Norman type—apsidal, it was true, but less pronouncedly so than usual, and bearing no resemblance whatever to that at Aix-la-Chapelle. Again, the architecture was not of the earlier Norman type, but that of a more advanced period. Nor did Reynelm complete the cathedral, for they found that this was not finished until 30 years after. He (Sir Gilbert) therefore inclined to the belief that Robert of Lorraine only began the church, and that, being a German, he was proud to do honour to the Imperial basilica of his fatherland; while Reynelm, who was probably a Norman, reverted to the manner of his own country. One could not but regret that Robert's church did not still exist, as it would have been quite unique among English cathedrals. Robert was a learned man in all the wisdom of his age. He was a poet, a mathematician, and learned in the stars and their influence on human affairs, and though intimate with Remigius, the builder of Lincoln Minster, with Walstan, who built that at Worcester, and probably with the builders of Gloucester, Tewkesbury, and other vast churches then rising, he perhaps scorned to follow in their wake, and gloried in imitating the basilica which overshadowed the great hero of his own race. Unhappily, what he had said was all they knew of the building of the Norman cathedral, excepting that it was not finished by Reynelm but by his third successor Robert Bethune or Betun, who held the see from 1131 to 1148, and who having suffered, and his cathedral likewise, during the wars of King Stephen's days, lived to recover and repair the injuries incurred.

The cathedral, then, throwing Lorraine out of the calculation, took forty years in building in its Norman form. The scheme of its design was that its nave had eight bays of not unusual Norman type, supported by massive round pillars to which double shafts were attached both to the north and south. The triforium was of moderate height and good design; the clerestory was somewhat lofty. The choir—or rather the precentory, for the choir proper was beneath the central tower—was of three bays, supported by piers, which were masses of wall rather than columns, and, judging from the great plastering upon their inner faces, he agreed with Mr. Gordon Hills that it must have been vaulted, which was very unusual at that time in churches of so great a span. It terminated eastward in an apse, not formed, as was so frequent, by the swinging round of arcade, triforium, clerestory and aisles upon the altar as a centre, and uniting themselves together in semicircular continuity; but a separate and narrow structure, opening into the presbytery by an arch of moderate dimensions, over which the eastern wall returned in a square form. Each aisle also terminated in a smaller apse, and each of the three apses had its own separate roof. The transepts, of which one only remained, were of an ordinary type, without—at least the remaining one was—the apsidal chapels, which are so usual. He had elsewhere shown that three not distant monastic churches of Gloucester, Tewkesbury and Pershore followed a scheme peculiar to themselves, and displayed great originality of invention. There was no trace of that scheme at Hereford. He was not sure, however, whether the nave here was not more beautiful than that of its more original neighbours. The less lofty columns, surmounted by a well-proportioned triforium and lofty clerestory, formed a more elegant composition than the exaggerated lofty columns of Gloucester and Tewkesbury, which unduly stunted the upper storeys of the nave, though it was possible that the two ranges of aisles in the choirs of those churches, running unbroken round the apse, and the continuous aisle, with its apsidal chapels, may have produced a more pleasing effect than the non-continuous arrangement at Hereford. It mattered little, however, which looked the best. They displayed two quite different systems, each being good and nobly carried out. They saw them now but in imagination, for all those churches had been so altered that the true effect was visible in none.

He had said that the architecture of the cathedral was not early but advanced Norman. Its details in all the principal parts were decidedly rich in ornamental character, and very different from those of Remigius's work at Lincoln, at the consecration of which Lorraine would have been present had the stars been propitious; but no concurrence of stars could have rendered such details as those at Hereford possibly contemporaneous with those of the work of Remigius. He did not believe that a single stone of Robert of Lorraine's cathedral remained in its place. The great glory of the Norman cathedral at Hereford was its west front. It was probably the work of Robert de Bethune, and was consequently very late in style. He mentioned that what little Norman vaulting remained was without diagonal ribs. Possibly Bethune's work was otherwise, as that feature had become frequent in his day. At some time during the Norman period the great timber hall of the Bishop's palace and the curious double chapel of St. Margaret were erected, and St. Catherine's

which adjoined. Bethune's successor was the famous Gilbert Foliot, but though he ruled fourteen years, nothing was heard of him respecting the cathedral.

Sir Gilbert Scott then referred to the great transition in Mediaeval architecture during the time of the three successors of Bethune, and said that the next work done in the cathedral was the alteration of the east end by, probably, his fourth successor, William de Vere. De Vere reigned from 1186 to 1199, just the time of the two greatest Transitional works in the west of Britain, those of Glastonbury and St. David's, so that he was more likely to have been the promoter of the work referred to, as it displayed some marked resemblances to both the splendid structures just mentioned. The older abbey at Glastonbury had been burnt in 1186, the very year of De Vere's accession at Hereford, and the next few years were devoted to the exquisite chapel of St. Mary, now known as that of St. Joseph of Arimathea, while the last decade of the twelfth century saw the rise of the unequalled abbey church itself. The chapel was more Romanesque in its character than the church, though both alike display a refinement of detail and workmanship, and an artistic sentiment which it was impossible to excel. They were the right glorious contemporaries of De Vere's work at Hereford. The work was a very fine Transitional character, with a large supply of that rich semi-Norman decoration which characterised the two great works alluded to; yet with other beauties derived from France, and with evidence, such as the great projection of the foliage of the capital, that it was not quite so early in its style. The great alteration Sir Gilbert Scott alluded to was the entire removal of the three apses and the substitution of an eastern aisle, supplying the deficiency in the first scheme of a continuous aisle or ambulatory round the apse, and the adding to that aisle eastward a range of chapels. The point most open to objection in De Vere's alterations was the blocking-up of the fine eastern arch of the presbytery, by which the interior was deprived of its culminating feature without the substitution of anything in its stead, and the beauty of the choir was most seriously damaged. The reopening of the arch was a work of our own age, and had done much to remedy the radical defect.

They now arrived at the opening of the great thirteenth century, and here they had to start afresh with, if possible, still less direct information than they had hitherto found, though the church was rich in noble work of every part of the century, but every part was left to tell its own tale almost without even the suggestion of a date. He would pass over the mere guess that the first bishop in that century—Egidius de Bruce—built the central tower, the predecessor of that which now existed. It certainly was not the western tower as some had supposed, for no such structure existed before the fourteenth century. First of all came the noble lady chapel. This was wholly undated and unappropriated by any founder. He had come to the conclusion that the lady chapel was somewhat early in its style, because the general details were not Transitional but developed Early English, and that a marked interval must have elapsed between the closing of De Vere's work and the beginning of the lady chapel. It was true that at Lincoln and St. Albans they found developed Early English work at the very beginning of the thirteenth century, but where they had Transitional work of a very pronounced character up to the very end of the twelfth century they could hardly believe that the style at the same places suddenly changed without an interval. He would not, however, venture to assign it to any particular bishop. The bowing down of the vaulting upon the side walls, which necessitated the arcading over the windows, had an Early appearance, but not so as to class it with Transitional work. He should call it a fine design of the earlier period of Early English, though the details of the crypt seemed too late even for that. The next work was the clerestory of the presbytery. It was a specimen of very advanced Early English. The windows had what Professor Willis termed "plate tracery." It was not improbable that the original clerestory and vaulting had become damaged by the unsettling and sinking of the tower, for he could hardly otherwise account for their having gone to the expense and inconvenience of reconstructing so important a part of the building. The style and details of the clerestory were particularly elegant.

They now arrived at a yet more marked era in the architecture of the cathedral. The pointed style made its *début* in the transitional work of De Vere, and they came to the second transition—that from Early English to Decorative—or from first to middle pointed. The windows in the lady chapel were strictly lancet-shaped. Those of the north transept, to which they now came, had bar tracery—that was to say tracery pierced in all its little spandrels and corners so as not to look like a flat surface, but like the bending about of the mullions. This invention was the Magna Charta of Gothic architecture, setting it free from all the trammels of its earlier years. The history of the see about the period when this work was introduced was remarkable, and threw more perplexity than light upon the origin of the great work. It was held from 1240 to 1268 by Peter de Aquabianca, a turbulent foreigner, who came

over in the train of William, half-brother to Henry III. Aquabianca was a favourite of the king, but hated by the clergy, and he was absent from England from 1259 to 1268 in the Holy Land. In 1264 the king, passing through Hereford, found there neither bishop nor clergy, and the church in a ruinous state. He was enraged and reprimanded the bishop, and threatened that if he did not quickly return and mend his manners, he would take the temporalities into his own hands. Aquabianca returned, but only to be taken prisoner and robbed of his wealth by the insurgent barons. He was imprisoned at Ordelay, and he died in 1268. If Aquabianca built the beautiful transept it was difficult to imagine how he came to have the will or the time to do so. Yet that he had a hand in it was certain. His exquisite tomb, which they might be sure nobody would have erected but himself, bears so close a resemblance to the architecture which overshadowed it as to leave no doubt that they were by the same hand. Sir Gilbert then proceeded to point out that the tower was not all built at the same time. He concluded that the work of the lower part of the transept was carried out by the Dean and Chapter in Aquabianca's time, and that it was completed by the two succeeding episcopates, somewhere about 1288. The great faults of the design were the straight-sided form of the arches and the thinness of the details of the triforium, but with those exceptions it was an exquisite architectural design. Sir Gilbert next referred to the shrine of St. Thomas de Cantilupe, and its translation from the lady chapel to the chapel of St. John the Baptist in the aisle of the new north transept, which was partly, he dared say, built by himself, but not until then completed, remarking that they might rest satisfied that it was the *bonâ fide* shrine of St. Thomas of Hereford.

After service in the cathedral, Sir Gilbert Scott gave an historical and architectural description of the fabric. After pointing out the various parts and their features which he had referred to in his paper, which served as an illustration of his remarks, he passed on to other parts of interest in the cathedral. He pointed out as leading from the north porch into the nave a doorway of remarkable design, especially as to the crossing of its arch. It contains all the foliage of the Early English period, and the crisp natural foliage of the Early Decorated, which with other matters he thought showed its age to be about the same as the shrine of Cantilupe. It would follow, therefore, that the porch and the whole north aisle of the nave were built by Bishop Swinfield about 1288. The south aisle, though less ornate, he pointed out to be of the same age or thereabouts, and that consequently Swinfield must have built both the aisles and the nave. He described the style of the nave aisles as "Early Swinfield," and that of the presbytery aisles and the north-east transept as "Late Swinfield." In the north-east transept is the monument which he thought Swinfield in his later days erected to himself. These series of recessed monuments and effigies by which so many of his predecessors were commemorated in the walls of the presbytery aisles were probably owing to him. His death took place in 1315, and the question arose whether he had a hand in the rebuilding of the central tower, which Professor Willis seemed to have thought. He pointed out that two years after the accession of Adam de Orleton, in the year 1319, a remarkable circumstance took place in the history of the cathedral. The Dean and Chapter, supported by the Bishop of Salisbury, petitioned the Pope to sanction the appropriation by the Church of the tithes of the parishes of Shrinfield and Swallowfield, in Berkshire, on the ground that they, the Dean and Chapter, wishing in past times to restore the fabric of the church of Hereford upon an ancient foundation, which the architects and builders of the time thought firm and solid, but which architects and builders in the time of the petitioners deemed to be weak and unsafe. Consequently all the money they had expended on sumptuous work to the honour of the House of God, twenty thousand marks in all, had been to no purpose; for they were now threatened with ruin so severely that there was no remedy to be had, according to the architects and builders, unless the old fabric of the church were totally removed, and on account of that and the expense caused in connection with the canonisation of Thomas de Cantilupe, they were oppressed with various burdens of debt. The Pope replied in the following year—1320—granting them their request, and accompanied it with an assurance of his special devotion to the "blessed Thomas," whose canonisation he had so tardily granted thirty-eight years after his decease. This led them to ask what the buildings were that were constructed on the old foundations, and what on the new? He could only conceive that they were the tower and north transept; and the question suggested itself, what had they done with the money? Sir Gilbert then entered upon a series of speculations as to when and by whom the second tower was built, citing different theories. He said it was of singularly beautiful design throughout, and drew attention to the extremely light work in the upper part, which was necessitated by the great weight of the former tower sinking and crushing all the other work beneath it. Passing on to the more interesting parts of the cathedral, he remarked that the

transformation of the south-eastern chapel into a transept was probably late in the fourteenth century, when the style had much deteriorated. Not long after the beautiful chapter-house and its vestibule were erected with a great revival of artistic taste. It was believed to be 1375. The series of monuments about that time was interesting as showing the gradual passing from the Decorated to the Perpendicular style. Towards 1474 Bishop Stanbury erected his beautiful chapel adjoining the north presbytery aisle. The monuments and effigies of the various bishops were examined, and the beautiful addition made by Bishop Booth, in 1520, to the north porch was pointed out. The futile attempts at remedying the central tower were also examined. Towards the close of the last century the western tower showed such symptoms of impending failure that several architects were consulted and the worst advice accepted, and on Easter Monday, 1768, it fell. James Wyatt was called in, and to him they owed the present western façade, which Sir Gilbert Scott described as about the dulllest piece of work in any cathedral. He also pointed out the latest repairs by Mr. Cottingham since 1840. All the present arrangements of the cathedral which had been made by Sir Gilbert Scott to suit modern requirements were also pointed out by him, and in one or two instances he expressed a doubt whether he would have made such arrangements had he to do the work over again. The cloisters, which contain numerous Norman fragments of stonework, were examined, and the company, which had by this time dwindled down to only a few in number, lastly descended the crypt, and on reascending separated.

### ARCHITECTURE AND THE UNIVERSITY SYSTEM.

THE following evidence was given by Sir Thomas Drew, president of the Royal Hibernian Academy, before the Royal Commission on University Education in Ireland:—

Mr. Justice Madden: Sir Thomas Drew, you are President of the Royal Hibernian Academy?—Yes.

You are a Fellow of the Royal Institute of British Architects?—I am.

As you are aware, we are considering, at the present sittings, the question of university education with special reference to what is called technical education, and you may accept that phrase in its widest sense?—Yes.

Some evidence has been brought before us with regard to the position of the profession of architecture, and to the desirability and possibility of associating the teaching for that profession with a university course of education. We should be glad if you would give us your views on that subject.—I may say that for many years past it is a subject which has been before my mind, and I have had frequent conversations with the late Professor FitzGerald, of Trinity College, who was interested in that subject very much as to the means of the establishment of such a thing in connection with Trinity College. It has been a growing question. No such want existed when I went to serve my time, about fifty years ago, as an apprentice or pupil. The whole scope of the profession has enlarged and developed into something infinitely greater than it was then. It had no literature then, or practically none, you may say; photography had not been invented; travelling had not increased. It is the growth of all these things, and especially the growth of architectural literature, which has caused the demand for education to spring up. The weight of this demand is daily increasing, and it is a very serious question. From my point of view it is absolutely necessary that the architect of the future should have the liberal education which has now become essential for members of the profession.

You speak of "serving your time." Was the usual mode of introduction to the profession that of apprenticeship?—Yes, apprenticeship in the old crafts form, under indentures, and it still is the formal avenue to the profession, for the most part.

What evidence had the public, or have the public now, of the fact that a man who professes to be an architect has received any education, even in the sense of professional education?—There is none, except what has grown up by the necessities of the case, and has been established by the voluntary efforts of the Royal Institute of British Architects, who, there being no other means of doing it, have themselves established a series of voluntary examinations.

Perhaps you would explain to us the constitution of that body. In the first place, how long has it been in existence?—The first association of architects for any common purpose dates from 1837. In that year a charter was granted to the Royal Institute of British Architects, and two years later a charter was granted to a small body of architects in Ireland—the Institute of Architects of Ireland—which, however, did not do very much work. Indeed, for many years during my period these bodies had not been very keen to recognise the necessity for architectural education. It has been a thing of com-

paratively recent growth; but latterly it has become so pressing that the Royal Institute of British Architects during the last ten years have been exceedingly active in establishing a course of education which is entirely voluntary.

Do they give a diploma?—They do.

Is that the result of an examination?—It is the result of an examination or of an architect's known works that he has executed. For instance, I am of such an age and standing that I hold a diploma from the reputation of the works which I have executed. Of course, they would not expect an architect of known and recognised standing to undergo an examination.

Is it a teaching body?—It is not directly a teaching body but it is supplemented by a very powerful organisation in London—the Architectural Association.

What are the functions of that body?—It is a self-educating body of upwards of 1,500 of the younger members of the profession. It is encouraged and subsidised to some extent by the Royal Institute of British Architects, and it is most successful. During the last thirty years it has done a great deal in keeping classes going in subjects outside ordinary office-work. It is very largely and earnestly availed of by young men, and it is exceedingly active and useful in supplementing architectural education.

Are there lectures delivered in connection with the Association?—Yes; there are lectures delivered by outside professors and papers read on different subjects by the members, and there are demonstrations, teaching of water-colours, mineralogy, geology and such like subjects. One of the functions of the Association is practising young men in designing, which perhaps would not fall in with the routine of their ordinary office-work.

Is it your suggestion that the university should take up the work of educating men for this profession and hall-mark their attainments by a special degree or diploma?—I think it is most important that the university should take in hand the literary education of the perfect architect—not the *technique*.

Would you develop that proposition? Do you think that the technical education of an architect should be conducted in an institution apart from the university?—I think the first technical principles and the main technical part of the architect's education must always be acquired by the old crafts system, by serving an apprenticeship. Nothing will give the sense of responsibility, the practical knowledge and instinct, but actual work and actual construction. Theoretical instruction will never impress that upon students.

You would not abolish the apprenticeship system?—No.

You would supplement it?—I think the general feeling of the heads of the profession is that it should be supplemented, and, if possible, strengthened and made obligatory.

Would you develop your scheme of supplementing the apprenticeship system by the adoption of a system of university teaching?—It has been brought to my mind very much. I have had experience of a great many pupils and apprentices of my own, and this education is a crying want. In nine cases out of ten even a decent proper general education is lacking. It is peculiar, I think, to young men intended for the profession of architecture. Their parents or guardians totally misconceive the qualities and the education required. The young men have usually undergone a very ill-advised special education, which does them more harm than good, to the neglect of their general education, which is so exceedingly important to an architect.

Your idea apparently is that, concurrently with the special education acquired by apprenticeship, there should be a course of university instruction?—Yes, certainly.

What inducements would you hold out to students to devote themselves to university studies?—Well, we have already inducements with regard to these voluntary examinations of the Royal Institute of British Architects. The probationary, and some of the minor examinations, are dispensed with altogether in the case of graduates of a university. In fact, their functions as regards those probationary and minor examinations is largely a matter of necessity in dealing with the liberal education of these probationers, and is, I think, outside the proper rôle of the Institute. They have been obliged to apply tests and institute examination, and in general education, and even in ordinary, writing, spelling and so on; and it would be better if they had the assurance that the students had received a good education in some other way.

Do you think the university should give degrees or diplomas in architecture?—I think it should give some testimonium, or some minor degree. I do not think it should be confined to architects only; it might be a degree taken by other intelligent scholars in cognate subjects.

Under a curriculum which should embrace architecture in its highest sense?—Yes; architecture in its history and literature, and so forth.

In that way the practical knowledge acquired by apprenticeship in the master's studio might be supplemented by higher teaching in subjects immediately connected with architec-

ture?—Yes, subjects, for instance, that would give him a greater stimulus and interest in his profession. That is a general want.

Dr. Starkie: What would you call this degree? Would it be a degree in the fine arts?—I think it might be called a degree in architecture.

Mr. Justice Madden: To what extent do you think the candidates for such a degree should take up the ordinary arts course? Do you think they should graduate in arts?—I think they should graduate in arts, certainly.

Would there not be a difficulty then; would not that impose rather a heavy burden upon a pupil in an architect's office, if he were not only to take up the course in architecture in the university, but also concurrently the ordinary arts course?—Well, I have had instances of it. Some few of the best of my pupils took their university degree and went through the course *pari passu* with their apprenticeship.

Dr. Starkie: Did they attend a residential university?—They attended Trinity College.

Did they attend lectures?—They attended lectures sufficiently to graduate and take their degrees.

Mr. Justice Madden: There is another course which might be suggested, and that is that a candidate for a degree in architecture should follow the arts course up to a certain point?—Precisely so.

Possibly after a year of the arts course he should be allowed to specialise?—Yes.

And then his education, so far as the university is concerned, should culminate in a degree in architecture?—Yes; the degree, or certificate, or testimonial, whatever it may be called, would carry weight.

I presume your idea is that in the course of time the public would come to recognise that if they wanted architects of the highest class they should seek them amongst the holders of those degrees?—Yes, I feel very confident of that, because already, under the system of the Royal Institute of British Architects, their diploma is being looked for by the public.

We know there are a great many architects, or persons calling themselves architects, in Ireland, and some eminent and excellent architects. What proportion of the practising architects in Ireland hold the diploma of the Institute?—Well, there are comparatively very few in Ireland. There are fewer than in Manchester or Liverpool or some of those great centres. In Ireland they are a comparatively small body, but I should say that out of the twelve or fifteen architects there may be in Dublin, probably six or eight hold the diploma.

It is very hard, is it not, to say exactly what constitutes an architect?—Yes, precisely so; but during the last half-century the definition has been growing very decidedly.

You apparently would not regard as a member of the profession of architects any person who had not served an apprenticeship to a recognised architect?—No; that is our view—except under very exceptional circumstances.

The expression "qualified architect" has been used. What meaning does that convey to your mind?—It conveys to my mind a man who has served an apprenticeship, and has a certain amount of experience—a good deal of experience, in fact—of practical work, who has executed some works which proved his knowledge.

It has been suggested that a system of registration of architects should be established. For that purpose legislation would be necessary. Does that suggestion commend itself to your mind?—The question of registration has not been before us up to the present time. There have been a small minority of architects who have been for some years trying, in successive Parliaments, to promote a Bill for the registration of architects.

The great difficulty in establishing a system of registration is, that you must start with existing facts. It would be very difficult to exclude from your first register any man, no matter what his qualifications might be, who was in practice as a matter of fact, and then the public would not have the same means of distinguishing between really qualified architects and mere pretenders, as they would have if there were the hall-mark of a degree attached to a complete education in architecture?—Precisely so. There would be the hall-mark of a sufficient liberal education conveyed by that degree—a thing which no registration could convey. Registration could only touch the fringe of technical knowledge.

It must be founded on what exists as a matter of fact, and not on what ought to be?—That is so. It might be of interest to the Commission if I mentioned what I thought might be the subjects embraced by a chair of architecture.

It would be extremely useful.—I hold a very strong opinion indeed that it should keep itself clear of a technical school within the walls of the university, and that the subjects taught should be those of a general education in architecture, such as the history and literature of architecture of the world, the work of all nations, which is now a part of necessary knowledge. I think it is an exceedingly important thing that it should include in addition

a course of modern languages. A crying want of uneducated architects at the present time is a want of knowledge of French or German. It shuts them out of the literature of those countries, and is a great obstacle to learning by foreign travel. That is almost universally a very serious deficiency in young men I have had to deal with. There should also be a certain amount of theoretical teaching in architecture and jurisprudence as connected with architecture. I think it is desirable that a young lad should get some ideas into his head of the law of contracts, the common law relating to building and of the course of decisions in law, of arbitrations and many other things, which I am sure your lordship will understand touch the fringe of the architect's practice. A young man does not acquire a knowledge of these things during his apprenticeship; he must pick up that knowledge for himself by experience. Again, I think the chair might deal very well with the new or modern relations of architecture to public health and sanitation. There are many kinds of knowledge that an architect should possess in that direction. For instance, in regard to modern medical requirements for hospitals, asylums for the insane and that class of institutions, as to which he should have a general knowledge, which, as a young man, he usually has not. Then there is the problem of the housing of the poor; a man might acquire ideas upon that social question before he came to practical building. Then, of course, as we know, one of the great things necessary, and which we should try to get for the young architect, is the power of graphic expression, both by writing and drawing. I think a chair of architecture might do much to develop the literary ability and descriptive power which is not done in practice in the office of a master. I think, too, that the student's interest should be aroused in the fine arts and crafts of all countries, which are ancillary to architecture. He is usually deficient, too, in such things as elementary statics and dynamics, and he has no opportunity of acquiring the knowledge afterwards. Then such subjects as elementary geology and mineralogy he requires some information about, which information he does not obtain in his master's office. That observation applies also to chemistry. In such subjects as these, which he has not the opportunity of learning in his practical apprenticeship, it would be most desirable if his interest were aroused, and knowledge imparted by lectures in a course in architecture.

Most Rev. Dr. Healy: I am not qualified to go into detail in regard to some of these matters, but perhaps you will allow me to ask you one or two questions upon points of general and historical interest. Is there any such thing as an Irish Institute of Architects as distinguished from the Royal Institute of British Architects?—That requires two answers. There is an old institution, of which I have been president for fifteen years—the Royal Institute of Architects—which has been chartered since 1839.

Does that exist still?—Yes, and it is in an exceedingly healthy state, and a system of instruction has been established in alliance with the Royal Institute of British Architects. Some eight or ten great centres have become allied societies, practically blending them in their public acts.

You are aware that during the period of the Irish Romanesque, before the Anglo-Norman invasion, we had a very distinctive school of Irish architecture, had we not?—Yes; a most interesting school.

And that school left some beautiful work behind it, did it not?—Yes.

Of which we have traces in evidence still. That did not come across the Channel from England or Scotland, did it?—No. That is one of the very interesting subjects which might be taken up by the chair of architecture, from the historical and ethnological view.

From that view, of course, that would be most interesting; but what I want to ascertain from you is, do you perceive at present any tendency to the development of a national school of architecture as distinguished from British architecture in Ireland?—I am afraid not; I am afraid the reverse.

Do you think that your suggestions here, if they were adopted—and I hope they will be—would tend in any way to the development of a national school of Irish architecture?—Oh, I think so, enormously; they would get it out of the groove it is in. I have a strong opinion that architecture in Ireland is in a groove, and not a progressive one.

Mr. Justice Madden: By being in a groove, I suppose you mean that it is mere imitation?—Mere imitation at present. I think in Ireland that is rather a weak point. It cannot be said that it is a fault, because it has arisen from the want of means for education.

Most Rev. Dr. Healy: But if we had this scientific and artistic education to which you refer, do you think it would tend to the creation of a national school of Irish architecture?—Certainly.

And one might hope possibly would lead in the future to more beautiful work being executed?—No doubt. And I should say that our establishment of voluntary societies for

self-education has already effected a great deal by unaided effort.

Professor Lorrain Smith: How far would these subjects which you have suggested as forming subjects of study for the degree in architecture require new departments in a university or university college?—I do not exactly know what would be the departments that would be called for. There would be a professor of architecture, I suppose.

Geology, for example, would not require a new department, or chemistry, or dynamics, or modern languages?—No; you would need no additional provision for those.

Then as to the subject of jurisprudence: how would you suggest that provision should be made for that?—Well, that might be done by occasional lectures. Perhaps a member of the Bar might be got to come in and give them.

It might be tacked on to the faculty of law?—Yes.

Then as to public health?—That might be supplied by the medical faculty.

Then with regard to the housing of the poor, that might be dealt with by the chair of economics, I suppose?—By the professor himself, or by some one well versed in the subject—probably an architect.

Then as to the literature of architecture. That might be in connection with the chair of English and modern literature?—Well, I meant to convey more the literature of architecture.

Then you referred to the subject of lucid expression in English?—That would come, in a great measure, under his general education, as a graduate in arts.

Then "fine arts and crafts": I think, probably, that would be a new department?—It would; perhaps an occasional outsider would be brought in to lecture in that.

Could that be united with the architecture of the world?—Yes, it would be part of that.

Those would come under the same department?—Yes.

So that practically you ask for the establishment of one new department and the rearrangement of certain others?—Yes. I think it would be desirable, too, that there should be encouragement, at all events, to take up in the architectural course drawing, not technical drawing, but as a fine art, to get a certificate from the school of art; not architectural drawing—drawing from the life or from the round.

How far would this examination correspond with the present examination for the membership of the Institute?—It would correspond identically, I think. I can hand in to the Commission a synopsis of their examination.\*

I mean, would the Institute allow a substantial part of that examination as a qualification for membership? They do already; I have it with me in print.

That would be an inducement?—It is an inducement. They welcome a graduate in arts from the university, and omit the probationer's examination.

Another point is this: Would the period of apprenticeship be curtailed if a student had passed this examination?—Well, speaking for myself, and perhaps some others, I think that that does not arise in this way; we are of opinion that the apprenticeship has been already far too much curtailed.

Mr. Justice Madden: What is the existing term of apprenticeship?—Sometimes only three years, sometimes four years. In my opinion four years should be the minimum, and it would be much better for a man that he should serve five years.

Professor Lorrain Smith: Is there any objection among architects, such as merchants and manufacturers have, to letting men attend courses at a university at the same time as they are serving their apprenticeship?—No, I think not. I know I have never offered any opposition. Of course attendance at lectures takes a man a little from his work, but I have not found it to be serious. I have always encouraged it.

Do you think that that course would be adopted by the profession?—I think so.

Because there seems to be a very strong opinion amongst manufacturers, for example, against allowing anyone, while serving his apprenticeship, to be at the same time attending lectures?—Well, there are objections certainly, and there are some inconveniences, but my own feeling is that they are outweighed by the advantages.

You would advocate day teaching?—Yes, to such an extent as can be allowed.

A compromise is arranged very often by the technical students going to evening classes?—Yes, that course would be very desirable. Evening classes should be established and used so as to draw a man as little as possible from his daily pursuits.

I want your opinion on that point. One can hardly regard evening classes as of the same standard as day classes, and in arranging to give a degree which involves a liberal education one would be inclined to arrange for day study if possible?—Well, my feeling would be that, suppose I had an apprentice,

he would be withdrawn for a portion of the day once or twice a week to attend lectures, and then, when the time came for his examination for the degree, he should have sufficient time allowed him in the day to sit for the examination. But endeavour should be made to avoid interfering with the daily routine of business as much as possible.

You do not think there would be any advantage to deduct some time from his apprenticeship?—I do not think that would be an advantage. It is seriously felt already that his practical work is too limited. As a rule, it is necessary to raise the enthusiasm and interest of the student in the great profession he has adopted, but I think he should occasionally go into the outer air from his office and hear lectures on the broader view of his profession—that would do him good.

Do you think your opinion would be adopted by the other heads of the profession?—Well, I know the Royal Institute of British Architects will go on with their final examination and diploma, and probably get it legalised.

And probably get it legalised?—And probably get it legalised in time, and it will be the body to confer the complete diploma of master of architecture.

Dr. Starkie: In your summary you hold out the hope that this untechnical course in architecture might be shared by students in other faculties as a subject of educative interest and usefulness. Is it your idea that those students who do not intend to take up the profession should also qualify for a degree in architecture?—I think that would be a question for the university, whether they thought that students who were not graduating in architecture should be excluded from these lectures.

What I was thinking was, that if the history of architecture is to be made an element of general education it ought to be combined with the study of the history of cognate subjects like sculpture and painting.—Those should be part of the architectural course.

Why in that case call it a course in architecture, and not "fine arts"? In Cambridge there is a professor of the fine arts, and so also there is at Oxford?—Architecture I regard as the mother of all arts, and the most inclusive.

Architecture in the time of the Greeks was a term much broader in its significance than at present?—You need not go back to the time of the Greeks, or of the Georges, because architecture has grown to a position it never held in those days.

But at present is not architecture looked upon as having a very definite significance—as excluding, you might say, the study of painting?—He would be a very ill-educated architect now who was not acquainted with the history of painting and of sculpture too.

No doubt; but would you have any objection to the degree being called a degree in the fine arts, for which students whose only aim was general culture should compete?—Yes, I would. I look at it exclusively from the architectural point of view, and to be a thing of value to the students, it should be a diploma or testimonium, or whatever it may be called, in architecture from the university.

I see from your synopsis that you look forward to a final diploma which would be given to persons qualified to be called "Masters in Architecture"?—Yes; that is as well as I could express it.

You have already provided for the technical training of the architect in his apprenticeship?—Yes.

Do you not think that a degree in the fine arts would be of equal value to the architect, if it were known that the course in fine arts included the history of the architecture of the world, in addition to the history of sculpture and painting?—Well, it is of the public I am thinking—its effect upon the public and the knowledge it conveys to the public. The name, I think, is important. A diploma in the fine arts from the university would not convey to the public that which I think we want to have conveyed.

Would there not be a danger, if there was a degree in architecture, of that degree being considered as of more importance than your diploma, which, of course, implies a good deal more?—There should be the greatest care taken that it did not convey that, or anything approaching it.

Usually in Germany and in England a diploma is not considered as valuable as a degree?—It would be simply this, that whatever certificate the man brought from the university would be accepted by the public as a guarantee that he was an educated man outside the technical part of his craft. It would be very important that it should convey no more than that.

Would you be in favour, say, of similar degrees being given in sculpture and painting?—No, I look upon the history of sculpture and painting, as taught by an architectural chair, as quite a kind of by-issue—that the men should have some knowledge of those subjects as forming part of the arts ancillary to architecture. He should not be ignorant of the sculpture and painting of past days.

In some part of your evidence you stated that a great part of the narrowness of the education of architects at present was

\* "The Kalendar of the Royal Institute of British Architects, 1901-2," p. 254.

due to their ignorance of foreign languages, and to the fact that they had not travelled sufficiently. Would you be in favour of the university founding travelling scholarships in architecture?—It would be an admirable thing. We have already done it to a large extent ourselves. We have a number of travelling scholarships to be competed for annually.

Professor Dickey: Would you consider it essential or advisable that an architect should have some knowledge of engineering?—He should, to a certain extent. I can speak with confidence as to that, because I was apprenticed to a civil engineer myself, and in early life had some experience of civil engineering. In my opinion he ought to have a certain amount of knowledge of that subject.

How much should he know—do you mean simply the principles of engineering?—Well, it is a more technical matter; he should learn that in a technical way. He should understand, in common with engineering, iron construction, the calculation of strains on iron, and many of those questions in statics and dynamics which are more essentially connected with engineering.

That might be learnt in the university, I suppose?—I do not think that is very important. It is a subject which he could to a great extent learn from books.

It would not be part of his technical education?—No; I do not think it is worth dwelling on. If he has any use of it in his profession he will be able to master it.

You would not think it necessary to include it in that university course?—No; I would keep it distinctly apart. The two professions have such different aims that to combine them would be only mischievous.

I suppose that practical and theoretical education ought to go hand in hand?—They ought, but in some subjects mere theoretical instruction is, I think, mischievous, and worse than useless.

Take a university consisting of a federation of colleges. Take Belfast, for instance. A young man studying for the profession of an architect in Belfast should have the facilities offered him in Belfast for obtaining the university education necessary?—Yes, it is very desirable that that should be so.

That would mean a chair of architecture, not for the university only, but for each individual college?—I think it would be very desirable indeed, so long as it was always understood that the student was not in any way qualifying as a practical architect, but merely hall-marking his education in a general way.

Are you familiar with the course of study required of students by the Intermediate Education Board?—No, I cannot say that I am. I have taken a general interest in the intermediate education question, but have not studied the details very much.

But you have a general idea of the course?—I have a general idea of the course.

Would it not be possible for a student who had gone through all the stages of the Intermediate Education Board to enter a university, and immediately without any further course in arts, specialise for architecture?—Do you mean with respect to his taking a degree in arts?

With a view to taking a degree in architecture. Would it not be possible for him to specialise directly, without being asked to pursue any further course in arts?—That does not touch my point exactly. Our anxiety is that the future architect should, if possible, get a degree as the hall-mark of his education, wherever it is obtained.

As well as in architecture?—Architecture is looked upon as an additional and special subject. But the deficiency that is met with, and is every day met with more and more, is the want of a good general education outside the technical education. The degree in arts would raise the status of the architect in the community.

Mr. Justice Madden: You contemplate your students, in order to be fully equipped, taking a degree in arts. If a new degree were instituted—a degree in architecture—either of two courses might be adopted:—A student might take that degree along with a degree in arts; that is to say, go in for two courses. But we cannot shut our eyes to the fact that that would be rather a heavy burden, particularly if, at the same time, he were going through a course of practical training in an architect's office. But supposing the degree in arts could be obtained by taking up as one of the subjects the course in architecture which you suggest, would that meet your views?—I think it would be for the wisdom of the university to fix that. I think it would.

What you desire is this. You want to attain a high-standard education embracing an arts course and also a certain degree of specialisation in the department of fine arts connected with architecture?—I think that would be very desirable.

You would regard it rather as a matter for the university to determine how that should be brought about, but it might be brought about by allowing arts students to specialise towards the end of their course in architecture and cognate subjects, taking those subjects up as a constituent portion of the curri-

culum for the arts degree?—That is what I have in my mind. You have put it in a better way, but that is really what has been floating before my mind.

### MANCHESTER ROYAL INFIRMARY.

A SPECIAL general meeting of the trustees of the Manchester Royal Infirmary will be held in the Memorial Hall, Albert Square, on Tuesday, July 22, at eleven o'clock, to receive, consider, and if approved to adopt the report of the Board of Management recommending that the Royal Infirmary be rebuilt upon the present site in accordance with plans submitted, and to authorise the Board to proceed with the work of reconstruction in conformity with the terms of such resolutions as may be passed.

In the report of the Board of Management to the trustees upon the question of rebuilding the Infirmary, it is stated that the committee appointed by the Board have devoted much time and given a great deal of consideration to obtaining suitable plans and estimates for a new building. Particulars of the accommodation required were prepared, in concert with the honorary medical staff, and instructions given to Messrs. John W. Simpson & E. J. Milner Allen, architects, of London—the successful competitors upon the last occasion—to prepare fresh plans for an infirmary to contain 450 beds, without any restriction as to the form of construction, but with the proviso that they were to show how the requisite accommodation could be best provided without seriously reducing (except for temporary buildings during reconstruction) the present extent of vacant land. The Board are now glad to report that the architects have submitted plans, upon the pavilion principle, for a new Infirmary to contain 452 beds without materially encroaching upon the land now vacant. The area of land within the railings which is uncovered by buildings amounts to 13,440 square yards; the proposed new buildings will diminish this existing open space by 846 square yards, or about 6 per cent. only. Accommodation is provided for 179 medical and 273 surgical patients (including, if required, twenty beds for Jewish patients), or a total of 452, as compared with 292 beds now available (viz. 121 for medical and 171 for surgical cases), and for 230 officers, nurses and servants, an increase of 101 on the present staff. Provision has also been made for a splendid out-patients' department, five operating theatres, clinical and bacteriological laboratories, and for an accident department. The materials for the exterior are red brick and stone facings with green-slatted roofs.

The architects estimate that the cost will be approximately 200,000. This sum includes the expense of providing temporary accommodation during the process of reconstruction, but is exclusive of the cost of furniture and fittings, and they state that the time occupied in reconstruction will extend over a period of about six years.

The following is the architects' general description of the buildings:—In this new design the area occupied by buildings is practically the same as that of the selected plans submitted by us in the competition of 1896, though the scheme has been entirely recast; but it may be well to point out that, while the area to be built on is only slightly in excess of that occupied by the Infirmary, the proposed new buildings are so planned that some part of the space at present vacant will be occupied. Against this, however, there remains the compensatory space contained within the open courtyard, which would be readily apparent to anyone viewing the structure from Piccadilly. There is a net difference of 150 yards super additional of building, but since the pathological block containing 261 yards super is now kept nearly level with the ground line, there is practically a gain of 111 yards super of open space. The actual figures are given for comparison:—

1. Total area of site, as given on the block plan issued by the committee, 19,580 yards superficial. Area of existing buildings, as indicated by hatched lines on the said block plan, including porticoes, 6,140 yards superficial. Open space, 13,440 yards superficial.

2. Area of buildings shown on the selected competition design, 6,836 yards superficial.

3. Area of buildings shown on revised design, 6,725 yards. Add pathological block, 261 yards—6,986 yards superficial.

The actual vacant ground is thus 12,594 yards in the revised design, as against 12,744 in that submitted in competition and 13,440 yards now existing. The frontage to Piccadilly has, however, been greatly reduced, thus bringing the vacant ground into the same relative position to the buildings as it now occupies. The actual frontage occupied by new buildings is 103 yards, consisting of a central block of 58 yards with wing blocks of 22½ yards each, separated from the central building by open spaces of 12 yards each; whereas the total frontage of the plan previously approved was 184 yards, and that of the existing Infirmary front is 79 yards. It is hardly necessary to point out the great advantage gained by having three blocks instead of one long continuous line of building. In the revised

design provision is made for 452 patients, an addition of twenty-four to the selected plan. Schedules are furnished showing how the patients are warded and classified.

The following schedule shows the distribution of patients on various floors of the new building :—

	Ground Floor.		1st Floor.		2nd Floor.		3rd Floor.		4th Floor.		
	Rect.	Cir.	Rect.	Cir.	Rect.	Cir.	Rect.	Cir.	Rect.	Cir.	
Surgical—Men	8	20	6	20	2	20	2	20	58	20	176
Do. Women	3	20	12	20	2	20	—	20	—	—	97
	Total										273
Medical—Men	9	—	28	—	28	—	28	—	2	20	115
Do. Women	4	—	4	—	28	—	28	—	—	—	64
	Total										179

A second schedule shows the warding of surgical and medical cases respectively, and a third schedule gives the accommodation in the present Infirmary—102 beds for men and 72 for women in the surgical department, and 60 beds for men and 58 for women on the medical side; total surgical 174, total medical 118; grand total 292.

Accommodation is now provided for 162 nurses and servants, as against 133 in the plan first selected. Although the frontage to Piccadilly unbuilt upon has thus been shortened and the accommodation increased, a further study of the design has enabled us to materially reduce the heights of the main buildings from that first designed. Thus the wall height of the rectangular ward blocks, though containing the same number of storeys (five) as in the competition design, have been reduced from 82 feet, the original height from ground to top of balustrade, to 66 feet. The circular pavilions, which were originally of four storeys only, have now five storeys, without additional (indeed, with slightly diminished) height. This result has been achieved by designing a new type of ward for the top floors. The general section is that of a barred vaulted roof with continuous top light, but with sufficient windows to afford outlook for patients and do away with the impression of confinement which a windowless apartment is apt to convey. The lighting of these wards will, of course, be unexceptionable from a medical point of view. Indeed, the new Victoria Infirmary at Belfast is planned for solely top-lighted wards.

The lessening of the heights has materially helped us in considering the question of adjoining buildings overlooking the site. For detailed descriptions of the various departments we refer you to the printed description which accompanied the selected plans. These remain much as therein described, save for their altered positions in the new design. The operating theatres are, however, now increased to five in number, one being placed in connection with each group of wards, with its proper annexes for anaesthetics, &c. A clinical laboratory, with X-ray and photographic rooms, has also been added to the accommodation, also two rooms for bacteriological research. The lecture theatre has been increased in size, and now accommodates 250 students. A separate department has been arranged for the reception of Hebrew patients, if such should be required. The accident department has been entirely replanned from the competition scheme and is now greatly improved. It forms an entirely distinct group, but is yet in immediate touch with the hospital wards, the medical and surgical officers' apartments and the entrance.

The elevations, to which in the competition design we had been unable to devote the study we should have desired owing to shortness of time, have now been entirely redesigned with a view to more adequately adorning so splendid a site. The materials proposed for the exterior are red brick for the facings with stone dressings and green-slatted roofs.

The intention is to rebuild in sections, so as to interfere as little as possible with the work of the institution during reconstruction. It is proposed by the first contract, which will occupy fifteen months, to pull down the present nurses' house and erect new east and west circular pavilions, out-patients' department and pathological block. The 174 surgical patients (men and women) will then be transferred to the new buildings (the men occupying the west wing and top floor of the east wing and the women the other floors of the east wing), thus emptying the following wards :—Byrom, Gibson, Alexandra, Jenny Lind, Alice, Hall, Humphrey Nichols, Dauntsey-Hulme, Peel, Treasurer's, Derby, Hatton, Mosley, Albert and Thomas Rose. The medical patients (men and women) will be accommodated in the following vacant wards :—Men (64) in Jenny Lind, Alexandra, Alice, Dauntsey-Hulme, and Peel. Women (58) in Byrom, Gibson, Hall, Humphrey Nichols, Albert and Thomas Rose, the last named being extended to hold nineteen beds as the present Mosley ward and the Gibson ward enlarged to the same size as the Jenny Lind, thus giving 122 beds in place of the present 118. In addition, the Louise ward of three beds is retained for isolation cases. (The Gibson ward loses two beds.) Accommodation for the nurses will be provided in temporary buildings in the grounds until the completion of the last contract. The Treasurer's ward will be

temporarily divided into six rooms of similar size to those in present east wing for resident medical officers' bedroom and sitting-room, two house physicians' bedrooms and two house surgeons' bedrooms. The Derby ward will be similarly converted into six rooms for women servants (five bedrooms) and housekeeper's bedroom. The general superintendent will be accommodated in the Hatton ward, and the Mosley ward will be fitted up as five bedrooms for women servants and seamstress's room. The library will be transferred temporarily to the physician's room, the present house surgeon's bedroom, No. 19, being extended by taking in the corridor adjoining, and utilised as resident officers' dining-room, with waitress's pantry and service next it. The displaced house surgeon will be transferred to the treasurer's room, and the collection of models placed in the unused central entrance corridor opposite. The billiard-room will be vacated and used as servants' dining and day-room, and the housekeeper's office removed to the present linen store. The sisters' room between Treasurer's and Derby wards will be converted into a linen store, the kitchen next Hatton ward into a deceased patients' clothes store, and the Hall ward into a mattress and bed store. The foregoing changes clear the east wing of the old building, which may now be pulled down. The reason for first attacking the east wing is that the accident department is thereby left intact for the present. All rooms not specifically mentioned are retained for their present uses. The small (two-bed) wards on top floor of each block in new building to be used as temporary operating-rooms. Temporary connections from the old buildings to the new will be formed on the ground floor, with elevators adjoining the staircases. These elevators will be re-erected in their permanent positions at end of the second contract.

The second contract, which is expected to occupy 24 months, will include pulling-down the present out-patients' department, laundry, mortuary and P.M., and east wing of main building, and building the new east rectangular ward block and the administrative block. The medical patients (men and women) will be transferred to the new east pavilion, the women occupying the first and second floors, and the men the third and fourth floors, thus freeing the old building entirely of patients. The Turkish bath, foreman and carpenter's shop, and general box-room in the basement will be divided into cubicles to form temporary apartments for the porters. The women's dayroom will be used as a temporary chapel. The staff now take up their proper quarters in the new administrative building.

The third contract will, it is expected, be completed in 30 months. Under it will be taken down the present kitchen block and the front portion of the main building, and the casualty department and the approaches from the east side will be built. The casualty department will then remove to its new quarters. The rest of the old buildings will be taken down and the new west rectangular block and nurses' home will be built, thus completing the new infirmary.

The principle of the foregoing scheme, the architects explain, is the transference of the patients to the new buildings at the earliest possible date, and the use of the old buildings for administrative purposes till the moment of their demolition. The working of the hospital will be undisturbed during rebuilding.

The estimate of cost is based on a computation of the cubical contents of the buildings, and is therefore necessarily approximate only. It has, however, been very carefully calculated, and we believe represents within a reasonably small percentage the amounts for which tenders by responsible contractors can be obtained for the several contracts, based on current prices. Some provision, however, must be allowed for the cost of temporary connections, drainage and alterations to the existing buildings during the erection of the new infirmary. It is not possible to ascertain this amount definitely at present, but it would, in our opinion, be prudent to allocate a sum of 8,000*l.* for the purpose, spread over the three contracts.

We estimate the cost as follows :—First contract : Pulling-down present nurses' home and erecting new east and west circular pavilions, out-patients' department, septic wards and temporary nurses' homes, 46,319*l.* Second contract : Pulling-down present out-patients' laundry, mortuary, pathological department and east wing of main building, and erecting east rectangular ward block and administrative block, 71,364*l.* Third contract : Pulling-down remainder of old buildings and completing the new infirmary, 61,139*l.* Total, 178,822*l.* Add provisional sum as above mentioned, 8,000*l.*; grand total, 186,822*l.* The cost of pulling-down is set against the value of the materials obtained thereby. The estimate is exclusive of furniture or fittings.

The Site of the circus in the Champs-Élysées is likely to be utilised for the erection of a large concert hall, which will be designed by M. Umbdenstock.

### NEWCASTLE SOCIETY OF ANTIQUARIES.

A PARTY of members of the Society of Antiquaries of Newcastle-upon-Tyne paid a two days' visit to Falkirk and district last week. Under the guidance of Mr. J. R. MacLukie, F.S.A. (Scot.), they inspected the many places of historic and antiquarian interest in the vicinity. On the Tuesday the party visited Falkirk parish church and churchyard, where the different interesting monuments were pointed out to them, subsequently driving to Callendar House, where, by permission of Mr. Forbes of Callendar, they were shown over the fine country seat by the factor, Mr. Wallace, and also taken through the pretty grounds surrounding. Many objects of antiquarian interest were seen in the house. There was pointed out to them in the grounds by Mr. MacLukie a deep fosse of the Roman wall and of the kame which runs through the policies. A visit was also paid to South Bantaskine, where the site of the Battle of Falkirk of 1746 was viewed. The following day the party were conveyed to the "broch" of Tappock, situated on the summit of the Torwood, about 5 miles north-west of Falkirk, the ancient haven of refuge being described to the party by Mr. Thomas Ross, architect, F.S.A. (Scot.), Edinburgh. The old castle of Torwoodhead, built in 1566 by the descendants of the Baillies of Castlecary, was then inspected. The hills of Dunipace also received attention, and the party had the privilege of visiting Dunipace House, the residence of Mr. Harvey Brown, the well-known authority on natural history. The company then drove to the Roman fort at Castlecary, where excavations are at present being made by the Society of Antiquaries of Scotland. Here the English visitors were joined by a party of antiquarians from Edinburgh, composed of Bishop Dowden, Colonel M'Hardy, C.B., the Hon. John Abercrombie, Dr. Watson, Mr. Ross and Mr. Cunningham, C.E., F.S.A. (Scot.), secretary to the Society of Antiquaries. A description of the interesting Roman remains was given by Mr. Cunningham. The romantic old castle in the vicinity owned by the Earl of Zetland also received a passing visit, after which the party drove by the "via militaris" along the Antonine wall to Rough Castle, where the part of the Roman wall in that vicinity was carefully inspected, as well as the ancient fort itself. Wallside and Tay a Valla were taken on the homeward journey, the party being entertained by Mr. Orr of Kinnaird. Falkirk was reached in the evening, and after dinner in the Crown hotel the party left for Newcastle.

### BRISTOL AND GLOUCESTERSHIRE ARCHÆOLOGICAL SOCIETY.

THE annual summer meeting of the members of this Society was opened at Tewkesbury on Tuesday. At noon the mayor (Councillor T. W. Moore), the Corporation and officials gave the Society a formal reception at the town hall. The Mayor, on behalf of the Corporation and inhabitants, cordially welcomed the Society to the royal and ancient borough of Tewkesbury. The Society had performed, and was still performing, a duty most interesting and important to students of archæology in the country. In the course of his address of welcome the Mayor referred to the ancient abbey with its massive grandeur, which the Corporation of Tewkesbury preserved from destruction by purchasing from King Henry VIII. in the year 1540. He also spoke of the town's possession of examples of Mediæval domestic architecture. The old bridge across the river Avon, known as King John's Bridge—the original of which, built by King John, had no doubt gone in the course of age—was of great antiquity. Queen Margaret's Camp could be seen and the memorable meadow where the decisive battle of Tewkesbury was fought and where fell the flower of the Lancastrian party. A recent discovery had been made in a small house of what was supposed to be the ruins of a portion of the crypt of the Church of St. Mary, which was 200 years older than the abbey, and this would be open to the inspection of the Society. The Mayor, having referred to other features of archæological interest in the town and neighbourhood, ventured to say that the old borough of Tewkesbury afforded more abundant interests for illustration and disquisition than almost any other place in the kingdom.

The general meeting of the Society was then proceeded with, Sir Brook Kay, Bart., being in the chair until the Earl of Gainsborough arrived. The report of the council was read by Canon Bazeley; it stated that the membership numbered 501, and there was a balance in hand of 254*l.* 5*s.* 10*d.*, besides 221*l.* 14*s.* 4*d.* in the bank on deposit account and 632*l.* 3*s.* 8*d.* invested in Consols.

The Earl of Gainsborough, in taking the chair, congratulated the Society upon the number of members present. In responding to a vote of thanks for his services as President during the past year, and for his hospitality on the visit of the Society to Chipping Campden, he spoke of the natural beauty of the Cotswold country, its picturesque scenery, historical associations and beautiful buildings.

The Rev. E. R. Dowdeswell thanked the Society for honouring him with the position of president.

After lunch the Society made a tour of the abbey, and afterwards took tea in the grounds of the vicarage, by the invitation of the vicar and Mrs. Wardell Yerburch. The site of Holme Castle and the old houses were inspected under the guidance of local gentlemen, and at a conversazione held at the town hall in the evening, by the invitation of the Mayor and Mayoress, the Rev. E. R. Dowdeswell gave his presidential address upon the history of Tewkesbury Abbey.

### GENERAL.

The Council of the University College of South Wales and Monmouthshire have appointed a building committee to obtain plans of college buildings to be erected on a site given by the Cardiff Corporation in Cathays Park.

The Artistic Society of French Amateurs will make an excursion to Bruges for the purpose of viewing the exhibition of pictures which is being held in that city. The visit will extend from July 20 to July 30.

The Oxford City Council have had under discussion the judgment recently given by the Recorder, the Hon. A. Lyttelton, in regard to the rating appeals by the University of ten of the colleges and the Clarendon Press. It was ultimately resolved to ask the Recorder to state a case for the High Court.

The French Government have purchased *The Justice of Christ*, which is one of the most remarkable of the late M. Benjamin-Constant's works.

An Exhibition of the arts as applied to industry is to be held next year in St. Petersburg. French work will be largely represented in it.

The Tramway Lines in Berlin are now worked by electric power without exception. There is not one on which horse traction is employed.

The Lord Chancellor has come to the conclusion that no useful purpose will be served by an independent inquiry into the working in London during the past four years of the system of registration of title to land under the Land Transfer Act, 1897.

An Appeal has been made for 20,000*l.* in order to build a new cathedral for Pretoria.

The Receipts from visitors to the Salon have amounted this year to 328,000 francs, being the largest sum received for admissions since 1888. The rival society has also obtained an increase of 15,000 francs over last year's receipts. Neither exhibition attained average merit in its works.

The Norfolk County Council used 22,322 tons of granite on its roads last year, and most of it was derived from Belgium owing to the low cost of carriage, which enabled it to compete successfully with English. The average cost of the foreign granite delivered at the various places required was 11*s.* 1*d.* per ton.

An Exhibition of examples from the French national pottery at Sèvres will shortly be open in the Grand Palais of the Champs Elysées.

Mr. Donald A. MacAlister, F.G.S., has been appointed geologist to His Majesty's Government, to undertake special investigation in the mining districts of Cornwall.

Mr. W. F. Faviell, M.I.C.E., who died on Thursday in last week, was the contractor who, in conjunction with his partner, Mr. Fowler, constructed the first railway in India, from Bombay up the Ghauts towards Poona. He also carried out the line between Colombo and Kandy. His last contract was in South Africa in 1877, where he undertook to extend the Port Elizabeth railway into the interior in the direction of Cradock and of Graaf Reinet.

On Wednesday last the only daughter of Mr. Thos. Dinwiddy, F.R.I.B.A., F.S.I., of Blackheath and Walmer, was married at Greenwich to Mr. Stanton Freeland Card, R.N., B.A. The Bishop of Southwark, with the vicar and other clergy, officiated. A reception was afterwards held at the Manor House, Blackheath, and attended by 250 guests. The presents were numerous and costly, numbering over 180.

Mr. Ernest Day, F.R.I.B.A., architect and surveyor, of 5 Foregate Street, Worcester, is removing to more convenient offices at 6 Sansome Place, Worcester.

M. G. Dubufe, painter, will prepare the report on the works of contemporary artists at the Paris Universal Exposition of 1900 under the direction of M. Gérôme.

A Memorial Statue of Mr. E. Onslow Ford, R.A., provided by public subscription, is to be placed at the junction of Grove End Road and Abbey Road, St. John's Wood. An influential committee have the project in hand, and the care and maintenance of the memorial after completion will be entrusted to the Marylebone Borough Council.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**AYLESBURY.**—July 19.—Designs and estimates are invited for supplying and erecting a stone monument, 50 feet high, on Coombe Hill, near Aylesbury. Mr. R. J. Thomas, county surveyor, County Hall, Aylesbury.

**BERMONDSEY.**—Sept. 16.—Designs are invited for artisans dwellings to be erected on land at Rotherhithe, within the borough of Bermondsey, and known as the Fulford Street area. Premiums of 100*l.*, 60*l.* and 40*l.* will be awarded. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**BIDEFORD.**—Sept. 25.—The Town Council of Bideford are about to erect municipal offices and a public library upon a site opposite the west end of the Long Bridge, Bideford, and they invite designs for the proposed buildings. Premiums of 30*l.*, 15*l.* and 10*l.* respectively are offered for the designs which shall be placed by the Council first, second and third in order of merit. Designs and descriptions, &c., are to be delivered to Mr. Wm. B. Seldon, town clerk, 18 The Quay, Bideford.

**CLACTON-ON-SEA.**—July 26.—Plans are invited for erection of a new school in Holland Road, Great Clacton, for 500 children, showing enlargement for an extra 300 children. Mr. Charles E. White, clerk, Wellesley Road, Clacton-on-Sea.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford S.E.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**SOUTHEND.**—Sept. 7.—Designs are invited for a church to accommodate 500 persons, a clergy-house, and a parochial hall or parish-room about 50 feet by 30 feet. Mr. C. H. J. Talmage, Kathleen Villa, Southchurch Road, Southend-on-Sea.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**TOTTENHAM.**—July 15.—Designs are invited for municipal buildings, fire station, public baths, &c. Premiums of 200*l.*, 100*l.* and 50*l.* are offered for the three best designs in order of merit. Mr. W. H. Prescott, surveyor to the Council, Tottenham.

## CONTRACTS OPEN.

**ALDERSHOT.**—July 23.—For erection of stables, cartsheds and other buildings in connection with the new depôt. Mr. Nelson F. Dennis, surveyor, Aldershot.

**ALLERDEAN.**—July 15.—For erection of the proposed new P.M. church at Allerdean. Mr. J. Mowitt, Shoreswood, Norham-on-Tweed.

**ASHTON-IN-MAKERFIELD.**—July 15.—For erection of a country police station at Ashton-in-Makerfield. Mr. Henry Littler, architect, County Offices, Preston.

**BALHAM.**—July 15.—For alterations and additions to the tramways depôt. Architect's Department (General Section), L.C.C., 19 Charing Cross Road, W.C.

**BATLEY.**—July 14.—For alterations to tailoring department and erection of new workrooms in Commercial Street, Batley, Yorks. Mr. Harry B. Buckley, architect, 85 Commercial Street, Batley.

**BISHOP AUCKLAND.**—July 14.—For several works required in renovating and decorating the Primitive Methodist chapel, Toft Hill. Rev. W. D. Cox, Toft Hill.

**BOSTON.**—July 14.—For erection of municipal buildings. Mr. Jas. Rowell, architect, Borough Offices, Market Place, Boston.

**BRADFORD.**—July 14.—For erection of buildings on a site in Drummond Road, Manningham, Bradford. Messrs. Empsall & Clarkson, architects, 7 Exchange, Bradford.

**BRADFORD.**—July 15.—For several works (except mason) required in erection of nine terrace houses in Rushton Road, Thornbury. Messrs. Fairbank & Wall, architects, Craven Bank Chambers, Bradford.

# CABOT'S INSULATING & DEAFENING QUILT.

## A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

## A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay moth, and vermin-proof, and unflammable.

## FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

## CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

# CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

# THE "B. & S." FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

## CORRESPONDENCE.

**The Betterment of London.**

SIR,—I ask permission to place before the public, through the medium of your influential Journal, some particulars regarding the recently established Betterment of London Association, of which I have accepted the presidency for the current year. The Press has always been foremost in the advocacy of any movement which has the public welfare at heart, and I therefore feel confident of its support in the present instance. The principal items of our programme are as follows:—

*Section I.*—To agitate for a quieter London, primarily in respect to unnecessary and objectionable street noises, such as those produced by organ-grinders, costermongers and news-boys; for a healthier and cleaner London, obtainable by a constant removal of refuse of all descriptions and in other ways; and for a more clearly designated London. In this latter respect the Association will direct attention, amongst other matters, to the illegible naming of public thoroughfares, and to the insufficient manner in which names are illuminated after dusk.

*Section II.*—To agitate against the immigration of pauper aliens (obtaining legislation thereon, if necessary); against the employment, in the streets, of children under ten years of age, and after nine o'clock P.M. of children under twelve years of age. To draw attention to the extreme danger to health engendered by the obnoxious habit of expectorating in public conveyances and buildings; to promote action against the sale of impure ice cream (another very fruitful source of disease); to direct the attention of the authorities to the Act relating to betting and gambling in public places; and to agitate against the constant digging up of the highways to the great inconvenience of the community.

*Section III.*—To impress upon the municipal and other authorities of the Metropolis the necessity of enforcing, as in Liverpool, the registration of street "musicians" and street traders, including newspaper vendors, and to impress upon the railway companies the desirability of freeing their stations and approaches from all idlers and hawkers.

From these statements it will be seen that the Association is instituted for the service of the public, and that it has at heart the desire to make London—what it certainly is not at present—the best-governed city in the world. The propaganda will be carried on by public meetings and conferences, by

deputations and petitions to local authorities, to the Office of Works, &c, by the publication of health leaflets, of literature relating to Acts of Parliament, by-laws, &c, and in various other ways.

In conclusion, I would add that if any of your readers are disposed to co-operate in this much-needed movement for the betterment of London, and thus help it to grapple with many nuisances which ought to be abolished, they should communicate with the hon. secretary, Mr. Bowden Green, at the offices of the Association, 1 Finsbury Circus, E.C.—I have the honour to be, sir, your obedient servant,

W. B. RICHMOND,  
President.

July 5, 1902.

### THE TRAMWAYS AND LIGHT RAILWAYS EXHIBITION.

THE second International Tramway and Light Railway Exhibition now being held at the Agricultural Hall, Islington, and which closes to-morrow, comprises about two hundred exhibits of a most interesting character. A general examination thereof cannot fail to impress visitors with the progress which has been made in various branches of the industry since the first exhibition was held two years ago.

The Chloride Electrical Storage Syndicate, Limited, of Clifton Junction, near Manchester, and 39 Victoria Street, S.W., show some samples of their well-known storage batteries, the appellation of "chloride" having been adopted on account of the utilisation of chloride of lead as the chief component of the negative plate. The main characteristics of the chloride "R" type battery are its mechanical strength and its ability to withstand high rates of charging and discharging—capabilities rendered essential by modern requirements. Examples of C. R. type and double C. R. type cells for large capacities and heavy discharge rates are exhibited, also samples of cells suitable for electro-pneumatic systems of control, solenoids for surface-contact systems, automatic electric signalling, lighting of car-sheds and power-stations, &c. The extended use of storage batteries in connection with electric traction systems has created a demand for some apparatus that would enable more advantage to be taken of the fact that a battery can be discharged, if necessary, at very high rates. This has been met by the Highfield patent Booster, which in combination with the chloride battery maintains a steady voltage with any

RHINEFIELD, HANTS: VIEW FROM THE TERRACE.

variation of the line amperes, and, moreover, enables the generating plant to work at a constant load, and when discharged through a Highfield Booster the battery is much more lively than when in simple parallel with the generator. The battery booster panel exhibited is a standard panel for a battery and booster capable of dealing with peaks of 400 amperes on a 550-volt circuit.

Messrs. Greenwood & Batley, Ltd., of Leeds, exhibit their "Zeta" type centrifugal pump, coupled direct to an electric motor. The pump is arranged for lifting water against a head of from 150 to 200 feet, while the motor is arranged for continuous current and for running at a high speed. The same firm also have a De Laval patent steam turbine dynamo, of 30 brake h-p, capacity 20 kilowatts. The steam turbine is coupled direct to a 20 kilowatt dynamo, both being erected on the same bedplate.

Among the exhibits of the Hadfield's Steel Foundry Co., Ltd., are the Hadfield's special car wheels of the most improved type. They are composed of a cast steel centre and fitted with a rolled-steel tyre, exhaustive tests having proved that the grades of steel used for the centres and tyres are the most reliable and durable for the purpose. Other items included in the exhibit are illustrations of the various types of joints; samples of their best cast-iron brake shoes; also samples of their best toughened cast-steel flangeless wheels, as well as some cases containing samples of the various classes of hammers, picks, tools, &c, which Messrs. Hadfield's are in a position to supply.

The Dowsing Radiant Heat Company, Ltd., make a display of their luminous electric radiators, which may be used for warming public halls, waiting-rooms, private houses, &c. The standard size of radiator, with four heat lamps, consumes, we are informed, one unit of electricity per hour, but may be turned down to one-half, or turned off altogether, by means of the switches supplied.

The exhibits of Messrs. Doulton & Co., Ltd., comprise specimens of the Doulton conduit, which is made with two, three, four or six rectangular ducts in one block; a full-size section of 18 way conduit constructed of 3-way ducts built up in concrete; Doulton troughs for solid-system cable laying; specimens of the Cockrill-Doulton patent system of concrete construction, carried out with tiles of special section; and a large model of Doulton's patent water-softener for steam users, &c.

Messrs. Robert W. Blackwell & Co., Ltd., have a good display of trolleys, insulating material, trucks, tramway tools and steam fittings, including an interesting selection of valves, purifiers, separators and all accessories for the power station, besides electric fittings of various kinds. At this stand are also shown samples of the well-known P. & B. ruberoid roofing, which is light and very durable, waterproof and odourless, besides possessing other merits that are widely recognised.

Among other exhibitors we may also mention Messrs. J. Kaye & Sons, Ltd. carriage wedge lock, automatic sliding door latch, and Kayes' patent locks and handles for numerous other purposes; Messrs. Mellowes & Co.'s samples of the "Eclipse" patent glazing; Albion Clay Co., Ltd., conduits and troughing (Sykes' patent); the Britannia Co., insulating material, overhead trolley line fittings, repair shop tools, and a representative display of photographs of heavy machine tools and engines; the Typewriting Telegraph Corporation, type-printing telegraph (Stelge's patent); Sam Deards, patent glazing, specially adapted for glass roofs of car sheds, electric power stations, engineering workshops, railway stations, &c; the "Simplex" Steel Conduit Co., Ltd., the "Simplex" steel conduit system for electric wiring, with special fittings and accessories. Important exhibits may be noticed besides at the stands of the General Electric Co. (1900), Ltd.; the United Asbestos Co., Ltd.; the Cape Asbestos Co., Ltd.; Dick, Keir & Co., Ltd.; the British Thomson-Houston Co., Ltd.; the Western Electric Co.; the London Basalt Stone Co., Ltd.; and J. P. Hall & Sons, Ltd.

THE St. Helen's Town Council on Saturday confirmed a recommendation of their parliamentary committee to appoint Mr. W. H. Andrew, town clerk of York, to be town clerk of St. Helen's, at a commencing salary of 800*l.*, rising to 1,000*l.* in two years. Mr. Andrew, who was present, accepted the appointment.

## NEW CATALOGUE.

IN the new catalogue just issued by the Pulsometer Engineering Company, Ltd., of Reading—where, owing to their works at Nine Elms, S.W., having become too small for increasing business, they have established new works—illustrated particulars are given, in addition to the descriptions of the Pulsometer pump in its various forms and what it will do, of the various places where it is in actual use, and the different purposes for which it is being at the present time employed.

## TRADE NOTES.

THE Corporation of Stockport have just accepted the design and estimate of Messrs. Messenger & Co., Ltd., horticultural builders, Loughborough and London, for a large range of glass houses at Vernon Park.

MESSRS. W. POTTS & SONS, clock manufacturers, Guildford Street, Leeds, are now erecting a new eight-days' illuminated turret clock, showing the time upon three external dials, for Messrs. Gray, Peverell & Co., West Hartlepool, for Mr. Garry, architect.

MESSRS. JAMES GORDON & Co., of 52 Lime Street, E.C., have been appointed sole British and colonial agents for water-turbines, &c., manufactured by James Leffel & Co., of Springfield, U.S.A. We understand that Messrs. Gordon & Co., who have had considerable experience in this line, have several installations of these turbines at present in hand.

WE learn that improvements have lately been made at the London Hop Exchange, and that a new electric passenger machine has been erected by Messrs. A. Smith & Stevens, of Battersea. In view of much that has been said lately about foreign competition, it is interesting to note that this machine is of entirely home design and manufacture.

IT appears from the annual report (the fifty-first) just issued by the Birkbeck Building Society that the Society has again enjoyed a prosperous year, each department showing a substantial increase, and, after writing off all realised losses, there remains a clear surplus profit of 20,353*l.* 9*s.* 1*d.* for the year, thus increasing the permanent guarantee and temporary funds to 533,576*l.* 6*s.* 6*d.*, being the largest sum ever reached, while the register of shareholders now contains the names of 15,742 members, and, in addition to these, there

are 77,961 depositors, bringing up the total of members and depositors to 93,703, showing an increase on the year of 2,661.

## ELECTRIC NOTES.

THE Weymouth electric-lighting committee have recommended the Council to approve of a scheme for lighting the borough at a cost of 44,800*l.*

THE Electric Lighting Boards Company contributed to King Edward's Hospital Fund by undertaking the entire illumination of the Crystal Palace transept on the occasion of the great Empire Ball last week, and at the same time were able to do some record work so far as time was concerned. The installation comprised 2,200 lights, worked in the form of an enormous velarium over the centre of the transept, and outlining the galleries and Royal box in festoons. The lights and festoons were covered with artificial flowers, and the number of connections required some two miles of cable, as the distance from the supply source was considerable. The whole of this work was executed in three days of ordinary working hours by three men and two boys under the supervision of the foreman, including the garlandwork and very difficult fixing at great heights. The effect was so artistic that the Crystal Palace authorities retained the work for the American Festival on Saturday, and some well-known caterers propose taking over the whole of the installation.

## VARIETIES.

THE new town clerk entered on his duties at Northampton on Monday last.

THE corner-stone of the new church of St. Cyprian, Dorset Square, Marylebone, was laid on Monday afternoon.

THE consecration of a German church in Marton Road, Middlesbrough, took place on the 2nd inst.

THE Trappist monks who have settled near Kingsbridge, South Devon, have, it is said, decided to spend the sum of 30,000*l.* in the erection of a monastery.

THE Seabrook Hotel at Hythe having been taken over by a new company, has been reconstructed and refurbished, and reopened as the Hythe Imperial Hotel.

See our Exhibit at the Royal Agricultural Hall, August 12 to 22, Stand 56.

The Yale and Towne M'f'g. Co., New York.

## PATENT WIRED ROLLED GLASS.

(About 1/4 inch thick.)

RESISTS FIRE.  
PROTECTS LIFE.  
HINDERS BURGLARY.  
PREVENTS ACCIDENTS.

A NEW Primitive Methodist chapel and schoolroom at Witton-le-Wear, Bishop Auckland, built at a cost of 1,500*l.*, was opened on Saturday afternoon.

AT a meeting of the finance committee of the Southampton Corporation on the 3rd inst., the salary of the town clerk (Mr. R. R. Linthorne) was considered, and after some discussion it was resolved that the salary be increased to 700*l.*, rising by three annual increments of 100*l.* to a maximum of 1,000*l.* per annum.

ON the 2nd inst. a Local Government Board inquiry was held by Col. A. C. Smith, R.E., at Newlyn, Penzance, with regard to the scheme prepared by Messrs. Merryweather & Sons, Ltd., of London, for providing a supply of water to a portion of the village from an old mine adit. The proposals include a service reservoir, standposts with waste-preventing taps and fire-hydrants. The quantity of water available is ample for all purposes.

THE National Telephone Company's exchange in London Wall was the scene of a destructive fire on Wednesday evening. Fortunately the greater number of the employes had left, and the few remaining on the premises had no difficulty in effecting their escape. The damage done is very extensive, and will result in a complete stoppage of telephone operations from this exchange for some little time, as most of the wires have been destroyed, while it is feared that the dynamos and engines, &c., in the lower part of the building will be irretrievably damaged.

THE sale by auction is announced as to take place on the 17th inst., by Messrs. Eldridge & Son, of Martin's Lane, E.C., of Thornlaw House, Thornlaw Road, West Norwood. It is described as a substantially built, freehold, detached residence, standing in grounds of half an acre, and offering excellent accommodation for a family. It contains, moreover, a specialty which, if not unique, is at least uncommon in a house of its size, in a spacious recreation-room, 33 feet by 30 feet, heated with hot-water pipes, comprising swimming-bath, 30 feet by 10 feet; studio, photographic dark-room, fitted with lead-lined sink with grating, supply tap and spray, double ruby glass windows, &c.; and a Turkish bathroom, fitted with bath, with hot and cold-water supply, and hot-room fitted with slate slab. This is an excellent opportunity of obtaining a first-class residence in a good neighbourhood and within easy reach of the City.

THE programme at the Alhambra is just now of a very attractive nature. It comprises the graceful ballet

"In Japan," with its bright music and brilliant and picturesque scenery and dresses, as well as the Coronation *divertissement* "Britannia's Realm," which consists of a series of beautiful pictures illustrating in a graceful and fanciful manner the history of the development and progress of the British Empire. It is needless to say that produced as it is under Mr. C. Dundas Slater's direct supervision, this ballet is, from every point of view, a beautiful work of art, which seems to be quite to the taste of our colonial and foreign visitors who nightly throng this popular place of entertainment. Among the numerous good turns must be mentioned Mr. Ian Colquhoun, La Belle Otero and Les Minstrels Parisiens, all of whom are old and ever-welcome favourites.

### BUILDING AND BUILDERS.

ON the 5th inst. the memorial-stone of a new masonic hall at Bellshill, N.B., was laid.

THE foundation-stone of new church halls in connection with Anderson United Free Church, Partick, N.B., was laid on Saturday.

THE memorial-stones have been laid for a new church for the Methodist New Connexion, Ryan Street and St. Stephen's Road, West Bowling, Bradford. The church will accommodate between 400 and 500 persons, and the school provides seats for 250, with nine classrooms, lecture-room, &c. It is expected that the new church will be opened in May next.

A COMMITTEE of Edinburgh School Board is at present in negotiation for a site for a school to serve the Easter Road district. The committee is in communication with the Trinity Hospital for a site in Albion Road, but the negotiations have not yet been concluded, and in the event of the two committees not coming to an understanding, the School Board committee have other sites in view. The new school is intended to accommodate about 1,200 pupils, and is rendered necessary by the great congestion at the other schools in the vicinity.

THE foundation-stone of a new church in the Leeman Road district of York was laid on Saturday last. The district forms part of the extensive parish of St. Paul's, occupying a remote corner separated from the rest of the parish by the railway, and its population, mainly working class, has increased so rapidly in recent years as to render the provision of further church accommodation absolutely necessary. The new church will be known by the name of St. Barnabas. The site

has been presented by Mrs. Ashton, and the estimated cost of the building is 3,800/.

AN inquiry was held on the 2nd inst. at the Plumpers' Inn, Tinsley, by Mr. H. Percy Boulnois, M.Inst.C.E., relative to an application by the Rotherham Rural District Council to the Local Government Board for sanction to borrow 4,200/ for purposes of sewerage and sewage disposal. Mr. J. H. Pickford (Messrs. Oxley & Coward, Rotherham) appeared to support the application, and there were also present Mr. S. Pope, chairman of the Tinsley Parish Council and a member of the Board of Guardians; Dr. Weatherbè, medical officer of health; Mr. J. Platts, engineer; Mr. W. Booth, assistant clerk; Mr. W. S. Jackson, West Riding Rivers Board; Mr. B. Hey, sanitary inspector; Mr. Meades, Mr. G. H. Capper and others. The scheme having been clearly explained to him, the inspector visited the sewage works, and expressed satisfaction with the same and the effluent obtained. He also inspected the site of the proposed collecting tank and pumping station.

### RESPONSIBILITY FOR ACCIDENTS IN CONSTRUCTION.

ON Monday last Mr. Alexander M'Dougall, timber merchant, appeared before the High Court of Justiciary, Glasgow, charged with culpable homicide. The indictment stated that he had undertaken to erect structures in Ibrox Park, Govan, in a substantial manner, and to use red pine of the best quality for the bearers and joists supporting the flooring of the terracings of said structures, and to place or cause to be placed the said bearings or joists broken-banded or alternately long and short; whereas he did "culpably and recklessly, and in violation or neglect of his duty, fail to erect the timberwork of the said terracings in a substantial and tradesmanlike manner," and used, or caused to be used, wood of an inferior quality of yellow pine instead of red pine of the best quality, and further, that he placed the bearers and joists all short instead of alternately long and short or broken-banded, and the half of a portion of the western terracing gave way, that having been caused by the use of yellow pine instead of red pine, and by the placing of the bearers or joists all short instead of alternately long and short, a number of persons being precipitated to the ground and mortally injured.

Evidence was given by several witnesses, including Mr. A. Leitch, C.E., Mr. C. P. Hogg, C.E., Mr. Gordon, architect, and

Mr. W. G. Holmes, burgh surveyor, mainly in respect of the inferior quality of the timber.

For the defence Sir Benjamin Baker said he had made an examination of the terracing at Ibrox Park. The material used was very much below the usual standard of strength. He had fixed thirty years ago a standard of strength for timber, and he still held by it. He took 2 tons per square inch as a fair working strength of the fibres at the lower part of the beam, which was equal to about 2½ cwt. suspended from the centre. It was possible to have wood cut from yellow pine which would be twice as strong as wood cut from red pine. He would apply a test indifferently to red or yellow pine. He placed no great reliance on the figures given in text-books. Those books were in some cases seventy years old, and were based on specimens of the wood without any knots. It was not correctly affirmed that yellow pine is weaker than red. On the whole, red pine would be some percentage stronger than white pine; but for practical purposes, in which you have to take such timber as you can buy, there is nothing in any experiment that would justify you making any difference. In his experience he made no such difference. He did not blame the engineers; they applied their knowledge to the best of their ability, but, unfortunately, the only text-books available for them were not up to date.

If the experiments were properly made he would be satisfied with a factor of safety of six. With the terracing built of red pine joists he would allow a weight of 25 lbs. per square foot, as against the 94 lbs. allowed by Mr. Leitch and the 80 lbs. allowed by Mr. Holmes. If 25 lbs. had been allowed, the terracing would not have fallen down. If he had been consulted, he would have had the stand calculated to bear a pressure of 112 lbs. per square foot, instead of 25 lbs. In his judgment the structure was far too slender, and even if the best red pine had been used for the joists, the accident would have taken place all the same.

According to his practice, 25 lbs. per square foot was the weight which the stand would safely bear. From the description of the crowd it was extremely probable that the load upon the stand was 75 lbs. per square foot, or three times what he considered safe. If the timber was of atrociously bad sort, it must have been noticed before twenty-five people were killed. In all his experience he had never seen a structure so dangerously light for such a purpose.

In cross-examination witness said he did not examine specially the timber used in the terracing; he thought experts

would have dealt with that matter. By the phrase "the best quality of red pine" he meant the best quality for the purpose. He did not think it wrong for a contractor to substitute white pine for the wood named in the contract if it was equal to the purpose. He would use a wood which was fitted for the purpose; he judged the whole thing from an engineer's point of view. He admitted that he had never heard before that there was a class of timber that was known as outclassed.

Do you think it is proper to use timber for joists that is only fit for packing cases?—It would not be proper if it were not strong enough.

The Advocate-Depute (pointing to pieces of the broken timber) asked witness if he had ever seen wood of that character used for joists. Sir Benjamin explained that he had often seen wood of that character. He added that he did not care what they called the wood provided it reached his requirements. For practical purposes yellow and red pine was equally strong. The Advocate-Depute referred to a book by the witness published in 1870, where he wrote that red pine had a higher percentage. Sir Benjamin explained that that was correct in regard to the specimens experimented with, but, he added, you go back to 1870; you might as well go back to the maps of Africa in 1870. He had not the slightest doubt that the engineer did the best with the sources of information at hand. You doubt the reliability of those sources of information?—Certainly, as to their adaptability in practice.

Re-examined: If Mr. Leitch had made the proper calculation, and taken the risk of the joists that were used, the accident would not have occurred. From what he knew about crowds, he believed that these joists had been subjected to three times the load that ought to have been put upon them. He would not have put more than 25 lbs., and, judging by the crowd that was at the match, there would be, he estimated, about 75 lbs. per square foot. The joists stood three times the load which he would have put upon them. It was on account of the design of the structure that the accident took place, and the yellow pine had nothing to do with it.

Sir William Arrol stated it was his opinion that an insufficient quantity of timber was the cause of the accident. The joists were 4 feet apart, and measured 8 by 3. The crowd that would have to be carried under the circumstances was greater than any timber should be subjected to, because timber is such an unreliable material. You require to have a very large margin of safety. Even in the best-selected timber there was inequality in the planks coming out of the same tree. The

margin of safety allowed was practically 10 in every case. So far as he had been able to understand, and from his own experience, he always thought that yellow pine, if good, was a better class of timber than red pine; there were fewer knots in it. The yellow pine used was a fair average quality. The accident was caused by the fact that the structure was too light. The question of yellow or red pine had nothing whatever to do with it.

Cross-examined: He could not say he had expert knowledge, but he had an experience of over forty years, and he thought he had more knowledge than a great many joiners. There was no stability in the terracing. If it was crowded to its full capacity it must break down. He did not think there was practically any margin of safety. A structure of such a kind should have been able to carry ten times more weight than was actually on it.

Mr. Carl Bonn, C.E., said he believed that the stand gave way through lack of joisting.

The jury returned an unanimous verdict of "Not guilty."

### NEW NURSES' HOME AT GUY'S.

THEIR Royal Highnesses the Prince and Princess of Wales drove to Guy's Hospital on Monday for the purpose of opening the Henriette Raphael Nurses' Home, which has been erected and equipped at a cost of 68,000 $\frac{1}{2}$ l., a portion of which was contributed by the late Henry Lewis Raphael in memory of his wife, after whom it is named. The home is built in the form of a hollow square, having on the one side a power house from which will be supplied all the motive force required for lighting, heating, lifts and pumps. On the floors above this are the laundries, and this department alone employs some forty women, as about 20,000 items of linen are dealt with every week. There is also a steam disinfectant and steriliser, an appliance of vital importance in such an institution. A subway connects the residential blocks with the hospital, and on the ground floor are the kitchens and domestic offices, while anyone who knows the general routine of a nurse's life will appreciate the boon it will be to the nursing staff to have their own meals separately cooked away from the pervading influences of invalid dietary. Special sitting-rooms for the home sister and the staff nurses are provided, while the general drawing-room is a spacious,

lofty apartment charmingly decorated in soft pink and white. A warmer tone of old rose has been adopted for the dining-hall, which has also handsome wood panelling and will ultimately contain a fine fresco from a design now on exhibition in the Royal Academy. There are four floors, with a lift and internal and external staircases leading to each one. Upon each are from forty-eight to fifty-eight separate bedrooms, which are not mere cubicles, but apartments securing to each occupant complete privacy and quiet. Every room is prettily distempered in pale green, and furnished with bed, chairs, combination wardrobe and drawers, and a fixed basin fitted with hot and cold water-taps. Though every floor is liberally supplied with bath-rooms, a unique feature of the home is its swimming-bath, 50 feet long, with a water area of 12,000 square feet. This was a special gift from the two sons of the late Mr. and Mrs. Raphael.

### GEOGRAPHICAL NAMES FOR MANUFACTURES.

In the Chancery Division of the High Court of Justice on the 2nd inst., Mr. Justice Byrne delivered his reserved judgment in the actions Worcester Royal Porcelain Company, Ltd., v. Locke & Co., Ltd., and the same v. W. H. Rhodes, both of which involved the question of the right to use the word "Worcester" in connection with the manufacture and sale of china and porcelain.

His lordship said: In the year 1751 the first manufactory for the production of porcelain or china was established at Warmstry House, Worcester, by Dr. John Wall, in conjunction with the other persons; and the original articles of partnership commence with the recital: "Whereas a new manufacture of earthenware has been invented by John Wall of the city of Worcester, doctor of physic, and William Davis of the same, apothecary, under the denomination of Worcester porcellain." In 1772 the manufactory was sold to the Rev. Thomas Vernon, who appears to have transferred it to J. Wall, jun. It was subsequently transferred to J. Wall, sen. & Co., and in 1783 the business was sold to a Mr. Flight. In 1793 Mr. Barr was taken into partnership, and the firm name became "Flight & Barr;" other changes took place in 1837 and 1843, the firm name becoming first "Barr, Flight & Barr," and then "Flight, Barr & Barr." It so continued until 1840. In the meantime, viz. in 1786, Robert Chamberlain, who had been in the service of the Warmstry House firm, started in business for

himself, and in 1788 he established a manufactory of china or porcelain at Diglis, in Worcester. In the year 1828 Walter Chamberlain and John Lilly became the proprietors of the Diglis works, and so continued until 1840. In that year there was an amalgamation of the two firms, the works at Warmstry House were closed, and the business was then carried on as "Chamberlain & Co." at Diglis only. In 1850 and 1852 there were other changes in the firm, and in 1862 the plaintiff company was formed and acquired the business, which has ever since been carried on by them at Diglis. There had, however, been another and rival business set up in 1801, when Thomas Grainger left the service of Messrs. Chamberlain and established a new manufactory at St. Martin's, Worcester. That business was carried on first under the style of "Thomas Grainger & Co.," subsequently as "George Grainger," and afterwards as "George Grainger & Co.," until the year 1889, when this business and manufactory was also acquired by the plaintiff company, who then became the only manufacturers of china or porcelain in Worcester, and so continued until 1897, when Edward Locke, who had been in their employment, set up a new manufactory. This business, in 1898, became the property of the defendant company, who have sold, and claim the right to sell, the china manufactured by them as "Worcester" or "Worcester china." It is to restrain this, and to establish the alleged exclusive right of the plaintiff company in respect of the word "Worcester" in connection with china or porcelain and similar manufactures, that the present action is brought.

It appears from the facts I have stated that from 1786 to 1801 there were two manufactories in the hands of distinct firms; from 1801 to 1840 three such manufactories and distinct firms; and from 1840 to 1889 two manufactories and firms engaged independently in china manufacture at Worcester. The goods of all these firms became well known, and gained a very high reputation. The word "Worcester" in connection with china or porcelain and similar wares has undoubtedly for considerably more than a century acquired a secondary meaning, outside and independent of its primary geographical signification. This secondary meaning denoted and defined the goods of particular makers, the produce of particular manufactories, and is applicable as well to what I may term current manufacture for the time being as to older productions. In addition to the ordinary everyday commercial dealing in the products, as between manufacturer and dealer and between dealer and the public, in the common course of trade,

BRATT: COLBRAN & CO  
10 Mortimer St London, W.

there are and have been for many years past, owing to the intrinsic artistic merit and beauty of some of the goods manufactured by the several firms I have mentioned numerous sales of old specimens. Amongst dealers and purchasers of such old specimens the expression "old Worcester" is ordinarily used to distinguish such articles from more modern ones. The dividing line between old Worcester and modern Worcester is naturally one which shifts from time to time. But I need not dwell on this matter, as the question in the present case is, I consider, whether or not, at the date of the acts complained of, the word "Worcester" had acquired a secondary meaning as applied to china currently produced as a commercial article, and, if so, did it denote the goods of the plaintiff company to the exclusion of other goods of a similar nature.

It is not disputed that there are no natural advantages in the way of soil or water or otherwise attaching to Worcester making it specially suitable for the manufacture of porcelain; and, so far as appears, there is no reason, beyond the fact that Dr. Wall happened to be resident at Worcester, why the place was chosen originally as a seat of manufacture. More than this, although there are and have been certain typical classes of articles from time to time produced by the Worcester makers which are readily recognised as "Worcester," the manufacture has never been confined to any special types. All classes of porcelain and similar wares have been produced, and all descriptions of design, subjects and colouring have been made use of. The actual method and ingredients of the paste used has varied, and it is not contended that "Worcester" china means only china of a particular paste, glaze, style, model, design or colour. It is admitted that never at any one time has the use of the word "Worcester" denoted the goods of more than three contemporaneous firms, all of which are now represented by way of succession by the plaintiffs. From the year 1840 until 1889 the word "Worcester" denoted to all purchasers the goods produced at one or other of two manufactories and of one or other of the proprietors of such manufactories, and in and since 1889 it always denoted the goods of the plaintiff company produced at one or other of their establishments. The circumstances in the present case are not as simple as in the cases of *Seixo v. Provezende* (L.R. 1, ch. 192), *Montgomery v. Thompson* (1891, A.C. 217) and *Wotherspoon v. Currie* (L.R. 5, H.L. 521), where there had never been more than one firm whose goods were denoted by the word the use whereof was complained of, and it is argued that the word "Worcester," as applied to china, has never

designated the goods of one manufacturer to the exclusion of all others; that it has always denoted all china made in Worcester and the productions of all manufacturers past and present who have made china there. Consequently, it is said, the word "Worcester" means china made in Worcester, and any person choosing to make china in Worcester is entitled to designate his goods "Worcester" or "Worcester china." I think that this contention fails, in view of the distinction I have pointed out between the meaning of the word as applied to current trade productions and as applied to older productions of the plaintiffs' predecessors in business. In the view I take of the evidence I do not think it necessary to decide what were the rights of the plaintiffs prior to 1889 in respect of the word "Worcester," because between that date and the commencement of sales by the defendant company and Mr. Locke, their predecessor in business, the word "Worcester," as applied to current trade productions, acquired and had a secondary meaning as denoting goods made by the plaintiffs at one or other of their manufactories to the exclusion of all other manufacturers of china or porcelain and similar articles. I may, however, say that, as at present advised, I am not prepared to accept the view that the plaintiffs would have had no enforceable rights under the circumstances against a third person starting a new business and selling his goods as "Worcester china," simply because one other firm had an equal right with the plaintiffs to use the words as descriptive of their goods also.

Then it is said by way of defence that, even if the plaintiffs might otherwise have had such a right as they claim, they have lost or abandoned it by their course of conduct in reference to the designations they have given to their own goods, and otherwise. For some time prior to 1889 the plaintiffs had adopted and they still use in connection with their business the word "Royal," so that on all their business showcards relating to goods made at Diglis their goods are referred to as "Royal Worcester." Besides their registered trademark, which is impressed or printed on all their goods, but which does not contain the word "Royal," they have registered the trademarks "Royal Worcester," "The Royal Porcelain Works," "The Royal Porcelain Works, Worcester" and "The Worcester Royal Porcelain Works," and I think that, with reference to all goods made by the plaintiffs at Diglis, now called the "Royal Porcelain Works," they have from some time previously to March 1889 used as generally as possible the word "Royal" as well as "Worcester" in connection

with their goods. The plaintiffs have also, since they acquired the Grainger Works and business, kept their works as a separate establishment, and in the showcards have always kept up the distinction between the goods made there and the goods made at the Royal Porcelain Works. Their cards describe the goods from the Grainger Works as "Worcester china manufactured by Grainger & Co., Worcester," or as "Grainger Worcester china," and they have continued to use the old trade-mark containing the words "Royal China Works, Worcester." I do not think, however, that the plaintiffs are disentitled to relief on this ground, as, although "Royal Worcester" undoubtedly does describe, and is known to describe, goods of the plaintiffs made at one of their factories, and the words "Grainger's Worcester china" in like manner describe, and are known to describe, goods of theirs made at another of their factories, I do not consider that their goods are less known and identified by the word "Worcester" without the addition of "Royal" or "Grainger's," and I may point out that in *Montgomery v. Thompson*, as appears in the early part of the speech of Lord Herschell, in advertising Stone ale the name of "Joule & Co." was generally associated with the words Stone ale (see 1891, A.C., at page 219). The defendants' showcards are four in number, in each of which the word "Worcester" is employed as descriptive of the articles advertised, and in one of them the words "Worcester china" alone appear, without the name of any manufacturer.

I am of opinion, although no actual instance of deception has been proved, that the acts of the defendants are calculated to deceive purchasers and the public into the belief that the goods of the defendants are the goods of the plaintiffs. The defendants are entitled to advertise fairly the experience of Mr. Locke, their managing director, in connection with the manufacture of china, and also fairly to describe his former employment with the plaintiffs and their predecessors in business. They are also entitled fairly to give the address of their works at Worcester. But they are not, in my opinion, entitled to use the word "Worcester" in connection with their goods without clearly distinguishing such goods from the goods of the plaintiffs. I think that none of the show-cards used by the defendants do sufficiently distinguish their goods from the goods of the plaintiffs; and, as at present advised, I do not well see how the defendants can use in immediate conjunction the words "Worcester china," "Worcester porcelain," or "Worcester ware," and at the same time sufficiently distinguish their goods from the plaintiffs. I say this as a

guide to the defendants, and to avoid, so far as I can, further discussion on a motion to commit. Put generally, the word "Worcester" ought not to be used as denoting the name or designation of the article; and I would point out that in *Wotherspoon v. Currie* (L.R. 5, H.L. 521) the fact of the word "Glenfield" being printed in large type is specially referred to as unjustifiable under the circumstances. I mention this because I should have thought one or two of the earlier show-cards used by E. Locke and by the defendants unobjectionable, had not the word "Worcester" been printed in specially large type as compared with the rest of the address, obviously, as I think, to enable the word "Worcester" to be more readily used as the denomination of the goods advertised. As to the trade-mark, although I think it very doubtful, on the whole I am of opinion its use should not be restrained. It would be fairer, however, to put the name of the defendants' works on it in the same type. The right form of injunction, having regard to what was said in *Montgomery v. Thompson*, will be to restrain the defendants, their servants and agents, from selling or offering, or exposing, or advertising for sale, or procuring or enabling to be sold, any goods made of china or porcelain or any similar material not manufactured by the plaintiffs or by their predecessors in business, or some or one of them, under or in connection with the word "Worcester," without clearly distinguishing such goods from the goods of the plaintiffs. As to the second action against the defendant Rhodes, a retail dealer, who bought articles made by the defendant company, that must, as arranged, follow the result of this action, and an injunction must be granted against him in proper form. The plaintiffs, of course, must have their costs.

A stay of the injunction in the first action, pending an appeal, was granted on the defendant company's undertaking to keep an account from this date of all sales made within the terms of the injunction, and to repay, if the appeal was unsuccessful, all profits made by virtue of such sales.

#### NEW BATHS AT LIVERPOOL.

The baths committee of the Liverpool City Council performed good work on Monday last when, in addition to formally opening the new "People's Baths" in Beacon Street, they also laid the foundation-stone of new baths which they are erecting in Lister Drive, West Derby. The first-named building stands on an area of 450 square yards, and comprises seventeen

Vol. LXVI. of THE ARCHITECT. Handsomely bound in Cloth. Price 12s. 6d.

shower and spray baths and two ordinary slipper baths. The baths are arranged in cubicles in the bath-hall and constructed in slate. Each cubicle covers an area of 7 feet by 3½ feet (just half the area covered by an ordinary slipper bathroom). It consists of a dressing-box and the shower and spray cabin; the dressing-box is provided with a seat, clothes hooks and foot-board. It is separated from the shower and spray cabin by a slate division, with passage opening having a waterproof curtain; the entrance from bath hall to dressing-box is also protected or screened by means of a curtain. The shower and spray cabin has a portion of its floor depressed, so as to form a foot-bath, the overflow of which is fixed at such a height as to allow the water to cover the bather's ankles. This allows the bather to thoroughly soap himself, and to wash his feet before using the warm spray bath or shower. The shower, which is the chief feature of the system, is placed overhead, and is formed in a circular ring, so that the water does not strike the bather's head, but falls in a gentle shower on his shoulders. As the body is cleansed, so is the dirt carried down to the feet and into the drain. When the bather is thoroughly cleansed, by the manipulation of a lever the temperature of the water can be reduced to suit. A spray or needle is fixed at one side of the cabin whereby the bather may enjoy its tonic effects.

Apart from its lower cost and economy of space, the shower and spray bath possesses many advantages over the ordinary slipper-bath, viz. it is perfectly simple, certain cleanliness is insured, all risk of infection or contagion avoided, less danger of taking cold after use, the tonic effect of the spray on the skin is valuable, stimulating the skin, thus protecting the bather against subsequent exposure. The administrative department of the establishment is simple, effective and self-contained. A small steam-boiler is provided in the basement, which will supply the steam for calorifiers to maintain the warm water at a temperature of 95 degrees Fahrenheit. It will also provide the steam for steam coils to drying-houses in laundry, and to the radiators for heating the bathing halls and waiting-rooms. There is a dwelling-house for the caretaker and his wife, containing living-room, pantry and two bedrooms. A laundry is provided for towel washing. The establishment was designed by Mr. W. R. Court, the baths and wash-houses engineer, who personally superintended its construction. The buildings are homely in appearance, and materials that have a tendency to decay have, wherever possible, been carefully excluded, and the

cost is 3,500/. The new building in Lister Drive will occupy a site of 6,500 square yards; it has a frontage to Lister Drive of 226 feet and lies between the electric generating station and Rowlands's nurseries. The buildings are set back 100 feet from the line of the street, provision being made for one swimming-bath 60 feet by 30 feet, one swimming-bath 75 feet by 35 feet and 27 private baths. Space is also reserved for an additional swimming-bath when required. The estimated cost of the establishment is 24,000/.

### THE IMPERIAL CORONATION BAZAAR IN AID OF THE HOSPITAL FOR SICK CHILDREN.

WE have had the pleasure of inspecting the excellent plans and diagrams of the buildings, stalls, &c., in connection with the Imperial Coronation Bazaar now being held at the Royal Botanical Gardens in aid of the Hospital for Sick Children, Great Ormond Street. The first aim of the designer (Mr. F. W. Speaight) has been to avoid all risk of weather, either from rain or extreme heat. With this view there is erected along the whole length of the Broad Walk a series of white Venetian masts, affixed to which on either side of the walk, at a height of 25 feet, is a lean-to awning extending over a distance of 25 feet. The stalls are erected under this, and they are designed in a simple manner with square green latticework. Attached to each mast is a large flat iron hoop ornamented with a copper heart, and evergreen wreathing, illuminated by many thousands of electric lights, is festooned from mast to mast and from mast to stall. The Bazaar buildings cover an area of 150,000 square feet, and no less than 107,480 square feet of canvas have been utilised.

The great Forecourt is situated in the centre of the Bazaar, and in it will be found the Bandstand, the American Court, and the Court of Five Arches. On either side of the entrance there are the administrative buildings, built after the style of old cottages.

At the Royal Entrance will be found Her Majesty's reception-room and also the Royal Pavilion, both artistically erected by Messrs. Waring, Limited. The whole of the Bazaar buildings have been erected by Messrs. W. Whiteley, Limited.

It may be added that the Hospital for Sick Children is the oldest and largest hospital of the kind in the British Empire, and celebrates its Jubilee this year. It was founded in 1852,

rebuilt in 1872, and enlarged in 1893. The garden and adjoining property was purchased in 1898. There are now 200 beds at Great Ormond Street, besides 50 beds at the Convalescent Branch, Highgate, and 7,000*l.* is required each year to balance accounts, as the expenditure amounts to 19,000*l.* a year while the average income is only 12,000*l.*

### MUNICIPAL ELECTRICAL ASSOCIATION.

THE seventh annual convention of this Association was held last week at the Institution of Mechanical Engineers. Mr. John H. Rider presided. In the course of his presidential address he stated that the Association was now representative of nearly 150 municipalities. In 1895, when it was founded, there were but five electrical street tramways, all, except Blackpool, owned by private companies. At present there were thirty-six owned by municipalities, and sixteen in course of construction. With three exceptions, the whole of those were worked by the trolley system. Overhead construction cost about 5,000*l.* per mile of single track, including rails and paving, while surface contact construction cost 10,500*l.* and conduit construction 13,500*l.* Owing to aesthetic considerations, Washington, Paris, Berlin and other places adopted the conduit system in the centre of the town, with the overhead system outside, and several corporations, including Bournemouth, had done the same thing; but it was really not worth while. It was true that the examples of overhead construction to be seen in several towns in the United Kingdom were anything but pretty, but that was the fault of the designer, and not of the system. It was perfectly easy and practicable to erect an overhead line which would look well in any locality. Neat, and even artistic, work cost very little more than rough and unsightly work. With reference to guard wires, the Board of Trade had recently issued a new set of regulations based practically upon those adopted by the Post Office. In order to hear the views of the various tramway authorities upon those regulations a conference was held on June 20 last at the offices of the Board of Trade. On the advice of the officials of the Post Office and of the National Telephone Company, the Board refused to allow the principles of guard-wire protection to be discussed. Guard wires might be a protection in a few cases, but in the large majority they were the means of causing the very accidents they were intended to avoid. They were a constant trouble to maintain,

and were very liable to break when heavy telegraph or telephone wires fell upon them. The root of the matter was to prohibit entirely uninsulated wires of any kind to cross the trolley wires. If telegraph and telephone wires must be erected overhead, they should only be allowed to cross the streets at right angles, the spans should be kept exceedingly short, and the wires carried as high up as possible, in order that a broken wire might not reach the street. They should be insulated at such crossings, and if guards were insisted upon in addition they should be provided by a netting under the telephone wires, and not over the trolley wires. The recent accidents which had happened in Liverpool and other towns had been caused just as much by the telephone wires as by the trolley wires, but in the mind of the public they were called trolley wire accidents and nothing else. If local authorities would insist that all telephone wires should be placed underground there would be no necessity for guard wires or such unsatisfactory half measures.

In the afternoon visits were paid (alternatively) to the generating station of the Central London Railway at Shepherd's Bush, to the generating station of the Metropolitan Electric Supply Company, Willesden, and to the works of the Incandescent Electric Lamp Company at Wood Green.

Mr. H. Faraday Proctor, city electrical engineer, Bristol, read a paper on "Notes *re* Earthing," in which he took the view that the three-wire distributing systems were chiefly useful when the neutral conductor might be earthed. The neutral conductor of a distributing system from the consumer's and the fire-office point of view should be earthed at as many points as possible; and, where this was done at many points, it was to the advantage of all parties for the current to be alternating. Although troubles might then be experienced if earth-return telephones were used, a state of equi-potential could be most easily arranged for from a transformer-fed system, when no troubles from electrolysis could exist. In the course of the subsequent discussion, Mr. Trotter, of the Board of Trade, said he had been shown a surprising list of towns on the Continent in which there was said to be no insulation at all on the middle wire, and that list went further in his mind to induce him to consider this question carefully than anything that had been brought before him. With regard to the question of how to earth the middle wire the Board of Trade had no regulations about it, but, on the other hand, he frequently told people how generally it was done and how he thought it was best to be done. There should be, in the first place, a resistance as small

as possible, to avoid a "dead short." Then there should be an ammeter, preferably a recording ammeter. Engineers who used recording ammeters found that they greatly assisted the localisation of faults. Lastly, there must be a circuit-breaker, which would give a signal by lamp or bell when it opened. In case of a heavy leak it was better to take the risk of giving a shock to some one on the round "outer" than to have a serious burn-out.

### THE LONDON BUILDING ACT.

AT the South-Western Police Court a decision under the London Building Act respecting the proper thickness of walls was given in a considered judgment by Mr. Rose. Mr. H. Blackburn, a builder, of St. Anne's Gate, S.W., proposed to erect three shops in Norwood, and the district surveyor (Mr. Percy Hunter) objected to the plans on the ground that the builder designed the separation walls which divided the shop proper from the dwelling-rooms above of a thickness of only  $4\frac{1}{2}$  inches. Mr. Blackburn thereupon appealed to the magistrate against the objection under Section 150 of the Building Act. Mr. Hunter argued in support of his objection that the Act prescribed that all walls should be "properly bonded," and that they should be constructed of fire-resisting material; that bricks which were only  $4\frac{1}{2}$  inches thick could not be "properly bonded" because there was no room for cross-bonding, or, in trade parlance, "headers and stretchers;" and that a  $4\frac{1}{2}$ -inch wall would buckle with heat very easily, and so would, in the case of an outbreak of fire, render escape by the staircase almost impossible. The surveyor added that the clause in the Act relating to the thickness of walls was specially inserted as the result of a fatal fire at a shop close to the court, in which, through defective lack of means of egress, some unfortunate girls lost their lives; and he urged that, in view of the recent terrible fire calamity in the City, this clause of the Act should be rigidly enforced. The appellant denied that the Act prescribed any particular thickness. He knew of walls in the Strand which were under 4 inches thick, and were constructed of iron plates and concrete. He argued further that by the decision in the case of *Garrett v. Godson & Co.*, a building which comprised a shop and living rooms for the occupier of the shop was exempted from the provisions of the clause relating to the construction of walls. The magistrate said he accepted the weighty opinion of the surveyor as to the actual construction of the walls, and he therefore held, as a fact, that

a brick wall of only  $4\frac{1}{2}$  inches in thickness could not be said to be a "properly bonded" wall. The point of law, however, which the appellant had raised was difficult and doubtful; and, while he decided that the cited case of *Garrett v. Godson*—which referred to a beerhouse—did not apply in this case, he would be willing, if required, to state a case for the consideration of a superior Court. He dismissed the appeal without costs.

### SANITARY INSPECTORS' CONFERENCE.

THE fifteenth annual conference of the National Union of Sanitary Inspectors has been held at Southport. Mr. Wm. Stansfield, Manchester, presided.

Mr. J. T. Quinton, Liverpool (hon. secretary), submitted the annual report, which congratulated the members on the continued success which had distinguished the work of the union during the year. The addition to the membership roll had been twenty-eight members, two hon. members and one associated member, one associated member having been transferred to the membership list. By death, resignation or compulsory removal from the list owing to the non-payment of subscriptions, they had lost twenty-six members, eight hon. members and one associate. The union now comprised thirty-six hon. members, 339 ordinary members and thirteen associates, or a total of 398. The total last year was 402, so that there had been a slight reduction in the membership. Having regard, however, to the fact that owing to the negotiations for fusion no special effort had been made to increase the membership, and also to the action taken in removing so many members from the roll, the Council was by no means dissatisfied with the slight temporary decrease. On the other hand, the area of membership had been widely increased, no fewer than 180 districts in 30 counties now being represented, as compared with 167 last year. Financially there was a small deficit. In regard to Parliamentary legislation the Council regretted that the introduction of the long-deferred Bill for the codification and unification of the Public Health Acts had again been postponed. The Council trusted that the Public Health Bill, providing for the fixity of tenure and superannuation, which was introduced by their president, might be kept before the House, and that every member of the Union would endeavour to secure the support of his or her local member of Parliament. Premiums in connection with the

Mr. ANDREW WILSON writes as follows:—"The Filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (i.e. germless) water, and thus prevent Typhoid and many other diseases."

THE BERKEFELD FILTER CO. Ltd. 121 OXFORD STREET, LONDON, W.

Northern Sanitary Association prize fund had been awarded to Messrs. W. H. Coney, Wednesbury; R. J. Hughes, Rhyl; C. W. Lasker, Eccles; J. S. Lloyd, Sheffield; and J. A. Priestley, Nelson. The Council regretted they were unable to report in satisfactory terms on the question of the unification of the various associations of sanitary inspectors throughout the country. Some serious misconceptions appeared to pervade the minds of certain members of the Council of the Incorporated Association of Sanitary Inspectors, and until those were removed the Council was of opinion that unity would be impossible. Much useful work had been accomplished during the year, and the Council had every reason to look forward with confidence to the future.

The Chairman proposed the adoption of the report, and remarked that their prospects as a union were brighter than ever, although there had been a slight reduction in the membership. He hoped that members would make an effort to bring up the membership to 500.

#### *The New Factories Act.*

A paper entitled "Recent Factory Legislation, and the Duties of Local Authorities Arising Therefrom," was read by Mr. A. J. Wilde, inspector. He said that the subject dealt with an intricate portion of a sanitary inspector's duties. They all recognised the close connection between health and occupation, and they did not wonder at the heavy toll in sickness and mortality the working classes had to pay through working in vitiated atmospheres, badly ventilated workshops, and under dangerous conditions. The Factory and Workshops Act of 1901 was really a consolidating Act, and consisted of 163 sections, of which comparatively few actually affected the work of the sanitary inspectors. It did not introduce many new features, but it made some provisions compulsory, and therefore it became necessary for sanitary inspectors to make themselves acquainted with the Act. After dealing with the various definitions of the Act, a discussion took place.

Mr. Worrall remarked that if the Act was a consolidated Act, it was an extremely poor one, and made what before was extremely difficult still more complicated.

Mr. Smith (Lancaster) said that a Factory Act of 1902 should be introduced to enable them to understand the Act of 1901.

#### *Standards in Public Health Work.*

A paper on this subject was read by Mr. H. Spears, chief sanitary inspector of West Bromwich. Having defined the

term "Standard," and indicated its present scope as including the various standards set up in Acts of Parliament, model by-laws and regulations relating to public health, and having affirmed the need of standards in general, the writer proceeded to discuss the main essentials of standards as applied to sanitation. It was pointed out that standards could only be applied to men in their social relations, and that they must not be arbitrary in character. Preference was indicated for scientific standards rather than those of the ideal or artistic class, which were exceedingly variable in character. Standards, it was urged, should be definite and quantitative rather than qualitative, national rather than local, and of a progressive type. It was argued further that to secure the possibility of progression they should not be definitely laid down in Acts of Parliament, which were never up to date, but their formation should be entrusted to a single central body, that they should be readily accessible, possess an equal degree of authority, be based on corresponding lines, thoroughly adequate, compulsory in character and ought to be rigidly enforced. It was shown that existing standards were formulated by numerous authorities; that they possessed varying degrees of authoritativeness, were not based on uniform lines, local rather than national, often inaccessible, inadequate, unscientific, indefinite and unprogressive; that while they were by no means exacting, they were largely permissive, and were not rigidly enforced. The only remedy, it was pointed out, was a drastic one, and required that the whole of the existing standards should be put in the melting-pot, so that they might be remoulded once more. To secure the adoption of such reform it was stipulated that a Minister and Board of Health should be appointed, to whom should be transferred all duties now performed by the Local Government Board, the Home Office and the Board of Agriculture, which in any wise affected health, whether in the home or the workshop, and the administration of the Foods and Drugs Act. Also that such Board should, at the earliest possible moment, formulate a new set of standards, which should be absolutely authoritative, but which should be capable of modification from time to time. To secure uniformity of application the author advocated the gradual reduction of the authorities responsible for sanitary administration, until at last one body should be responsible for both formulation and application of standards, a vigorous protest being made as to the inapplicability of the principle of local option to such matters of imperial import as public health.

# The Architect.

## THE WEEK.

A REMARKABLE action relating to architects' fees has just been concluded in Capetown. The plaintiffs, Messrs. ACKERMANN & ADAMSON, sought to recover from the Colonial Government their fees for the preparation of plans for the extension of the Capetown railway station. In 1897 plans and drawings were got out for a scheme that was to cost 170,000*l.* Afterwards they were instructed to prepare plans for a second scheme costing 286,000*l.* The next order was for a scheme costing no less than 1,000,000*l.*; then there was a fourth scheme amounting to 500,000*l.* A sum of 5,000*l.* was paid, and there was a promise of a further sum of 1,250*l.* That was in payment for the last scheme. But a sum of 425*l.* on the first scheme, 1,430*l.* on the second and 12,500*l.* on the third were claimed. The defence was that plaintiffs were not entitled to payment until all the plans and drawings were approved. Those for the first three schemes were not approved, for they were only preliminary plans. The defendants claimed the drawings of the fourth scheme. The plaintiffs expressed their willingness to hand over the drawings when they were paid for the four schemes. They denied that the work was undertaken on approval or that the work was not approved of. Sir JOHN BUCHANAN in giving judgment said it must be considered that there was an implied contract that the plaintiffs would be remunerated for their work. On a *quantum meruit* basis he calculated the value at from 8,000*l.* to 8,500*l.* His brethren, Mr. Justice MAASDORP and Mr. Justice HOPLEY, had arrived at the result in another way, and they had agreed that the estimated value should be taken at 8,500*l.* with an additional amount of 153*l.*, and as 5,000*l.* had been paid on account judgment would be for 3,500*l.* with 153*l.* costs. Mr. Justice MAASDORP thought the plaintiffs might be entitled to further damages; but Mr. Justice HOPLEY believed that all the plaintiffs were entitled to was the amount tendered by the Government and a quarter per cent. on the estimated cost of the first and second schemes, and nothing at all on the third scheme.

THE Land Transfer Acts of 1875 and 1897 relate to the registration of title for the county of London. The County Council had a right to veto the operations, but it was found that seventy-three members were in favour of a general registration of title, while there were only thirty-five opposed to the measure. The whole Metropolitan area on both sides of the Thames is now dealt with. The only part of London in which the Act is not in operation is the City. As the Act is of great public utility, for in three years properties of the total value of 34,907,642*l.* have been placed on the register, the Privy Council made an order that the Act should likewise be applied to the City. The Court of Common Council presented a petition asking for a revocation of the order. A reply has been received stating "Parliament had the fullest cognisance of all these objections, and nevertheless passed the Act without a division, and with a remarkable concurrence of support. The special reasons given for excepting the City from the operation of the Act do not appear to the Lords of the Council to be of serious weight, because, in fact, all of them are applicable to a large part of the area already within the Act. But if the City authorities desire any special provisions to be made for dealing with any of the cases that are peculiar to the City, it is understood that the Lord Chancellor would be willing to consider any arrangements that might be proposed. The date of the commencement of the operation of the order in the City has been postponed repeatedly at the recommendation of the Lord Chancellor, with the result that there has been time for the registry to get into thorough working order, and there is reasonable ground for doubt whether any of the suggested difficulties will arise. The time allowed has not been utilised by the authorities of the City, as the Lord Chancellor had expected, for the purpose of preparing any scheme for working the Act in a way specially convenient for that area. The Lord Chancellor understands that the present situation of the Lands Registry

is not inconvenient to the City. But he has expressed his readiness to consider any representation the City authorities may make to him on this subject." There are of course some valid reasons on the part of the citizens, and especially owing to the complications which arise from the independent ownership of rooms in some of the houses in the City. But the process of registration and mapping in the offices of the Registrar of the Land Registry is so perfect that no case is likely to occur which can be regarded as insurmountable. On account of the complications there is a greater necessity to bring the Act into operation within as well as without the City boundaries.

AMONG the projects which are under the consideration of the Paris Municipal Council is one for the erection of two statues in the Square de Breteuil, the subjects being LIBERAL BRUAND and JULES HARDOUIN-MANSART. BRUAND's name is seldom mentioned, although he prepared the original designs for the Invalides. MANSART's name is, on the contrary, familiar to Frenchmen, and it is surprising that an artist who is so identified with the national architecture should still be without a statue in Paris. One reason may arise from the difficulty of distinguishing between the various members of the family. NICOLAS from an early age was entrusted with great buildings in Paris. One of them was the mansion now used for the Bank of France. He began the great church of Val de Grâce, but the upper part, including the dome, is the work of LE MERCIER. HARDOUIN-MANSART, who was the pupil of BRUAND, was for about thirty years engaged on the works at Versailles. He completed the Invalides with the exception of the dome, which he designed and partly carried out. There was another member of the family, who was engaged on the church of St. Eustache. We presume there can be no objection to statues of the two artists. It is true they were both Royalists, but it would be unfair to make them responsible for the shortcomings of the age in which they lived.

THE Southport Town Council cannot be said to have acted graciously in dealing with a request from the Hon. JOHN COLLIER that the copyright in the picture by him, *In the Venusberg*, purchased for the permanent collection, might be reserved to him. When selling the picture the artist did not assign the copyright to the Corporation, and some lawyers would say it could not therefore belong to them. The request was only acceded to on condition that no reproduction of the picture should be made without the consent of the Corporation. Practically, that kind of concession is not of much use. Publishers who might be disposed to bring out a plate are likely to hesitate when there is even a remote chance of a lawsuit for breach of copyright against them. It was said that the copyright was a valuable asset, and no doubt some members of the Council may imagine that a sum may be paid for the right of reproduction which would materially diminish the taxation. The way the picture is now prized because it is believed to be a source of wealth strongly contrasts with the opposition which was raised when the purchase of *In the Venusberg* was first proposed.

ON Saturday, the 19th inst., Mr. SILVANUS TREVAIL has invited the members of the Devon and Exeter Architectural Society to join in an excursion to Truro and the vicinity. The arrival is timed for 9.36 A.M. In the city there will be visits to the new Carvedras Viaduct, the Waterfall and Victoria Gardens, the Cattle Market, Kenwyn Church, the Museum, the Cathedral, the Municipal Buildings, and various other works. Luncheon will be served at Mr. TREVAIL's house, when the speeches will be restricted to three minutes each. There will be an excursion by steamer to Falmouth, which will occupy an hour. Three-quarters of an hour will be spent in visits to the principal sights in the town, then there will be return by steamer up the river Fal, and the scenery will be observed from different points of view. After landing at Truro Mr. TREVAIL's house will be again visited, and the departure is fixed for 8.3 P.M. The conductor and host is a stickler for time, and by observing his directions a profitable and pleasurable day will be assured.

PAINTERS' ARCHITECTURE: CLAUDE LORRAINE.

## THE IBROX PARK STAND.

WHEN commenting on the accident at Ibrox Park, Glasgow, a week after the collapse of the stand, we said:—"The catastrophe should bring about a revision of the data for calculating the strength of such structures. It is not sufficient to consider a crowd as a dead load, weighing so much per superficial foot. It is evident from what occurred at Ibrox Park that a crowd can become a force which is destructive from its action." That conclusion was corroborated to a remarkable extent at the trial of the contractor. Sir BENJAMIN BAKER in his evidence declared he did not blame the engineers of the structure, for "they applied their knowledge to the best of their ability, but, unfortunately, the only text-books available for them were not up to date." Indeed, all who have any acquaintance with timber construction must have been surprised when it was suddenly announced that the contractor was charged with culpable homicide, on the supposition that he used an inferior quality of yellow pine instead of red pine of the best quality. Every one knows that dangerous consequences may follow from the employment of a piece of timber that is too weak for the work it is expected to perform. But when we find the reporter of the *Glasgow Herald*, in his description of the stand on the day after the accident, stating that the beams "must all have broken about the middle," it became apparent that something more was involved than the character of the timber. Experience does not warrant the belief that a great many pieces of timber will all be defective in exactly the same place, nor, by the law of probabilities, was it likely that several defective pieces would be brought together where the crowd was heaviest. The collapse of several joists in the middle testified to an excessive load, for which sufficient provision was not made.

In such a case an inquiry by specialists should have been immediately ordered by the Government, not only for the purpose of explaining how the collapse was caused, but with a view to the prevention of a recurrence of similar accidents. Some sort of investigation must have taken place, otherwise the contractor would not have been charged with homicide. But it was conducted in secret. Scottish law has its peculiar procedure which is admired in the North, but the English system is preferable in important cases, for if a contractor in Birmingham had to answer a like allegation about an Aston Villa stand there would have been a preparatory sifting of the evidence at the inquest and in the police courts. In that way the responsibility of the different parties would be more clearly apportioned.

The indictment against the contractor resolved itself into three charges, (1) that he failed to erect the timber work in a substantial and tradesmanlike manner, (2) that

he substituted inferior yellow pine for best red pine, and (3) that he placed the bearers and joists all short instead of long and short, or broken-banded. Defendant's counsel took a preparatory objection to the indictment on the plea that the use of yellow pine for red pine must have been known beforehand, and there was really no connection made out which would involve criminal responsibility for the deaths. But Lord KYLLACHY, who presided, would not accept the objections, although he stated the counsel could raise them before the jury.

The history of the contract was set forth by the manager and secretary of the Rangers' Football Club. The ground was reckoned to be sufficiently large to accommodate 80,000 people. But previous to the day of the accident not more than 40,000 persons had been present. Mr. ARCHIBALD LEITCH was asked to prepare the plans for a large stand. Tenders were invited, and six or eight were sent in. Mr. ALEXANDER M'DOUGALL's was the lowest, amounting to 5,280*l*. One of the reasons which led to the acceptance of the tender was an announcement that all timber required for the structure was in stock. The construction of the stand was completed in the spring of 1900. The whole of the woodwork was to be tarred; but there was some unexplained dispute and the joisting was not tarred. In the intervals between the seasons no means were adopted for protecting the stand. During two years and three months the joists were undoubtedly exposed to the action of the inclement and variable Scottish weather. It was also decided to set up a corrugated iron screen, and for that purpose it was necessary to insert a bolt in each of the joists, which presumably diminished their strength. It was at the bolt-hole some of them were fractured. Whether there was any misgiving about the continuous efficiency of the stand is not clear. But in March 1902 Mr. HOLMES, the burgh surveyor of Govan, was asked to report on the condition of the stand. He said, "So far as I am aware the structure has not been crowded to its utmost capacity, but some sections have." That report was submitted to the Scottish Football Association, and it no doubt helped in the selection of the Ibrox ground for the international match. On the fatal day there were no less than 68,114 persons present, and of these over 60,000 must have been on the stand.

Mr. LEITCH, the engineer, said the stands at Ibrox were the largest he had designed. He admitted sanctioning an alteration in the timber. The contractor affirmed he could not readily obtain 8 inch by 3 inch red pine, and asked to substitute 9 inch by 3 inch red pine, and that pitch pine might be employed in the place of red pine. Mr. LEITCH replied he would accept either red pine or pitch pine 9 inches by 3 inches, and pay in proportion. The work had to be performed quickly; two hundred men were

sometimes engaged, and the joists were soon covered up. In the course of the erection numerous instances happened, it was said, of the employment of inferior timber, but the contractor made no objection to the removal of the pieces. Two days after the accident Mr. LEITCH examined the stand, and discovered that "the timber, instead of being either red or pitch pine, was an inferior quality of yellow pine. The joists, in place of running long and short alternately, were all short, and the back joists, which broke, instead of being 9 inches by 3 inches, were 8 inches by 3 inches." Mr. LEITCH said he was satisfied that the cause of the fall was the inferior wood, and he attributed the whole of the disaster to the use of bad timber. In cross-examination Mr. LEITCH admitted that from politic motives, if he had to erect such a stand again, he would alter the arrangement, his meaning being that as public confidence was shaken it might be necessary to do something to give assurance of security. A letter by Mr. LEITCH to the directors, which was written in confidence, relating to the rumour that Mr. JOHN GORDON, architect, was to be appointed to superintend the reconstruction of the stand, was also read. The writer said:—"I suppose I will be the chief witness for the Crown, and if I am to appear as having been thrown overboard by the Rangers' Football Club it will certainly have a disheartening effect upon me and an equally encouraging effect on M'DOUGALL, and you and the other directors know full well that M'DOUGALL will employ every means to blacken and damage my character, as he has already done, and if in this laudable endeavour he is to obtain the assistance of the Rangers, it will be no matter of surprise if the verdict was given in his favour." He also stated that it would be most injurious to the interests of the club if it did anything in any shape or form which could be twisted into a favourable opinion for M'DOUGALL and an unfavourable one for himself.

Testimony was given by Mr. HOGG, C.E., about the joists in seven bays all breaking near the centre of their strain. They were, he said, of a very inferior quality of yellow pine. From his own experiments he ascertained that yellow pine broke down with between one-fourth and one-fifth the weight carried by red pine. But he allowed that if he designed the structure it would have been stronger, for the factor of safety was rather low.

Mr. JOHN GORDON, architect, said he made experiments, and found that while it required 12 tons 16 cwt. to break a joist of red pine, one of yellow pine broke under 2 tons 17 cwt. Allowing eighty spectators to each bay the dead weight would be 5 tons. The three yellow-pine joists in a bay would break under a dead load of 4 tons 5½ cwt., whilst red-pine joists would sustain 19 tons 4 cwt. In cross-examination Mr. GORDON confessed that his tests would have been fairer if the wood used had been subjected to the same conditions as the wood that broke down.

Mr. HOLMES, the burgh surveyor, said he was informed that first-class red pine was to be employed, and on that assumption he approved of the plans. In his inspection he confined his attention to the steel columns. He had no doubt that the cause of the accident was the inferior quality of the wood. He believed five was a good factor of safety for a dead load, and seven for a live load. A competitor for the contract declared that the wood was below what was termed inferior, and was in fact out-classed.

All the witnesses for the prosecution were alike certain about the cause of the accident. They had no hesitation in asserting that the quality of the timber was alone to blame. Yet the burgh surveyor had suggested to the designer the advantages of substituting steel for timber, and the only reply proffered was that as the duration of the lease was only for ten years a permanent structure would be too costly. It was allowed by another witness that he would have made use of a larger amount of timber. Mr. GORDON also said that if he had been constructing the stand he would have doubled the strength of the joisting. It would be interesting to know by what logical process the quality of the wood was arrived at. Professor JOHNSON, of the Washington University, is of opinion that the distinction between pines can only be perceived by microscopic examination, and it was not stated that one of the witnesses had placed a section of wood under a lens. Experience, no doubt, may often serve instead of an elaborate scientific examination. But con-

sidering the number of professors there are in Scotland it would not have been difficult to arrive at some results which would have been more satisfying to architects and engineers than any empiric knowledge.

For the defence, timber merchants and others were forthcoming who declared no less positively that the timber used in the stand was sound and well adapted for its purpose. Indeed, the counsel for the prosecution seemed to have slight faith in his own witnesses, for the strongest point in his address was the neglect of the accused to bring forward evidence about the sources from which the timber was derived, and the prices that were paid for it. Information of that kind would, he said, have ended the controversy at once. But in legal tactics the choice of evidence is left to the lawyers, and an accused person has not much discretion in the matter. It might with as much justice be argued that witnesses did not appear for the prosecution who were prepared to swear that the design of the structure was perfect. It was, in fact, admitted that in the rebuilding increased strength is to be imparted to the structure at an outlay of over 2,000%, which is nearly 40 per cent. of the original cost.

The defence boldly attacked the design. Sir BENJAMIN BAKER, whose name as the designer of the Forth Bridge is authoritative in Scotland, said the usual standard of strength was not given. He would allow for timber a load of only 25 lbs. a square foot instead of the 94 lbs. assumed by Mr. LEITCH and the 80 lbs. by Mr. HOLMES. The stand would safely bear 25 lbs. per square foot, and the crowd probably weighed 75 lbs. per square foot, or nearly three times the safe load. In all his experience he had never seen a structure so dangerously light for the purpose it was to serve. It was on account of the design of the structure that the accident took place, and the yellow pine had nothing to do with it. Sir BENJAMIN would not accept as accurate the figures which are put down in the text-books as marking the differences between the red and yellow pine. They were based, he said, on specimens without any knots. Sir WILLIAM ARROL doubted whether there was practically any margin of safety allowed. Mr. CARL BONN, who had charge of the structural part of the Glasgow Exhibition, analysed the formation of the stand more closely than any of the other witnesses. He ascribed the cause of the accident to the want of strength in the joisting. The substitution of yellow pine had nothing to do with the accident; the wood was of very good quality. The stand as designed could only sustain a load of 26 lbs. per square foot, and it ought to be equal to 190 lbs. There should have been six times as many joists if the structure were protected, and nine times as many if it were exposed to the weather. The tests made for the prosecution were also described as unscientific.

It would be impossible for any ordinary jury, after hearing statements so confidently expressed on both sides, to be certain about the real cause of the disaster. Doubts must have been excited in their minds, and under the circumstances they could hardly fail to give the accused the benefit of them. The opinion of experts is likely to be divided on the subject. On that account it is to be regretted that an official examination of the stand was not undertaken by command of the Government. Men in Glasgow may be more hazardous in dealing with timber than men elsewhere. It will be remembered that some years ago a new play-shed in the yard of a Board school collapsed, killing or maiming a large number of little children who had gone there for shelter. The data relied on in that case by the architects may also have served for the structure in Ibrox Park, and what guarantee is there that figures of a different kind will be henceforth substituted?

It should be borne in mind by designers that the experiments on timber cannot have the precision of those on steel and iron. Uniformity is so rare, it seems useless to be piling up a variety of results. BAUSCHINGER, who devoted his life to the strength of materials used in construction, made very few experiments on timber. Until the United States Government tests are complete, there will not be sufficient results obtainable to be a guide to practice. Many thousands of experiments have been already conducted, but the officials will not arrive at any positive conclusions for the present. In one of the statements relating to pine it is said:—"The variation in

strength, as will be seen from the tables, in wood of the virgin forest is in some species so great that by proper inspection and selection values differing by 25 to 50 per cent. may be obtained from different parts of the same tree, and values differing 100 to 200 per cent. within the same species. These differences have all their definite recognisable causes, to find and formulate which is the final aim of these investigations." To say, then, that red pine has a transverse strength of 1,535 lbs., while yellow pine is 1,185 lbs., as in the table books, is to give an illusion of constancy to a material which continually varies. Wood is an organic substance; or, as the United States specialist, Mr. ROTH, says:—"It is a structure just as much as a railroad bridge or a balloon frame, and as such varies greatly even in the wood of the same tree, nay even of the same year's growth of the same cross-section of a log." Where so much is doubtful it is dangerous to be dogmatic, and one effect of the M'DOUGALL trial we hope will be to persuade practical men to be cautious not only in depending on timber, but in making assertions about its qualities. When they have to employ it largely in structures there is sure to be risks in any excess of economy. It should be a rule to use the material with dimensions that will allow of contingencies, or not at all.

### THE ENCYCLOPÆDIA BRITANNICA.\*

FROM the time of the first encyclopædia objections have been raised against the alphabetical arrangement. COLERIDGE, as became a philosopher who was always insisting on method, sketched the plan of the "Encyclopædia Metropolitana," which was to obviate the inconvenience which was assumed to be inherent in all other works of the class. Without discussing the important question which is involved in the construction of encyclopædias, there is no doubt that students of technical subjects find a pleasure when in more miscellaneous articles they meet with information which they did not anticipate. It corresponds with that unexpected delight in music or pictures on which Mr. HERBERT SPENCER has laid emphasis, and which he maintains is the most enjoyable. On that account the interest for a particular class of readers in the volumes of the "Encyclopædia Britannica" is not confined to the special and comprehensive treatises which are one of the characteristics of the work, and were prepared for their benefit.

The prefatory essay to the third volume, by Dr. H. S. WILLIAMS, on "The Influence of Modern Research on the Scope of World History," has, for example, much which is interesting to all who study art. Lord BYRON was indignant with the Government of the time for purchasing the Elgin Marbles. They were then regarded merely as pieces of sculpture which were inferior in value to the *Apollon Belvidere*, but which conjointly might act as a substitute for that unattainable figure. They were supposed to be adapted for pleasing people who were never likely to be enthusiastic about art. There can be no doubt the Parthenon sculpture has rendered invaluable service in elevating English taste, but now and henceforth it can serve a new office as an exponent of evolution. Dr. WILLIAMS, after describing LAVARD'S discoveries at Nineveh, which added an Assyrian room to the British Museum, says:—

If we would judge how direct and unequivocal was the impulse which the dying nation transferred to the adolescent one in point of art, we have but to take a few steps in the British Museum, from the Assyrian room to the wonderful hall that holds Lord Elgin's trophies from the desecrated Parthenon. Look, then, upon the frieze of bas-relief that bears the magic name of Phidias. If anything can reconcile us to the act that deprived Greece of her priceless heirlooms, it is the fact that they have found lodgment here close to their Oriental prototypes, where half a million visitors each year may at least have an opportunity to learn the lesson that human progress is an accretion, a growth, a building upon foundations; and, specifically, that Greek art, no less than

other forms of human culture, was an evolution, and not an isolated miracle. For what is the Parthenon frieze, as we now come to it fresh from the palaces of Nineveh, but an Assyrian frieze adapted to the needs and ideals of another race and developed by the genius of a newer civilisation? The profiled figures in low relief coursing together, are they different in conception from the profile figures of the palaces we have just left? The horses of the Parthenon frieze might almost seem to have stepped bodily from the palaces of Assur-bani-pal. They have gained something in suppleness of limb, have altered their attitude in a measure, to be sure, thanks to their new environment. But their type has not changed by so much as an actual breed of horses might be changed in as many generations. Note the head, the most typical and characteristic feature of this Grecian steed. Line for line it is the same head, trappings aside, that we have just seen at Nineveh. Even the defects of the Assyrian drawing are there—the too small and slender face and receding lower jaw, the tiny ear, the far too full and "chuffy" neck. Possibly no horse in nature was ever like this, but the Assyrian artist so conceives it; the Greek copies that conception; and the distorted type will be transmitted down the generations to the Italian of the Renaissance, to the classical painters of Spain, the Netherlands, and Germany and France, nay, even to the artist of the nineteenth century. The court artist of an Oriental prince of the ninth or tenth century B.C. conceives a certain ideal; and, following him, a certain type of sculptured horse, such as the artist who carved it has never seen, steps before the chariots on Napoleon's Arc de Triomphe in nineteenth-century Paris.

A passage of this kind does not become less effective because we find it in an article that mainly relates to Biblical chronology. Evolution in art is again considered under the head of Egyptology. By means of modern research it is possible to ascend to a period about 7,000 years B.C., when there was a change in the climate of Egypt. We can realise the forms of the emigrants of that time, when women with the lower jaw covered with hair were accepted as beautiful. Through art much is ascertained about the succeeding races and their rulers. The advancement of knowledge is suggested when it is said that in 1880 an article appeared on the subject in the ninth edition of the "Encyclopædia" revealing that scarcely anything was known about the age of Egyptian products. Now the date of an object has become as important almost as its form. The character of Egyptian architecture has long been established, and probably no exploration will increase our acquaintance with it. But in the article on the Coptic Church there is a suggestion that the native style was not without its influence on the buildings for the creed. The basilica type was imitated, but we are told "the use of the dome by Coptic architects is almost universal, and nearly every church has at least three domes overshadowing the three altars. The domes are sometimes lighted by small windows, but the walls are windowless and the churches consequently gloomy." The domes no doubt were inspired by Eastern traditions rather than Roman examples.

It is a wide jump from Egypt to modern copyright regulations, but an artist has nowadays to be conversant with strange transitions. Mr. E. BALE treats of some of the anomalies of existing legislation through which artists suffer. One is the belief that by receiving a docket of registration on payment of a shilling at Stationers' Hall copyright is reserved to the artist; but as it belongs to the purchaser of a picture or a statue, only by a transference from him can copyright be obtained by the producer of the work. The chief obstacle to an amendment of the law arises from photographs, although it is at present doubtful to what extent photographers are secured.

In cases of copyright labour seeks protection, and is allowed it because of its exceptional character. Ordinary labour does not, however, obtain any special care, and consequently the so-called craftsmen have of late endeavoured to gain a footing corresponding with that of privileged artists. In that way there is a contrast between modern and Mediæval times, and the subject is one which concerns the sociology of the future. The article by Professor HEWINS on "Economics" will reveal to many who have not bestowed attention on the matter that what CARLYLE called the Dismal Science has ceased to be regarded as if it were an inevitable law of nature. In any new arrangements all bearings of the labour question will have to be made the object of more sympathetic consideration than formerly. Under existing

\* The new volumes of the *Encyclopædia Britannica*, constituting, in combination with the existing volumes of the ninth edition, the tenth edition of that work, and also supplying a new, distinctive and independent library of reference dealing with recent events and developments. The third of the new volumes, being Volume XXVII. of the complete work. (Published by *The Times*, London.)

conditions it is quite possible for a man to conduct a business with profit to himself, who has no knowledge of it and could not perform any of the operations. His thoughts are concentrated on profit and loss, and in the organisation of which he is the head, he thinks compensations somehow arise from any absence of capability in his workmen. Labour, in fact, is supposed to be only a temporary and costly substitute for machinery. However, as the Professor says:—"In our own day labour disputes can scarcely ever be resolved into a question of merely pecuniary gain or loss. The significance of the amount of money involved varies greatly for different trades, and can only be understood by reference to the character and habits of the people concerned. But questions of sentiment, shop feeling and trade customs invariably play an important part." It was on account of the admission of feeling as a factor in his system of political economy that JOHN STUART MILL was treated with some forbearance by RUSKIN in "Unto This Last" and other daring books. It is a question which cannot be ignored as it has been, and a comparison of the various articles on Economics in the "Encyclopædia" is sufficient to demonstrate the trend of thought from the end of the eighteenth century until our time.

The article on Contract, by Sir FREDERICK POLLOCK, shows his customary skill in making abstruse subjects easy of comprehension by readers who are not initiated in the mysteries of legal phraseology. *Assumpsit*, which as a species of contract is a form of action peculiarly British, is a substitute for the old wager of law. The following explanation of its origin is readily understood:—

I profess to be a competent builder; you employ me to build a house and I scamp the work so that the house is not fit to live in. An action on the case was allowed without much difficulty for such defaults. The next step, and a long one, was to provide for total failure to perform. The builder, instead of doing bad work, does nothing at all within the time agreed upon for completing the house. Can it be said that he has done a wrong? At first the judges felt bound to hold that this was going too far, but suitors anxious to have the benefits of the king's justice persevered, and in the course of the fifteenth century the new form of action, called "assumpsit" from the statement of the defendant's undertaking on which it was founded, was allowed as a remedy for non-performance as well as for faulty performance. Being an action for damages, and not for a certain amount, it escaped the strict rules of proof which applied to the old action of debt; being in form for a kind of trespass, and thus a privileged appeal to the king to do right for a breach of his peace; it escaped likewise the risk of the defendant clearing himself by oath according to the ancient popular procedure. Hence, as time went on, suitors were emboldened to use "assumpsit" as an alternative for debt, though it had been introduced only for cases where there was no other remedy. By the end of the sixteenth century they got their way, and it became a settled doctrine that the existence of a debt was enough for the court to presume an undertaking to pay it.

The most important article relating to construction in the third volume is Mr. WHATELY ELIOT's on Docks. The majority of the dry docks for the United States Government have been hitherto made of timber. With so large a supply of material at hand that course was to be expected. Commodore ENDICOTT holds that timber is unfitted for docks which are to accommodate the large vessels now built, and he recommends that new docks should be formed of masonry and concrete combined. The London County Council will pretend to be surprised when they learn that he further advises that instead of being constructed by day labour and by Government employés, "they should be carried out by contract, which would be the means of greatly reducing their cost." The allied subject of Dockyards is also treated. Large sums of money are now being expended in order that those important aids to defence may be efficient. In the article on Earthquakes advice is given about the construction of buildings which will withstand the movements.

The articles we have referred to deal with topics that can be looked upon as colossal. In the same volume there are, however, a great many biographies of artists. SIDNEY COOPER is one of them. COROT, the French landscape-painter, is noticed at greater length. Although he was supposed to be original in his treatment of nature, he is described as being more traditional than is believed, and some of his trees are stated to resemble CLAUDE's.

COURBET, it is prophesied, will be remembered as a landscape and sea-painter instead of by his realistic canvases. It is remarked of P. J. CLAYS, the Belgian painter, that he was "the first to appreciate the beauty of calm waters reflecting the slow procession of clouds, the glories of sunset illuminating the sails of ships or gilding the tarred sides of heavy fishing-boats. He painted the peaceful life of rivers, the poetry of wide estuaries, the regulated stir of roadsteads and ports." We are told that whenever DAUBIGNY liked his pictures, he added another duck or two to those introduced, so that the number of ducks often indicates greater or less artistic quality in his pictures. His own experience confirmed his saying that the best works do not sell. Illustrations are given of those painters' works as well as of the *Danseuse*, by DEGAS, and *The Dream*, by DETAILLE. GEORGE DU MAURIER forms the material of an article of more than average length.

If considered as a record of what has taken place in all departments of investigation, the third volume corresponds with its predecessors and enables a more exact notion to be formed of what the tenth edition will be when it is completed. From the arrangements which have been made it is now evident that the end will be reached in a shorter time than was anticipated, and the work will thus form a unique example of expedition, accuracy and completeness.

#### A TALK ON SKETCHING.\*

WHEN the harness is off, every man instinctively goes his own way to his garden, his fishing, his courting—or, well, I go to my sketching. In the Old Country it used to be among the old churches and abbeys, the delightful country houses, the ruins rich with a thousand ancient memories, and moss-grown spots beautiful with historic stories. The old spots—ah, it is all so new in Australia—the newness—well, it has its charm—the charm that the explorer feels when he seeks to penetrate into the mists that lie beyond. But the old times will come back when, with pencil and brush, we sought for colour amid the old grey stones, and with ponderous keys unlocked the doors of crumbling shrines to gaze upon the monuments of ancient warrior and touch the brassy hand of ancient sage. There is the prevailing note of the old country and the prevailing note of the new, and it has been our privilege to touch them both. Both alike charming and intensely interesting, yet widely separated by seas, climate and history. One cannot get outside one's office in England with a sketch-book without touching something of historic interest. All the nomads who write books of their wandering fill them with historic peeps; it must be so, for all the cities and all the country are filled with the works and memories of our ancient fathers, and it is all so closely packed, so full that one need not go very far afield for subject, and then we have the rich legacy of art, left by so many generations, as well as the inspiring company of men who gather in art clubs and societies like minded with the sketcher and the artist. My sketching, I am afraid, has been the somewhat fragmentary efforts snatched in all too short spare hours from a busy life, but I have been consistent to my school-boy love right along, and hope to woo her many times again, to ask under the changing skies and by the running waters the hidden secrets of nature's expression, and to know the joy of her telling. In a short paper there is not space wherein to say much that would be reminiscent of one's sketching experiences, but naturally in the course of somewhat varied trips, there are thoughts evolved and convictions consolidated that produce ideas to rub against other men's ideas, that may be of some value to our younger members. If a man loves drawing he will draw, and if he does not he will not take the trouble to learn, and that will be his loss; but every man to his own way, and I speak to architects, whose natural expression is by drawing, the universal language in which we may consolidate our ideas, and in which we speak, even though our tongues know not the cunning of words, or the language of our foreign brethren—a language as ancient as the scratchings of prehistoric man upon the rocks and bones that mark the spot of his dwelling, and the language of countless artists and mighty people who have left their indelible carvings to remain while they themselves have centuries since mouldered to their original dust.

It is well, perhaps, to fix our thoughts under a few headings, and, first, as to

*Mediums of Expression.*—From temperament and from education will grow a man's medium in which he seeks to

\* A paper read before the Royal Victorian Institute of Architects on April 29 by Mr. Robert J. Haddon, F.R.V.I.A., F.S.A.I.A., Lecturer on Architecture, and published in the *Australian Builder*.

portray the subject matter before him, and just as one man from a bundle of pens upon the writing-table will choose his own nib, be it either fine, ball pointed, or broad, so the artist will choose the tools and substances best suited to his own feeling. The architect is invariably good with his pencil, and, speaking generally, may be relied upon for good perspective and good drawing; his weakness and his strength is inclined to detail, showing too much, overloading the picture with what his brain tells him really is there, rather than confining his attention to that which he sees. Being in his everyday work constantly engaged with the conventional drawing of line, his eyes see lines in nature where the ordinary trained artist sees mass only. This appreciation of line as line is an extremely fascinating study, but may be carried too far, for, after all, nearly all open-air objects are made up not of lines, but of mosaic-like masses of colour and form, but may be confined by lines if you will, but one better expressed by colour or washed masses or shading. A short pencil is the best, for it is more under control than a long one, nearer the tips of the fingers that answer to the will, and hence reduces the mechanical to a minimum of the feeling to the quickest means of expression. But the pencil has its limits, as has all mediums; soon we are impressed with the dignity and value of shadow masses, and then we find the need of shading. Then our pencil drawings are liable to damage by smearing, and we seek ink and pen, and a new world opens up to the sketcher. For rapidity in outdoor work he soon finds the need of the brush, and then monochrome claims him till such time as colour, the greatest of all mediums, holds him for a devotee, and from this last and greatest I question whether there is any turning back, for colour, apart from form, has its charm, and when the two are combined in happy unison, who, with the artist's eye, can resist their engaging charm? And now a few words as to

*Style.*—Style is a term hard to define. It is, however, a quality that is apparent to the cultured observer of any man's work worth the notice. Every man is in a very true sense "a part of all that he has known," and as an absorbing medium he is ever taking in (consciously and unceasingly) impressions, from the time of his early drawing lessons at school, through his office career, to long years of practice, and the quality of the man will, yea, must regulate the ultimate style of his work, and just as surely as nature has made the red flowers as distinctive from the yellow buds, and the slow-growing oak from the rapid-growing elm, so surely has each man his own peculiar quality to appreciate one kind of subject or one style of expression as distinctive from another. We have only to think for a moment of our own circle of friends and know this. One man sees the comic, the ludicrous, has a keen appreciation of the funny things of life; he has the more intent eye to catch the humorous incidents that cross his path, and if there be added to this gift the power of the draughtsman, happy is he in his work, and thrice happy his friends, who are through his gifts made partakers of his humours. Gentlemen, we cannot all be forced into the same mould and stamped off with the same die, and education everywhere is recognising this more and more in its methods of to-day, greatly, one cannot help seeing, to the progress and benefit of the rising generation. In this thought we are at the heart of nature and at the fountain-head of wisdom, where many of the vexed problems of our everyday vexing civilisation find answer. There is work for all, a place for each man's gifts, a mutual ground on which we each may appreciate the other's qualities, be they only in earnest, for outside the earnest seeker I have nothing to say. Some artists portray whatever they see with infinite pains and tiny details and exquisite finish, and enjoy those subjects that bring out in greatest relief these qualities; they delight in showing every leaf and berry on the trees, and each subtle part of the subject. Just as one man feels most at home among trees and pasture subjects, or among cattle and farmyard life, or in distinctly architectural subjects, so each man is invariably being impressed by one kind of subject more than another, and one aspect of nature more than another, the more often perhaps that which he likes best; consequently style is built up, partly through his temperament and partly by his love of particular and peculiar subjects. Personally, I must confess to a very growing love for the waters of river and sea-shore since I left the old buildings in old England. I love the sea in her deep blue vastness, her shallow greenness, her moving, minnowed bosom, her sand-girt and rock-bound shores, her spirit of lonely and eternal solitude and the skies that no smoke of grimy town dimmed atmospheres blot out; where nature is alone, save for the ships that cut the blue and sail on and on with our thoughts to their mysterious havens. Yacht and pinnace and gig and river ports and stately ships, side by side with battered hulks, have claimed my colour box more often than I can tell, and in them I see infinite variety of form, colour, movement, light and shade.

*Methods of Work.*—There are many things to say, and so many ways of going to work. Being a disciple of method and

order, I believe in a light, practical equipment, embracing all one is likely to need, yet small in compass and portable in bulk; and first a stool should be carried, one of the collapsible kind, for it very seldom happens that a seat is available at just the right point of view for the proposed sketch, and to sit upon the ground takes the eye too low, and has other disadvantages, to say nothing of possible chills. A colour box, charged with moist colours not too numerous and with good palette space, a water dipper and three good sable brushes, with a small bottle of water. Then for pencils—a H. and a B.B. are to my mind the best, but that is purely fancy, and a block (Whatman's)—that is also fancy; some prefer a book. Then a leather-covered portfolio to hold block and loose sketches, and a sheet of blotting-paper, and the sketcher is equipped. But stay, I may mention the friendly pipe, for sketchers, like fishers, love the weed, and I was about to add, a good companion; but that is in some ways a doubtful addition, as no two fellows light upon the same subject, which fact is somewhat inclined to test the ties of friendship when sketchers go together. Better to mutually agree to visit a certain locality, and after work arrange to meet and compare notes and sketches. Some sketchers' methods are like themselves, full of art and untidiness. One fellow, a good artist, who was one of a party I joined not long ago, turned out his gear when we arrived at a likely spot—a small battered cardboard box, about seven small pieces of hard, cake colours, one old brush, one common table plate, wrapped up in brown paper, two scraps of paper, that was all. Some prefer the wet method. I must say I do not, for if the paper is too wet one cannot get the work down quick enough—an all-important item in outdoor sketching, where the effects of nature are for ever changing. Most fellows I have known, and I have been out with a good many, wander about a good deal and wait for an inspiration. I find the architectural training comes in here. We have to plunge in at our work, and let the mood come after, and really it is quite wonderful how interested one does get after one has got over the first few minutes of the start, and inspiration comes in due course. In life-class sketching, rapidity of execution is very necessary, as the model can only pose for a short time in one position, and the hand must be sure of the stroke and the eye of the line. In sketching buildings, details of museum subjects, old furniture, brasses, antiques, carvings, &c., one can take full time and return again and again, and the architect may well add the measuring tape and rule to his equipment. In conclusion, one is reminded of the twofold side of a man's nature, and especially of the nature of the true architect, who should also be the true artist, the practical and constructive and directive and organising side, and the side of dreams, impressions and inspirations; no man who has enriched the world with the monuments of the greatest art, be it architecture, sculpture or painting, or the lesser arts that hover around the greater, but has been a dreamer of dreams, a-seeking amid the fields of nature, life and art for true and inspiring note of colour and form, if happily he may find them; and adding his own ego to that he knows, thus enters into the labours of those whose works remain a lasting influence for truth, for beauty and for art. Our complex city life is oftentimes too hard, too cutting; we need the relaxation of some hobby, and such a relaxation is sketching. If we seek outdoor nature, happy are we in the ever-changing beauties of sky and river and landscape, the rosy dawn, the effulgent day of these southern skies, the half twilight of dreams—dreams that make us strong, strong in the true impression, strong to pursue art and seek her whose reward is more than gold, and whose riches are brighter than the lustre of gems.

## TESSERÆ.

### The Clarendon Picture Gallery.

THE great mansion in Piccadilly erected by the first Earl of Clarendon was one of the sights of London in the seventeenth century. At the same time it created a host of enemies for the statesman, for it was believed to be erected by money stolen from the State, and it was called "Dunkirk Hall," "Tangier Hall," &c. In it was a marvellous collection of portraits representing, as John Evelyn wrote, "the former and present age." For there were the pictures of Fisher, Fox, Sir Thomas More, Tho. Lord Cromwell, Dr. Nowel, &c. And what was most agreeable to his Lordship's general humour, old Chaucer, Shakespeare, Beaumont and Fletcher, who were both in one piece, Spencer, Mr. Waller, Cowley, Hudibras which last he plac'd in the roome where he vs'd to eate and dine in publick." Many of the portraits which Lord Clarendon possessed were presents—or rather bribes, if we are to believe Lord Dartmouth, the annotator of Burnet, whose means of information cannot be disputed. Clarendon House was, it is said, chiefly furnished with the goods of cavaliers brought as "peace-offerings" to the omnipotent and ambitious Chancellor

In no other way can the formation in less than seven years of this extensive gallery be accounted for. So many fine family portraits as Clarendon possessed could not be purchased. When his taste was known there were many to pay court to the great minister by the present of a portrait. That noble picture by Vandyke of the "Earl of Derby, Countess and Child," was doubtless a peace-offering from the noble house of Stanley, and others might be named as presents, "most agreeable," to use the words of Evelyn, "to his Lordship's general humour." When in 1675 Clarendon House in Piccadilly was pulled down, the pictures with which it was so "bravely furnished" were removed to Cornbury House, in Oxfordshire, the seat of the Chancellor's son, then the second Earl of Clarendon. The second Earl would seem to have cared very little about portraits. He inherited neither his father's talents nor his general humour for collecting the faces of great men. He knew the money value, however, of what he had, and was with difficulty induced to allow Lord Paulet to take copies of his grandfather's and grandmother's pictures by Vandyke, because, as he alleged with some reason, copies would lessen the value of the originals. This unwillingness has been condemned somewhat severely by Lord Dartmouth. But was Lord Clarendon altogether his own master? Were the pictures entirely his? There is reason to think not. His father left him encumbered with debt; his own extravagances added to his difficulties, and fifty-eight pictures, including seventeen whole-lengths, were seized "at the suit of John Taylor, gentleman," for a debt of £1,200, and twenty pictures and 6,350 volumes were lost at the suit of William Fallman, for a debt of 800%. These seizures were effected in 1694. The history of the collection after leaving Cornbury House is as follows:—At Lord Hyde's death in 1753 the pictures were divided; the Duchess of Queensberry got one portion, which she removed to Amesbury, in Wiltshire, and the other half became the property of the Hon. Thomas Villiers, the first Earl of Clarendon of the present creation. The Queensberry portion passed in 1810 at the death of the last Duke of Queensberry, "old Q.," as he was called, to Lord Douglas, by whom they were removed from Amesbury, Petersham and Piccadilly to Bothwell Castle in Lanarkshire.

#### Painters' Architecture.

Many of the great masters of the Renaissance, Leonardo da Vinci, Michel Angelo, Raphael, Giulio Romano, and others, were architects as well as painters, and several buildings were executed after their designs and under their inspection. We can also consider architecture as it appears in pictures, and mixed with other objects. Among the great artists Raphael is the only one who has left a number of historical compositions in which buildings and architecture form so principal a part as may enable us to form a judgment of the result of the whole. The general character of his architecture, like that of his figures, is a sedate and simple grandeur, equally free from superfluous ornament and from strongly-marked contrasts. Neither in his works nor those of his followers shall we find many instances of those singular effects of perspective, of those groups and clusters of buildings crossing each other in various directions, of those splendid artifices which may be called the picturesque of regular and entire architecture, in contradistinction to ruins. The landscape-painter can make use of ruins of every kind without scruple and without much danger of impropriety; but history-painters are more confined, for there are, comparatively speaking, but few historical subjects where a background of ruins would be strictly proper. As they are therefore in some degree precluded from buildings in their most picturesque state (that is, where the variety of forms, tints and effects are most sudden and striking), those painters who were fond of such varieties and of all that is termed picturesque have fought for them by means not incompatible with what is due to the dignity and propriety of the historical style. This will clearly appear to any person who compares the architectural backgrounds of such artists with those of other masters who studied the higher parts of the art; as, for instance, the backgrounds of Raphael and Poussin with those of Paul Veronese and Rubens. In the works of the two last-mentioned painters those artifices and that picturesque disposition appear in all their brilliancy, and are perfectly suited to what has very properly been termed the ornamental style, as opposed to the severer character of the Roman and Florentine schools.

#### Architectural Qualities.

The emotions aroused in the mind of an intelligent expert by the contemplation of a work of pure architecture, in whatever style and of whatever race, are necessarily complex and difficult to describe; but the quality and keenness and scope of these emotions are such as have been awakened by no other of the fine arts. To the "capable eye" there is, in the first place, the charm of repose, which includes almost all the virtues of design. Then follow the gracious and caressing

appeal of technical harmony and grace in outline and proportion, in symmetry or balance of parts, in colour, texture, detail and distribution of ornament; the pleasing evidences of scholarship without pedantry; if the work is modern, of the intelligent study and adaptation of historical styles to modern use; of reserved power, of the absence of affectation or caprice; the just subordination of the personality of the author to his theme; the skilful adjustment of means to ends; the perfect agreement between construction and decoration; and, in certain cases, the glad recognition of the audacity of genius in breaking through the trammels of convention and creating a surprise which does not offend. In the second place, outside of technique, the student is moved in the contemplation of an historical monument by its poetic suggestions; by the effect of national or local spirit on the treatment of outline and detail, and of that unconscious but inevitable imprint made by contemporaneous political, religious, social, or commercial conditions, which differentiates an architectural achievement from any other work of fine art, and makes it an evidence in the history of civilisation. He has learned that the architectural monument is saturated with humanity; that it contains the essential spirit of history; and that even a Grecian Ionic capital, for instance, the decoration of a Roman frieze, of a Gothic spandrel or capital, or of the panel of an Italian pilaster of the fifteenth century, is a highly figurative image of a phase of civilisation.

#### Egyptian Proportions.

At Ombos, Lepsius the explorer was fortunate in discovering a third canon of proportions for the human body, which differs very positively from both the older Egyptian ones. The second canon is closely related to the first and oldest—of the age of the Pyramids—which, indeed, it merely carries further out, and applies with certain differences. Of both the foot, as unit, is the basis; and this, multiplied by six, corresponded with the height of the erect body; but it must always be observed, from the sole, not to the crown of the head, but only to the height of the brow. The space between the roots of the hair, or the height of the forehead and the crown, was not taken into account; and is sometimes three-quarters, sometimes half, now and then even less than this fraction of another degree. The difference between the first and second canon lies chiefly in the place of the knee. But in the Ptolemaic canon the division itself was wholly altered. The body was no longer divided, as in the second canon, into 18, but into  $21\frac{1}{2}$  parts, to the height of the brow, or into 23, including the crown. This is the division given by Diodorus in the last chapter of his first Book. The midway point between forehead and sole falls in all three systems below the pubis. From thence downwards, the proportions of the second and third canon remain the same, while those of the upper part of the body, on the contrary, vary essentially; the head is larger, the breast descends, the umbilical point rises. On the whole, the contours are more redundant, and that beautiful antique simplicity and chasteness of form in which the grandeur of style as well as its peculiarly Egyptian character lay, is abandoned for an imperfect imitation of a foreign and ill-understood style of art. The relation of the foot to the height of the body is still preserved; but here the foot as the unit no longer forms its normal foundation.

#### Position of Works of Art.

To judge fairly of art, it should be seen at home, that is, in exactly the spot and under the circumstances for which it was made, otherwise we may go away not only with wrong impressions of the artist but with a wrong lesson to ourselves. It is of importance, too, that a lover of art should know himself the conditions necessary for best exhibiting its works; these may be termed the truths of adaption. A little experience and study of the effects of light and shadow will solve any difficulties of this nature, keeping in view the art-idea. That which is made to be seen near to should not be placed above and out of sight, as are the best statues of the Milan Cathedral; nor that which should be seen above, as was intended Michel Angelo's Moses, be placed on a level with our eyes. No artist suffers more from misplacement than Michel Angelo. Position to him is all important to render his designs effective. His defective drawing, exaggerated anatomy and harsh colouring, seen at the distance intended by him, lose much of their unnatural character; yet, unlike the best works of Greece, there is in him more that is monstrous than truly grand in style, made worse often by being studied at 10 feet off, when intended to have been seen only at 50. The finish and proportion of parts depend greatly upon the distance and elevation for which they are intended. If the eye is puzzled or wearied in reading sculpture, or distracted to parts, it is a sign that it is either wrongly placed or over-finished in detail. Ornament is worse than useless that does not correctly meet the vision; its whole purpose is lost, and the artist has thrown his power to the winds.

## NOTES AND COMMENTS.

It is a common complaint with builders, especially with those who undertake alterations in houses, that many articles are supplied by their clients, and which it is understood are to be fixed or adapted at little or no expense. This is only one form of a general endeavour among people to get rid of what is known as intermediate profit. So many announcements are made of wholesale manufacturers being willing to trade directly with individual consumers, it is not surprising that people should imagine it is easy to purchase large and small articles at trade price. In such instances the purchasers are not always as satisfied as the vendors. A case was heard a few days ago in the City of London Court, before Judge LUMLEY SMITH, which reveals the lengths to which people will go in their anxiety to obtain trade discount. Messrs. EWART & SON, LTD., sought to recover 7*l.* 11*s.* 6*d.*, the balance of a debt of 28*l.* It appears that in November last a man who described himself as an engineer called at the premises of the firm to select a geyser. He was asked for his trade card, but said he did not bring it with him. A formal letter was sent to him quoting a price for providing and fixing a geyser. Some days afterwards another man called in search of a geyser, and chose one, as well as a bath, and gave instructions for them to be fitted in his house. After the work was done, caller No. 1 made a request for the account, and he was informed that it was sent to caller No. 2, for it was not supposed there was any connection between them. Whereupon No. 1, the "engineer," told the firm that what they had done was anything but a proper proceeding. The man who obtained the bath is a member of a firm in the East-end, and the engineer is a person who looks after the engines on the premises. Bath and geyser were set up in a private house; 20*l.* 10*s.* was after much correspondence paid, but it was necessary to take an action to recover the remaining 7*l.* 11*s.* 6*d.* The judge said that discount was reserved for the trade. A man who wants a bath put in goes to a builder, and the builder goes to the man who makes the bath and gets the trade discount. It is the same with engineers, but in this instance the so-called engineer was not an engineer in an ordinary sense, but simply poked a fire. His Honour accordingly left the case to the jury, and it is needless to say they found for the plaintiffs with costs. Messrs. EWART have made other people besides builders their debtors by their bold stand, and we hope the issue of the trial will be a warning to people who are constantly scheming to get discounts under false pretences.

ALTHOUGH every architect who has visited Venice must have misgivings about the stability of the foundations on which Venetian structures stand, few could have anticipated that the Campanile in the Piazza of St. Mark, which was a prominent feature in most views of the city, was doomed to collapse on last Monday morning. On Sunday the Prefect of Venice informed the Italian Minister of Public Instruction about the appearance of a crack on one of the sides. Experts were at once despatched from Rome, but their services were not required. The downfall had taken place. The marvel is that in falling so little damage was caused to the neighbouring structures, St. Mark's and the Doges' Palace, with other buildings, which are in the vicinity. But the materials appear to have descended as if they were still under static laws and must keep together as much as possible. The admired Loggia of SANSOVINO, which stood at the base, was therefore crushed, for it had to resist nearly the whole weight of the structure. It is generally accepted that the foundations were commenced by PIETRO TRIBUNO, but that the walls were owing to the Doge DOMENICO MOROSINI, who reigned in the middle of the twelfth century. It is reputed to have been finished by BUONO, the architect, who died in 1529. From the upper gallery the finest views of Venice and the surrounding land and water were to be obtained. The ascent was by means of a gentle incline, which was lighted at regular intervals by small windows. The faces were not plain surfaces, as there were piers slightly projecting, united above by arches. The pyramid capping the square tower was a much later addition, and was terminated by the figure of an angel. In the recess of one of the windows

the date 1004 is inscribed. The arcades of the upper platform were of red and green marble. It is believed that the campanile can be rebuilt, and money has been already subscribed for that purpose. There are so many views of the structure, and every course of brickwork was so familiar to Venetians, the undertaking would be less difficult than is assumed.

THE Society of Architects are now taking up the question of the Statutory Registration of Architects in earnest. Hitherto they have contented themselves by merely supporting a Bill brought forward by a voluntary committee. Now a strong representative committee have been appointed, with power to add to their number, whose duty it will be to thoroughly overhaul the present suggested Registration Bill, making such recommendations for its improvement as may appear desirable, and subsequently to obtain the opinion of the profession generally upon the subject. If the Society be supported up to this point the necessary steps will be taken to bring the matter fully and fairly before Parliament, and to use for this purpose the official staff and general organisation. A meeting of this newly-formed registration committee was held at the Society's rooms on Tuesday last, when the president, Mr. SILVANUS TREVAIL, F.R.I.B.A., was voted to the chair, and all necessary preliminary steps were taken to set this machinery in motion.

THE Metropolitan Railway of Paris will have to cross the Seine in two places. Near the Pont d'Austerlitz, which has five arches of masonry, a steel bridge of one span will be constructed. At Passy there will be another bridge also of steel, which may shortly be described as a two-decker, and so far as is known will be the first in which that arrangement has been carried out in metal. The viaduct called the Point-du-Jour is familiar to all who have travelled along the Seine; it also consists of two stages, and is looked upon as a rival to the Roman Pont du Gard. The new railway bridge will have a lighter appearance, and as M. FORMIGÉ, the architect, will be responsible for the adornment of it, we may assume it will be a worthy addition to the numerous bridges of Paris.

## ILLUSTRATIONS.

NEW TOWN HALL, HARROGATE.

THE HALL, WALMER LODGE, KENT.

WE present two illustrations showing a view of the principal hall and also a view of the main staircase at Walmer Lodge, Walmer, Kent, which form part of a large scheme of alterations undertaken last year for Mr. ALBERT OCHS, under the directions of Mr. EDWIN O. SACHS. A description of the alterations generally will be given on a future occasion. The design had to be adapted to a considerable extent to existing walls and heights. The doors and woodwork generally are of English oak, and an effort has been made to retain the surfaces as simple as possible, and to limit the carving to a few conspicuous features. The large wall surfaces left in the sides of the staircases had to be schemed in order to take certain panels of old tapestry.

A number of the panels have been fitted to act as side tables, and others to take small showcases for the Roman antiquities which were found in the garden during the excavations in 1900. Other panels, again, have been fitted to take special pictures. The electric switches, &c., also are hidden behind panels. All dado rails are fitted on the E. L. B. system, so that electric contact can be obtained at any point around the walls without difficulty. The installation of the E. L. B. system, as well as of all the special electric fittings in the hall, &c., has been by Messrs. STRODE & CO.

All glass surfaces to windows have cathedral glazing.

The whole of the joinery, as also all of the main alterations of the building, are by Messrs. GEORGE TROLLOPE & SONS, who acted as general contractors throughout under Mr. SACHS'S instructions.

CATHEDRAL SERIES.—HEREFORD: VIEW FROM NORTH-EAST.

## BRAMSHILL AND EVERSLEY.\*

**G**WENT or Y went, as the county through which we have traversed to-day was originally termed, was so named from its open downs, and even in the early Stuart days Bramshill was described as a bare and barren spot.

In 1084 there were four manors at Bromselle; two belonged to Hugh de Port, which were then estimated at the value of 20s, being exactly twice what they were worth in the time of Edward the Confessor. Associated with them were two villeins, two bordmen with a team, the quarter of a mill worth 10d., three acres of meadow, and wood for two hogs.

The other two manors in the Confessor's time were held by Alwi and Elsi, and were worth 40s. At the Conquest they passed to the hands of Gilbert de Breteuil, and were valued at only 25 pence. There was enough land for two teams, and two teams in demesne, four villeins with one team, the usual mill, six acres of meadow, and wood for two hogs. Eventually the manors were amalgamated, but at what date is not known.

Bromselle, Bromeshull, Bromshulle and Bromshyll, as the word was at various times written, derived its name from the broom with which the land abounded. The De Ports continued in possession until 1300, when the property was sold to Sir John Foxly and his wife Constance. Sir John built and endowed a chapel at Bramshill, and Sir William Foxly, who succeeded him, emparked the house. In 1341 Thomas de Woxle, constable of Windsor Castle, was in possession, and

Wales's coronet, and the words Ich Dlen. On the fireplace, too, in the chapel-room, the royal arms appear with the letters I.R. and the date 1624. By a fire it has been stated that thirty-four rooms were destroyed. The house was eventually completed, though not as originally intended, for the wings are of red brick, with quoins, dressings and mullions of Headington stone. The old pipes still remain, bearing the date 1612, with the initials E. Z., and it is gratifying to note that since then the house has never suffered from any modern improvement or restoration. The postern gate with its deep stone recesses is regarded as unique, and the terraces with stone balustrades and alcoves at the corners are remarkably picturesque.

On one terrace the old game of Troco was played. The word is derived from the Spanish, Truco, a table. The game was played on a lawn with wooden balls, and cues with a spoon-shaped loop at the end. The object was to drive the balls through a ring which moved on a pivot when struck; the making of caroms, or cannons, also added to the score. Some of these curious cues and balls are preserved in the house.

In the park, hours might be spent among the splendid avenues of elms, oaks, limes and firs, and in the pleached walks and floral parterres; and these firs are believed to be some 300 years old, and were planted by Lord Zouche at the express wish of James I. They were the first ever brought to England. Charles Kingsley wrote of "James I.'s gnarled giants up in Bramshill Park, the only place in England where a painter can learn what Scotch firs are." The house he

ENTRANCE TO BRAMSHILL.

THE TROCO TERRACE, BRAMSHILL.

later owners were the Rogers and the Essex families. In 1499 Giles, Lord Daubeney, Lord Chamberlain to Henry VII., obtained possession of the land. From the Daubeneys the property passed to the Crown, and in 1547 Edward VI. bestowed it on William, Lord St. John, an ancestor of the Marquis of Winchester. Of Lord St. John we heard at Old Basing; the Bramshill manor house he never occupied. In 1660 the property was sold to Sir Stephen Thornhurst, and six years later it was purchased by Edward Lord Zouche, the eleventh baron, who held Parham Hall, and the ancient manor house, of which some foundations were exposed a few years ago, gave place to the present mansion.

A writer has suggested that Gerard Christmas was associated with the design of Bramshill, but there is little doubt that the building was finished under the direction of John Thorpe, who built Holland House, and the generally accepted tradition is that it was intended for the residence of Prince Henry, son of James I. The original design was entirely of stone, but the early death of Prince Harry in 1612 stopped the work, of which the central portion only had been erected. It is carved and decorated in the Renaissance style; each storey is divided by pilasters into richly decorated compartments, and the whole is surmounted by an elaborate pediment, bearing the Prince of

described "as looking out far and wide over the rich lowland from its eyrie of dark pines."

Lord Zouche, who was also the Lord of Hartley Wintney, remained at Bramshill until his death in 1625; his body rests at Eversley. On Midsummer's Day, 1621, George Abbot, Archbishop of Canterbury, was at Bramshill, and essaying to shoot a deer with his crossbow, by accident he killed Peter Hawkins, the gamekeeper. Kingsley, who claimed descent from the archbishop, has graphically told the story. Abbot had many enemies, and what was termed an official account of the event was published. In consequence he was suspended for four years from all episcopal duty, till a commission was appointed to investigate the matter, when the king passed a pardon and dispensation under the Great Seal. Abbot allowed the widow 20l. a year, and as an act of penance he founded Abbot's Hospital at Guildford for single men and women, and to the end of his days he fasted on a Tuesday in every month.

Bramshill was left by will to Sir Edward Zouche, of Woking, who married Elizabeth, daughter of Henry Middlemore, of Enfield; who was groom of the Privy Chamber to Queen Elizabeth; and here it may be interesting to note that when Elizabeth visited Silchester Heath on September 5, 1601, she said she "was never so honourably received into any shire; as Hampshire is a county pleasant of soile and full of delights for princes of this land who often make their pro-

\* A paper read by Mr. J. Stanley before the members of the Upper Norwood Athenæum.

gresses thither, so it is well inhabited by ancient gentlemen, civilly educated, and who live in great amity together."

From the Zouch family the property passed to the Earl of Antrim, and then to the Henleys. Old Sir Henry Henley was Master of the King's Bench, and his son Andrew settled at Bramshill, and in 1660 obtained a baronetcy. He was succeeded by his two sons—Sir Robert, who left 100*l.* a year to Eversley as an apprenticing fund, and Sir Andrew, with whom lived the famous Alexander Ross, who is recorded on two tablets in Eversley Church.

In 1695 the property was purchased for 21,000*l.* by Sir John Cope, knight, who became the fifth baronet. The Copes in early days owned extensive lands in Northamptonshire. The earliest member of the family of whom record exists was John Cope, who obtained considerable prominence in the reigns of Richard II. and Henry IV. He was twice high sheriff, and in Parliament he represented his native county. His descendant, Anthony Cope, was Vice-Chamberlain to Catharine Parr, and was knighted by Edward VI. His grandson Anthony, who had been knighted by Queen Elizabeth, was created a baronet in 1611. He was high sheriff of the county of Oxford, and married Frances, daughter of Rowland Lytton, of Knebworth. His other grandson Walter was Master of the Court of Awards in the reign of James I., and built Holland House, which in various ways resembles Bramshill. Sir William, the second baronet, represented the county of Oxford in Parliament. Sir Anthony, the fourth baronet, also figured in Parliament. Sir John, who in 1695 became the fifth baronet, represented Oxfordshire and attained high rank in the army; by him Bramshill was purchased. His second son Galen was also an army officer, and afterwards being admitted to holy orders, became rector of Eversley. John, the sixth baronet, had previously been knighted by William III. Under Queen Anne and George II. he was member of Parliament for Hampshire. His son, John, was gentleman usher to the king. Monnoux, the seventh baronet, was member for Banbury. The Rev. Sir Richard Cope, D.D., prebendary of Westminster, in 1770 became the ninth baronet. The twelfth baronet, Sir William, was minor canon of St. Peter, Westminster. Lieut.-Col. Sir Anthony Cope, the thirteenth baronet, who succeeded to the title in 1892, was major in the Rifle Brigade and fought in Ashantee. Among baronets only five take precedence of him, and among Catholic baronets he stands pre-eminent. The motto of the family, "*Æquo adeste animo*"—Be present with mind unchangeable—has ever been applicable to them. In the affairs of the county they have always taken a prominent part, and from their first occupancy of Bramshill they have remained there.

Passing through the cloistered porch, which is elaborately ornamented, we reach the great hall of old, the banqueting-room. The flooring and wainscoting are of polished oak, and the ceiling is enriched with elaborately carved pendants. There is a very large massive screen bearing carved shields, a large Gothic chimneypiece, and a fine bay window commanding a handsome view of the park. Family portraits in old frames adorn the walls, and the furniture throughout has an old-world charm. One interesting picture is *A Meet at Bramshill*; the late Sir John Cope is there, and one portrait is pointed out as the Iron Duke, though Murray states it is John Warde of Squerries, described as the Father of Foxhunters. The Duke of Wellington, however, was a frequent visitor at Bramshill, and once Queen Victoria and the Prince Consort went there with him. The drawing-room has a richly-ornamented ceiling, and the walls are covered with tapestry from designs given by Peter Paul Rubens, and worked under his personal supervision at Brussels. They tell the story of Decius. The chimneypiece reaches to the ceiling, and the fire-dogs are of unusual height. By a wide and handsome staircase lined with pictures the chapel-room is reached, which is very beautifully decorated. Near by is a large library, which admits to the gallery, 120 feet long by 20 feet wide. It has an oriel window in the centre, and contains carved chests and cabinets, musical instruments and other objects of interest; and with one chest the story of the Mistletoe Bough is associated, though I rather fancy it was Samuel Rogers who brought the story over from Italy. Most of the rooms have chimneypieces of black marble; some are 16 feet high and touch the ceiling, and many have polished wainscots, and when one was being repaired about fifty years ago, a letter from Oliver Cromwell was found behind it.

Unwillingly turning our backs on the beauties of Bramshill, we reach the parish church of St. Mary the Virgin, Eversley. It contains a vault belonging to the Copes, and among the memorials is an inlaid sepulchral brass to Richard Pendilton, who died in 1502, in the service of Giles, Lord Daubeney, and a punning Latin epitaph in rhyme to Alexander Ross, written by himself.

In a charter of Edward the Confessor, addressed to Stygand, Archbishop of Canterbury, the church at Eversley is mentioned. The monks of St. Peter's Abbey, Westminster, held the property, and William the Conqueror renewed their

rights. In 1084 we read that they held the four manors of Eversley. In 1535, when Elisha Ambrose was rector, his benefice was valued at 11*l.* 14*s.* 1*d.* Of the lords of the manors and of the various rectors it is unnecessary to speak, but a few notes on Charles Kingsley may be of interest.

We have recently heard the story of the poet Shelley, and reading through the biography of Kingsley, one's thoughts often wander to the poet of Field Place. Kingsley was an infant prodigy, and at the time when many children have scarcely learned to speak, he was writing rhymes and stringing little sermons together, for his father was a clergyman, first at Clovelly and then at St. Luke's, Chelsea. The boy was delicate and sensitive. He was fond of fishing, boating, collecting shells, and indulging in quiet studies with nature for his teacher. At school he was unpopular, and avoiding all rough games, he would wander alone in search of botanical and geological specimens. In 1836 he became a student at King's College, London, and two years later he entered Magdalene College, Cambridge, where he gained a scholarship during the first year. Fanny Grenfell, the lady who afterwards became his wife, he first met in 1839, and in his letters to her he stated how he was distressed by the Oxford movement. In July 1842 he was ordained by the Bishop of Winchester, and was appointed to the curacy of Eversley. He studied the works of Maurice, Carlyle, Arnold and Mill, and was greatly influenced by their writings. His marriage took place in 1844, and the living of Eversley then falling vacant, he was presented to it by Sir John Cope. He repaired the church and rectory, and educated the people who filled the seats that had hitherto been empty. He occasionally wrote under the name of Parson Lot, and contributed papers to the "*Christian Socialist*," which found no favour with the higher classes, for he depicted the agricultural labourer as little better than a serf, and poachers had his fullest sympathy.

WING OF BRAMSHILL.

His "*Yeast*" was described by a critic as immoral; Carlyle, though he praised "*Alton Locke*," said it was "a fervid creation still left half chaotic." In 1851, after he had preached a sermon in a London church, the incumbent rose up and protested against his teaching, and Blomfield, Bishop of London, forbade him to preach in his diocese. In 1864, without the slightest justification, he attacked Cardinal Newman and Catholics generally. The controversy was published by Newman, who certainly refuted his adversary's charges. Yet, though Kingsley as a Socialist and a confessed Darwinian was unpopular with landowners and many of his brother clergy, the Church honoured him. In 1845 he became honorary canon of Middleham, in 1859 he was appointed chaplain in ordinary to the Queen, ten years later he became canon of Chester and in 1873 was made canon of Westminster. Ill-health somewhat crippled his work in later years, and after a long voyage he died at Eversley on January 23, 1875, and was there buried, Dean Stanley taking part in the service, and afterwards preaching a sermon on him in Westminster Abbey, where his bust, by Woolner, is placed. A memorial cross was erected by his widow in Eversley Churchyard, where she now lies by his side. Kingsley had strong opinions, which he had the courage to express; he made mistakes as all men do, but though tares were mixed with the grain he was sowing, England has reaped a plentiful harvest and is the better for his work.

The parish church of Hartley Wintney is dedicated to St. John the Evangelist; the dilapidated building we saw to-day is not of old date, but it was insecurely built, and is now only used as a mortuary chapel, a later church having been erected on another site. Near Hartford Bridge a Cistercian nunnery

was founded in the time of the Conqueror by Roger Colrith, Thomas, his son, and Jeffery, the son of Peter. It was dedicated to the Blessed Virgin Mary, St. Mary Magdalene and St. John the Baptist. The Cistercian was a less austere order than the Benedictines. The order was founded at Citeaux in Burgundy in 1098 by Robert de Molesme and Stephen Harding, an Englishman of Sherborne. Their habit was white, and as a rule their homes were built at least ten miles from a town. Among the benefactors were Nicholas, Bishop of Winchester, Elias, Abbot of Reading, the Prior of Merton and Margaret Zowche, Lady of Farelehe. From the still incomplete list of abbesses which Dugdale, Tanner and Willis have collected I will only quote a few names: Emma, Sabina, Juliana, Hawisa, Roisa, Camaina de Marreys and Petronilla Pigeon. At the time of the Dissolution the house sheltered the abbess and seventeen nuns. By Henry VIII. the "scite" was granted to Richard Hill, serjeant of the king's cellar.

I am afraid my paper is rough and incomplete, but no pen picture I could hope to produce would give any idea of the beauty or interest of the district we have just passed through.

The particulars for my paper were collected from many writers; some I have incidentally mentioned, but I am also indebted to the writings of B. B. Woodward, B.A., F.S.A., the Rev. Theodore C. Wilks, M.A., George Alexander Cooke, Edward Wedlake Brayley, John Britton, Mackenzie Walcott, the Rev. C. Holme, M.A., G. Phelps Bevan, F.S.S., Robert Dodwell, E. R. Kelly, M.A., Sir Bernard Burke, Leslie Stephen, and to an article by the Hon. Mrs. Armytage which appeared in *Madame*.

The illustrations are from photographs by Mr. Henry Virgoe.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE annual general meeting of the Edinburgh Architectural Association was held on the 2nd inst. in the rooms of the Association, 117 George Street, Mr. Henry F. Kerr, president, in the chair. The President reported that the sub-committee appointed to deal with the subject recommended that the Association should affiliate with the Royal Institute of British Architects. There was, he said, nothing to lose and something to gain from such a step. The recommendation was adopted. Mr. William M. Page, one of the honorary secretaries, submitted the annual report, from which it appeared that twenty-two new members had been enrolled during the past session, that two had resigned and that four members had died. The total membership was now 252. Mr. J. A. Arnot, on behalf of Mr. Watson, reported that the library in connection with the Association would be available next session, and that it was proposed that it should be open two evenings in each week, and also for half an hour daily in the middle of the day.

In presenting the report of the Council, the chairman stated, in connection with Mr. Bruce's motion relative to the establishment of a chair of architecture in the University of Edinburgh, that the Council had as yet nothing definite to report. They had, however, consulted sixteen authorities in England and Scotland with the view of obtaining information on the subject. The result of these inquiries would be reported next session. He recalled that the Association had urged upon the Lord Provost very strongly that the buildings the War Office proposed to erect in the Castle next to the hospital, facing Princes Street, would be a great blot on all views of the Castle rock. He thought that their views, humbly expressed, might possibly have done some good, as he had received a letter from the town clerk to the effect that, while that official was unable to say exactly how the matter stood, he had been informed that the War Office did not in the meantime intend to erect any building at the Castle.

The President took as the topic of his address "A College of Architecture and the Technical Arts in Edinburgh." He alluded to the increased attention which was now being devoted to the theory and practice of education in all its branches. To the lovers of architecture and the technical arts the problem was presented, Are your artists and your public educated as they ought to be? In Paris there had been established for many years a great school which trained students in all the arts from architecture to gem engraving. In it an architectural student would require ten years to pass through its curriculum. There was another great school in Paris chiefly for architecture where the period of education was about five years. In Germany several colleges of like nature were to be found, and in America there were at least five universities which had a fully-developed architectural section. In England nothing approaching this existed, and in Scotland the opportunities for improvement were even fewer. In London the Architectural Association provided teaching in every branch of architectural knowledge. In other cities of England training in the technical arts had been established by the municipal authorities. In Glasgow

much good work was being done in an enthusiastic manner at the School of Art. In Edinburgh what did they find? In connection with the Heriot-Watt College some technical classes (excellent so far as they went), drawing and painting under the Board of Manufactures and the Royal Academy, and other isolated and little known studios where the bud of artistic genius was tempted to bloom. Now students of architecture in whom they were specially interested were or ought to be artists; but although artists, something more. An architect must not only be poetic but practical; his work must not only be beautiful but accurate. What was an architect the worse for knowing thoroughly the history and the styles of architecture, even though he might now and again happen to be a genius? Why should he not understand the basis of design and ornament, and exercise himself in draughtsmanship and design? Although to the artistic mind much might be the result of intuition, what harm could ensue from proper drawing out of the latent spirit? Then, on the practical side, what architect was harmed by knowing something of construction, of materials and of architectural practice? Many architects had regretted that their grasp of the capabilities of various materials had not been assisted by practically working in these materials. Would it not be a great help to have young architects try their hand at wood-working, metal-working and stone-working? This led them to the initial demand, that as architecture was not only a theoretical but a practical study, the training must be both theoretical and practical. In medicine and surgery the clinical and theoretical were combined, because they were practical professions. The effect of this training in architecture would be that usefulness, stability, endurance, appropriateness, simplicity, would all be aided by closer practical study and that hand intimacy with materials which had daily to be used. The Edinburgh Architectural Association at an early date recognised this to a certain extent when the work classes were carried on, but workshops were never added. In later years the school of applied art took the place of the work classes, still without workshops, but with great success. Although the applied arts classes were not intended for students of architecture only, but for the whole variety of the applied arts, the architectural students took the fullest advantage, to their great profit. This school of applied art as it stood was the central point of any architectural education, and should also be of the technical arts generally. All the great schools had a similar class, and must have it, and the only point to bear in mind was that design should be as well taught elsewhere as it was in the Edinburgh school. But beyond this a great development of the workshop idea was required, and a thorough curriculum of theoretical study. Every student of architecture should, of course, have a sound preliminary education to form the entrance to the requisite technical studies, and this was the general conception of at least the American schools. After passing through the school the student was placed in a practising architect's office for some three years. Such training, if wisely guided, should provide well-equipped students for the architectural profession. But as students of architecture they could not afford to lose sight of the training in the other technical arts more or less closely related to it. Painting and sculpture if sufficiently provided for in the Royal Scottish Academy need not be touched, but there were many arts in which the theory of design was one, but the methods of working were necessarily diverse. For example, their furniture designing, carpet and tapestry making, decoration, gold, silver, iron, brass, copper and bronzework all strongly co-related to architecture, and all these should be placed on a proper educational footing. And if so, why not include all the technical arts in a great central national college of architecture and the technical arts? It would be a great undertaking, but one worthy of being entertained by the capital of Scotland. Many of the arts they sought to aid owed much to past Scottish handicraft, and they might fairly endeavour to conserve the technical methods and natural character of the arts, correcting by comparative analysis the errors of decaying tradition and any unfortunate mannerisms. Now, it might be asked, How was this great college to be founded and how maintained? Many of the English municipalities supported technical and art education, and probably it might be right to expect some municipal help in this matter from the city of Edinburgh. But for this great national scheme some wealthy sons or daughters of Scotland must have their hearts touched by the claims of national art, and give of their means to preserve what remained, and to put on a proper basis the future of Scottish design. If any stimulation was required, the munificence of the Americans towards schemes of this nature in connection with their universities should call for emulation. That such a practical school for the arts was a matter of supreme moment was generally admitted, and so great was the outlook that no one could foretell the vast beneficial results that might come in the near future to redound to the credit of our land. Scottish artists in many departments had done wonderfully despite the lack of systematic and sympathetic teaching, and they could confidently look forward to further

and greater honours if students had the advantages of an ample foundation and a wise course of study in a national college of architecture and the technical arts in connection with the University.

The following office-bearers were elected:—President, A. Hunter Crawford; past-president, Henry F. Kerr; vice-presidents, H. O. Tarbolton and J. S. Syme; hon. secretaries, William M. Page and Colin B. Cowrie; hon. treasurer, W. Glassford Walker, C.A.; librarian, John Watson. Conveners of committees—Library committee, John Watson; publication committee, G. S. Aitken; sketchbook committee, John Watson. Committee of management, Thomas Ross, Professor Baldwin Brown, Daniel Macfie; from associates' section, Alfred Greig, A. Lorne Campbell, J. D. Trail. Auditors, W. J. A. Drummond, C.A., James Walker, C.A.

On the 5th inst. the annual excursion of the Association to Carlisle, Naworth and Lanercost took place. The party travelled to Carlisle on the previous evening, and utilised the short time after their arrival by walking about and viewing the Royal Agricultural show ground. On Saturday morning the town hall was first visited, by permission of the mayor and aldermen. The party was received by Mr. Graham, city treasurer, and the interesting old building was described by the Rev. Canon Bower. St. Cuthbert's Church, where are interred some of Lord Rosebery's ancestors, was next visited, and also the police chambers. Here the city mace, sword and fine old silver vessels awakened great interest. The party then proceeded to the castle, where an interesting time was spent. The entire castle buildings were thrown open for the inspection of the members, by command of Colonel Brind, and the party was conducted over them by the official guide. The magnificent views obtained from the top of the old Norman keep were much enjoyed. The cathedral was next inspected by permission of the Very Rev. Dean Henderson. The members were received by the Rev. Canon Bower and Mr. C. J. Ferguson, architect, acted as leader, and gave a descriptive account of the buildings. The conventual buildings and deanery were also visited. After lunch train was taken to Naworth, and the members drove to Naworth Castle. Lord Carlisle granted permission for the visit. The old tower and later additions, with their fine hall and quaint chambers, were of never failing interest, while the gardens and the beautiful surroundings made the visit memorable. Mr. Frederick Franklin, architect, acted as leader. The party then walked through the glen to Lanercost Priory, where they were received by the Rev. T. W. Millis. The rev. gentleman conducted the members over the church and conventual buildings and described their various features. The drive was afterwards continued to Brampton, where tea was partaken of, and the party returned to Carlisle in time for the 8.20 P.M. West Coast express train back to Edinburgh, dinner being served on board the train. Perfect summer weather favoured the outing, which was greatly enjoyed. The president, Mr. Henry F. Kerr, A.R.I.B.A., the vice-president, Mr. A. Hunter Crawford, and the honorary secretary, Mr. William M. Page, were present, the last-named having made all the arrangements for the excursion, assisted by Mr. H. Foxall, of Carlisle.

### GEORGE WASHINGTON, SURVEYOR AND CIVIL ENGINEER.\*

IT is well known in a general way that George Washington commenced his career as a surveyor, but there are no connected records of his work in that line, and the meagre information one can find in the accounts of his life does not give an adequate conception of his proficiency and activity as a surveyor or of his unusual ability and the vast amount of important work which he conceived as a civil engineer.

Washington is reported to have evinced marked aptitude for mathematics at the early age of eleven. He took a course in surveying and navigation at Mr. Williams's school, in Westmoreland County, Virginia, and become so interested in these branches that later he served a special apprenticeship in practical work under Mr. James Genn, a licensed surveyor. In the Clerk's Office of Culpeper Court House is recorded the following:—

"July 20, 1749 (O. S.), George Washington, Gent., produced a commission from the president and master of William and Mary's College, appointing him to be surveyor of this county, which was read, and thereupon he took the usual oaths."

His proficiency in this line led to his employment by Lord Fairfax in 1748, when but a boy of sixteen, to survey certain portions of his lordship's estate in the Blue Ridge Mountains. During the next four years he devoted his time to making the

surveys incident to land sales, having the general direction also of his lordship's land office.

The first record of a survey made by George Washington is as follows:—

"March y. 15th 1747-48. Survey'd for George Fairfax, Esqr. a tract of land lying on Cates Marsh and Long Marsh beginning at three Red Oaks Fx on a Ridge the N° Side a Spring Branch being corner to y<sup>e</sup> 623 Acre Tract & Extending thence N° 30° E' 436 poles to a Large Hickory and Red Oak Fx near John Cozines house thence N° 60° W' 90 poles to a Large White Oak Fx thence N° 7° E' 365 poles to Long Marsh," &c.

Another record of his early work is as follows:—

"SURVEY'D for Richard Barnes, Gent of Richmond County a certain Tract of Waste and ungranted Land Situate Lying and being in the county of Culpeper and Bounded as followeth Beginning at three white Oaks in Normans Line and Corner Trees to (Aaron Pinson's now) Mr. Barnes's Land & extending thence N° 42° 30' W' Ninety five Poles to a branch of Flat Run Two hund and Eighteen Poles to a Large White Oak Corner to Norman etc. \* \* \* thence with his Line N° 53° E' One hund<sup>d</sup> and Eighty Six Poles to the Beginning Containing Four Hundred Acres this Twenty Second Day of July 1749.

by

Washington S C C.\*

The following is a copy from one of his more recent notebooks, and shows the improvement in his later work:—

"From the centre of the road leading to the Mill at the White gate (the course of that road being N. 74 W.) the following courses and distances were run and measured:—

"N° 74 E. 42 poles to a blazed red oak on the left of the road; thence along the new marked line.  
"N 21½ E. at 104 poles came to the first hollow;  
at 126 do. came to the second hollow;  
at 146 do. came to the cross line leading to Muddy Hole gate; and at 174 poles came to the old road leading to the Gum Spring;  
thence along that, &c."

It is a matter of record that, while Major L'Enfant is to be credited with working out the details embodied in the plans of Washington city, it was President Washington who, as consulting engineer, directed the work of L'Enfant. Washington and L'Enfant made several trips over the site of the city, and the former personally selected the location of the Capitol, of the White House and of other prominent buildings. Moreover, to him L'Enfant submitted at least two plans of the city, in which Washington made corrections. It is clear, therefore, that to the latter is due the honour of being the chief or consulting engineer of the new capital.

Washington was also a military engineer of no mean ability. In 1752 the engineer of the Ohio Company, Mr. Christopher Gist, recommended the erection of a fort at McKee's Rocks, a few miles below Pittsburg, on the east side of the Ohio. Concerning this Washington says in his diary:—

"I think it greatly inferior either for defence or advantage, especially the latter, for a fort at the forks would be equally well situated on the Ohio and have the entire command of the Monongahela."

In 1754 Washington was commissioned colonel of a Virginia regiment, with orders to cross the Allegheny Mountains and protect the men of the Ohio Company who were trading in that section and to build forts. On the outward march, and as the company was nearing the French forces, a temporary fort, known as Fort Necessity, was thrown up on a tributary of the Youghiogheny river. On his return Washington sent drafts of plans of two forts to the Governor of Virginia.

It was upon his return, in 1754, from his trip across the mountains that Washington began to ponder the great engineering problems to which he devoted the greater part of the latter years of his life. He had conceived those gigantic works for internal communication between the coast and the western country which have since been elaborated into some of the most extensive schemes of transportation by water, highway and railway that the world has ever seen, and from this time forth he investigated them in the true spirit of the civil engineer. Immediately upon his return from the trip above referred to, he reported to the Governor of Virginia in favour of a scheme of communication between the Atlantic States and the great West. The next year, while aide to General Braddock, in his disastrous campaign against the French and Indians, he retraversed much of the same route, and upon his return prepared a map, still in existence, which

\* A paper read at Mount Vernon by Herbert M. Wilson, before the convention of the American Society of Civil Engineers, and published in the *Engineering Record*.

\* For this survey Washington received the sum of 2*l.* 3*s.* on July 25, 1749, as shown by entry in his cash book, a copy of which is in the Toner Collection, Library of Congress, Washington, D.C.

shows the relations between the head-waters of the Potomac, the Monongahela, the Youghiogheny and neighbouring streams, and the portages which should be opened up to admit of water and portage transportation between the Atlantic coast and the headwaters of the Mississippi.

Washington was undoubtedly the originator and promoter of the Potomac Company, from which sprang later the Chesapeake and Ohio Canal.

It was through his efforts that the Virginia Legislature passed a Bill empowering such individuals as were so disposed to embark in the enterprise to open the Potomac, so as to render it navigable from tide-water to Wills Creek (Fort Cumberland).

Washington was not only the first to map and recommend the general route of the great highways called the National Pike and the Chesapeake and Ohio Canal, which later in truth became, to quote him, "the channels of conveyance of the extensive and valuable trade of a rising empire," but he was also the first to commend and predict the commercial success of that route through the Mohawk valley which was afterwards taken by the Erie Canal and the New York Central Railroad.

The National Pike, the route of which was practically located by him and the construction of which he planned, from the Great Falls of the Potomac to Pittsburg was, and still is, as many of you may not know, one of the best aligned, best graded and best macadamised roads in America.

"I have lately," said Washington, in a letter to the Marquis of Chastellux, "made a tour through the Lakes George and Champlain, as far as Crown Point; then returning to Schenectady I proceeded upon the Mohawk River to Fort Schuyler, crossed over to Wood Creek, which empties into the Oneida Lake, and affords the water communication with Ontario. I then traversed the country to the head of the eastern banks of the Susquehanna, and viewed the Lake Otsego, and the portage between that lake and the Mohawk River at Canajoharie. Prompted by these actual observations, I could not help taking a more contemplative and extensive view of the vast inland navigation of these United States, and could not but be struck with the immense diffusion and importance of it, and with the goodness of that Providence who has dealt His favours to us with so profuse a hand. Would to God we may have wisdom to improve them. I shall not rest contented until I have explored the western country, and traversed those lines, or a great part of them, which have given bounds to a new empire."

There is little definite record of actual construction of engineering work by Washington. There is no doubt, however, that he laid out the route and partly built a portion of the Chesapeake and Ohio Canal on the Virginia side, from the Great Falls towards Alexandria. Later the location of this canal was changed to the Maryland side, but the portion above referred to was excavated under his supervision and some locks were built upon it under his direction.

In the beginning of the autumn of 1784 General Washington made a tour as far west as Pittsburg. On returning, his first moments of leisure were devoted to the task of engaging his countrymen in a work which, though of great commercial importance, appeared to him to merit attention chiefly by reason of its political influence on the Union. In a long and interesting letter to Mr. Harrison, then Governor of Virginia, he detailed the advantages which might be derived from opening the great rivers, the Potomac and the James, as high as should be practicable. He suggested the "appointment of commissioners of integrity and abilities, exempt from the suspicion of prejudice, whose duty it should be, after an accurate examination of the James and the Potomac, to search out the nearest and best portages between those waters and the streams capable of improvement which run into the Ohio." Those streams were to be accurately surveyed, the impediments to their navigation ascertained, and their relative advantages examined. The navigable waters west of the Ohio, towards the great lakes, were also to be traced to their sources, and those which empty into the lakes to be followed to their mouths.

"I need not remark to you, sir," said Washington in his letter to the Governor of Virginia, "that the flanks and rear of the United States are possessed by other powers—and formidable ones too; nor need I press the necessity of applying the cement of interest to bind all parts of the Union together by indissoluble bonds—especially of binding that part of it which lies immediately west of us to the Middle States. For what ties, let me ask, should we have upon those people, how entirely unconnected with them shall we be? . . . Until the Spaniards (very unwisely I think) threw difficulties in their way, they looked down the Mississippi—and they looked that way for no other reason than because they could glide gently down the stream, without considering, perhaps, the fatigues of the voyage back again, and the time necessary for its performance, and because they have no other means of coming to us but by a long land transportation through unimproved roads."

To a member of the National Legislature he observed con-

cerning the same subject:—"Extend the inland navigation of the eastern waters—connect them as near as possible with those which run westward; open these to the Ohio; open also such as extend from the Ohio towards Lake Erie—and we shall not only draw the produce of the western settlers, but the peltry and fur trade of the lakes also, to our ports, thus adding an immense increase to our exports, and binding those people to us by a chain which can never be broken."

One hundred and fifteen years ago Washington asked:—"Would it not be worthy of the wisdom and attention of Congress to have the western waters well explored, the navigation of them fully ascertained and accurately laid down, and a complete and perfect map made of the country?"

Here at Arlington you may find a memorandum by Washington of the measurement of the altitude of the porch pavement above mean low tide of the Potomac River, showing the same to be 124 feet 10½ inches. Washington's compass is here, as is also the tripod which he used to support his instrument. About you are evidences of his skill as a landscape gardener.

It is thus evident that George Washington possessed unusual ability for his day as a surveyor. His maps and the records of his surveys are among the best of that time. So remarkably acute and comprehensive was his vision, it is not strange that in this pursuit he could not rest content with mere land surveying, but must pass on to exploratory surveying and to consideration of the relations existing between the drainage basins of an extent of territory greater than had probably ever before been compassed by the mind of surveyor or engineer. The brilliancy of his conceptions, the vigour with which he pressed his plans before State and national legislatures, and the fact that his plans have since been carried out in whole or in part, entitle him to rank as the first and one of the ablest of the civil engineers of America.

## THE SOCIETY OF ARTS.

THE report for the year in referring to the applied art section says six meetings were held during the session in this section. The first, on January 21, was devoted to the consideration of "The Architect's Use of Enamelled Tiles." Mr. Halsey Ricardo discussed the use of tiles both for the outside and inside of buildings, and illustrated his subject by a large number of lantern slides of buildings in Europe and in the East. He strongly urged the use of colour decoration in our streets, and classed the purposes for which tiles are used in architecture under three headings—for hygienic purposes, for saving or reflecting light, and for decoration.

The second paper, on February 4, on "The History of the Rosary in all Countries," was read by the Rev. Herbert Thurston, S.J., at a meeting over which the Cardinal-Archbishop of Westminster presided. Father Thurston traced the use of the rosary in the East to the Hindoos long before the introduction of the Buddhist religion. Paternosterers or sellers of rosaries in Paris and London are mentioned in documents of the thirteenth century, and they probably existed long before that period. All the varieties of form in rosaries are to be found in the old sepulchral brasses, and the author showed how strong an influence the general use of the rosary in the Middle Ages had upon the art of the times.

Mr. Gerald C. Horsley read a paper on March 4 on "Structural Colour Decoration of the Interior of Public Buildings," in which he alluded to the growth of colour schemes intended to accentuate the architectural lines of large buildings. The author reviewed the various attempts at colour decoration in churches and other public buildings, and pointed out that there had been a decline in the decoration of our buildings in colour since the sixteenth century. He showed that there were two distinct modes of decoration—(1) in which colour was obtained from structural materials, as shown in floors, walls and roofs, and (2) decoration in colour after the completion of the building.

At the fourth meeting, on April 8, Professor Beresford Pite read a paper on "Street Architecture," in which he pointed out the difficulties attending the adaptation of rigid architectural rules to iron structures now so common in our streets. Uniformity and symmetry were still attainable, but he feared that picturesque streets were things of the past. The modern difficulty in the treatment of street architecture was the shop window, and the chairman (Mr. Thomas G. Jackson, R.A.) agreed with Professor Pite that our commercial architecture must be frankly modern.

"The Printing and Illustration of the Modern Book" was the subject of Mr. Charles T. Jacobi's paper on May 6. The author referred to what had been done in the past towards the production of a perfect book, and from what was to be learnt from this inquiry he deduced certain principles by adherence to which we might still hope to produce beautiful books. The work of the early printers was to be studied and followed with

such adaptations as were necessary for modern requirements; thus, the best title-pages of modern times were largely adapted from early Italian examples. The three elements in the production of an artistic book were type, paper and ink. The illustrations should be in harmony with the type, but one of the artistic printer's greatest difficulties was that the paper best fitted for the type was often least fitted for adequate reproduction of half-tone prints.

The last paper of the session was read on May 27, by Miss May Morris, on "Pageantry and the Masque." In this scholarly paper Miss Morris gave a vivid picture of the pageants in the streets of London and other towns in the Middle Ages, and showed how artistically these shows were conceived and carried out, in striking contrast to the want of æsthetic fitness so manifest in much of the decoration of the present day.

### INDIAN FESTIVALS.

AN abstract of a paper on "Pageantry and the Masque," by Miss May Morris, appears in a late number of the *Journal of the Society of Arts*. It was prepared to fill the place of another paper which was to be read before the Applied Art Section of the Society. Sir George Birdwood, K.C.I.E., C.S.I., presided on the occasion, and in his speech referred to the cause, or causes, of the decay during the past 200 years of the pageantry of the streets and highways, and of our public life generally in this country. This was one of those great matters, too high for him, in which, nevertheless, he was always exercising himself; and the only conclusion on it he could advance was that the decay was attributable to the gradual failure of faith throughout Protestant countries in the sacramentality of universal nature; faith in which would seem to be the originating, continuing, and ever elevating force of the whole art of life—including its every artistic and picturesque presentation—as at once the symbol and assay of a life beyond life. At least among the historical nations who still followed in the faith of their fathers, the pageantry of popular life remained as spontaneous, real, and convincing as it was in once Catholic England. In India the people, and emphatically the Hindus, continued to live and move and have their daily being, as from antiquity, in the frankest, freest, and most familiar, and the most joyous communion with their gods; the greater gods of earth and sea and sky, and the lesser gods—imaged by roughly hewn stocks and stones—of their streets and roadsides, and the Lares and Penates of the recesses of their homes—figured by strange forms of rudely cut and beaten brass and copper: and certainly the pageantry of their common life—in which nothing was common or unclean because all was divine—shapes and colours, and fills the complete diurnal and annual round of the dædal globe whereon they tread. Every morning at sunrise the women are to be seen in their long flowing robes of white, or pink, scarlet, black, blue, yellow, or green, perambulating in archaic Aryan worship the four horned altar on which the pot of "Holy Basil" is placed in front of every Hindu house, invoking the blessing of the Almighty on the House Father and Mother, and their Sacred Family. The fields, and villages, and towns, are periodically perambulated in the same way; and thus the whole world of India is, at times, to be seen out in the dewy sunshine of the dawn walking with God.\* Again every evening as the fiery orb of the sun sets silently below the unclouded horizon it is solemnly saluted; when, in the sudden night which follows, the temples are all brilliantly lighted up and visited in turn by the thronging crowd.† Then there are the great festivals of the gods for every month, and almost every week, of the year. The festival of the Winter Solstice is held in Bombay [early in January], in honour of the ancient Vedic gods, Indra [the Rain], Varuna [the Waters], Agni [Fire: cp. "ignis"], and Surya [the Sun]. The moment the sun enters the sign of Aquarius, all the people go down into the sea, and rub their bodies over with sesamum

seed, the favourite seed of the sun, for the pure, bright light it oil gives; whence the phrase, "Open Sesame." The rest of the day is spent in out of door and indoor rejoicings; and wherever friends meet they offer each other comfits of sesamum seed, saying, "Take, eat these comfits of sesamum seed, and think kindly of me throughout the coming year." At the celebration of the Hindu New Year's Day [March 21], the standard of Indra is set up in front of every [Hindu] house in Bombay. It must be set up before every house, for, on this day, it is raised in honour of Indra on the inestimable height of higher heaven; and the will of the gods is to be done on earth even as in heaven. So on this day the standard of Indra waves in every wind under the firmament, over all India; and at night in Southern India, his bonfires blaze on every hill. But the Holi festival [early in March], held in honour of Krishna, is the great saturnalia of the spring equinox in India, and the greatest popular pageant of Western India. In the surging tide of the processions which traverse every street of Bombay the whole life of Krishna is enacted, and particularly his sports with the shepherdesses [*gopis*], the mingled crowd of devotees as they tumultuously advance singing hymeneal songs and throwing red powder [*gulal*], and flowers, and sweetmeats, and squirting coloured and scented water at each other, and the images of the god borne aloft among them. At the close of the festival bonfires are lighted, into which the Holi cake is thrown as a burnt-offering. Much fun also goes on in making people "April—or rather March—fools." The Summer Solstice is celebrated all over India [end of June], but in Bombay the rejoicings are of rather a domestic than public character, on account of the heavy rains at the setting in of the south-west monsoon. The annual procession [about the middle of September] of Ganapati or Gan-esa [literally "Lord of the Hosts (gangs of heaven) the god of Wisdom"], presents in Bombay and Poona a scene of unbounded mirthfulness. Every house contributes an image of the god to the procession, in which every member of every family joins. The images of the god are each carried in a palanquin, profusely hung with the choicest flowers of the season, the god himself also being crowned with roses. With loud shoutings and laughter the gigantic procession makes for the sea, or for some tank, where the images are thrown into the water, in which the god is supposed to pass the night; and that night no one may look the moon in the face. The Dasara [last week of October] is the great Indian festival of the autumnal equinox. In Bengal it is held in honour of the dread goddess Kali or Durga, the wife of Siva, the God of Destruction; and the great nocturnal procession of the goddess, with its interminable blaze of torches and coloured [Bengal] lights, blue, red, and green, and incessant detonation and deflagration of fireworks, and its wildly whirling crowd of leaping and yelling men, holding up over the heads the mystic vase containing the conjoined symbols—crossed triangles, and lotus "Knop and flower"—of Kali and Siva, and of dancing and singing women—waltzing round and round and in and out the uproarious onrushing turmoil, and singing as they waltz in robes of the brightest motley—the procession from end to end lit up luridly against the blackness of darkness of the night, in which the high tottering images of the goddess are partially lost; all this presents a seething spectacle of frenzied religious enthusiasm, indescribable in its impression of weird and phantasmal picturesqueness. In Bombay, the solemnity is characteristically kept as a great military pageant, in honour of the tremendous war, sung of in the "Mahabharata," between the heroic Pandavas and their cousins the equally heroic Kauravas. From every rural village to the town the higher and lower hereditary officials, and the whole body of the cultivators, issue forth in great gala, and perambulate the bounds of the township, or village, and worship the trees, defining them, particularly trees of such rich and showy effluence as the *Butea frondosa* [*palas*, whence Plassey], *Cassia fistula* [*bawa*], *Prosopis spicigera* [*shami*], and *Bauhinia racemosa* [*apti*]. In the "native states," the Hindu princes and chiefs ride forth on their painted horses,\* in the full gorgeous panoply of Mediaeval war—like to

The great Emetrius, the King of Inde—

with flags flying, and blare of trumpets, crash of shawms, and piercing notes of high shrilling pipes, and the measured bang of a well belaboured big drum; and, with their whole court arrayed in the richest apparel of state—robes, turbans, and fluttering scarfs of yellow, edged green, and every tinct of red edged yellow, and white edged red, and black, white and blue, dull orange [*bhagwa*], the caparisons of the same colours as these edgings, and overlaid with gold plates and studs, richly embossed, and resplendent with talismanic gems; and garlanded with flowers, as are also the musical instruments and the tall spears, and the flags. And so the gay cavalcade rides on and on into the green wild, to some full blooming

\* This perambulation [*pra-dakshina*, "advancing—with face to the sun—right-hand-wise"—compare Deisul] in the direction of the sun's course from east by south, and west, and north, round to east again, the most ancient rite of Aryan sun worship, survives to this day in the service of the sacring of our English sovereigns. In anointing the sovereign, the Cruciate or Western order of enumerating the four quarters of the heavens is observed, *i.e.*, the forehead and breast, and then the left and right arm, are in succession touched with the anointing balm; but in the previous presentation of the sovereign to the people, the archbishop, in reciting the terms of "Recognition," observes the Circular or Eastern order of the four quarters of the heavens, addressing the assembled company successively toward the east, south, west, and north. It is to be observed also that the "Colobium Sindonis" with which the sovereign is after unction invested, originally meant a "tunic of Indian [Sindian] stuff," *i.e.* cotton—not linen, as now.

† These simple rites recall the "Hymnus ad Gallicantum" and the "Hymnus ad Incensum Lucernæ" of the primitive Christian families. [Prudentius.]

\* They are stained on their manes, and tails, and legs below the knee—the milk-white horses red, the black white or yellow, the green, and so on.

Butea,\* or Cassia, or Prosopis, or Bauhinia, that has before-hand been marked out as its cynosure and goal; and perambulating it 7 times or 9, or 12, 19, 21, 84, or 108 times, gathers its golden flowers in armsfull, calling them "gold" [*sona*], and offering, them on the return journey, as "gold" to the idols of the wayside village temples. Going and returning, wherever these gallant companies ride, the good Lord Sivaji, in their vision, rides on before—just as St. George once rode before our English chivalry—Sivaji, the partisan leader of the Mahratta race against the suzerain Mogul, and the idolised personification of their impassioned patriotism and romantic valour. Such is the Dasera of Western India, and in all the instinctive, spontaneous ritualism of Hindu life this solennial pageant of the Mahratta Princes is

—the master dream, of a life of dream  
And the faith of a flower's beauty.

The Divali, or great Feast of "Lanterns" [about second week in November] held in Bengal in honour of Kali in her more beneficent aspect, is in Bombay again characteristically celebrated in honour of the joyous Lakshmi, the Goddess of Good Luck, or Good Fortune, the wife of the Lord Preserver Vishnu. Every house in the town and island is traced out with "rows of lamps" of cocoa-nut oil, which gives a soft, pure flame of the most perfect and far-reaching illumination, irradiating the whole town of Bombay, and the whole length of the Island of Bombay from Mahim to Colaba, in an illimitable light of the most ethereal splendour, reflected far out into the Erythrean Sea. The eyes that once gaze on its glory remain under its enchantment for ever. The great Mahometan religious solemnity of the "most holy" Muharam, held in perpetual memorial of the massacre of the sons of Ali, Sir George Birdwood said he had described in detail in Sir Lewis Pelly's "Introduction to the translation of The Miracle Play of Hassan and Hussain" [Allen & Co.], and he would refer those present who wished to follow the matter further to Sir Lewis Pelly's obscure but profoundly suggestive volumes. He had said enough to show that the popular life of India was in this way everywhere filled with divinity; and that was the only explanation he could suggest of its universal artistic attractiveness, and of the complete content of the people in it—which neither wars, nor plague, nor famines could perturb or confuse. He had found it very much the same in Catholic Europe. He spent the year of the Great War of Giants in France, and was living in Boulogne at the time of the death and burial of Monseigneur Hafrangue, when the apple orchards around about were in their full bloom. Many present would know Boulogne, the new town flush with "the streak of silver sea," and the old town above, still high cinctured by its Mediæval wall, and the old apple trees planted on the ramparts, with the cathedral church of Our Lady of Boulogne brooding over all. About three hours before the interment half a mile or more of sable cloth, from 4 to 5 yards broad, and diapered over with large ivory-white *fleurs de lys*, was rolled out from the cathedral stores, and hung above the shop and other ground-floor windows, along the length of every street to be traversed by the funeral procession. This was all on foot—the ordinary clergy in black and white, a small knot of church dignitaries in robes, and nodding hat tufts, of various colours, and a few civil and military functionaries in official uniforms. Nothing could have been more unprepared, yet nothing more real and impressive in its simple, and—alike in picture and in sentiment—most expressive pomp. With that cloud of apple blossoms, in all their lavish loveliness, enwreathing the whole scene, it was as if an illumination out of some old Froissart had been suddenly reproduced in the landscape and life and religious feeling of 600 years ago. Here, in answer to a question from the audience, Sir George Birdwood said they might make sure of the spectacular success of the Coronation Durbar at Delhi. The present Viceroy was a statesman of artistic sensibility, and quick, instinctive sympathy with everything in the vernacular culture of the people of India that had contributed to develop their unique historical personality, and being also a man of powerful intellect, with the disposition to do

things magnificently, and wielding autocratic power, he might be relied on to make the approaching Durbar altogether worthy of them and of the traditions they cherished of the glories of the reigns of Vikramaditya and Salivahana. Continuing his remarks, the Chairman said that one of the circumstances of his life he always recalled with pride was his having occupied that chair when, in 1892, the illustrious father of Miss May Morris read his paper before the Applied Art Section on "The Woodcuts of Gothic Books." The Great Exhibition of 1851 inflicted two cruel blows on our prosperity and reputation; it betrayed our manufacturing processes and our commercial organisations—in a phrase, our "trade secrets"—to the whole world of ravaging competitors, whose envy, hatred, and malice has ever since dogged our footsteps in all our international relations; and it also cosmopolitanised and so degraded and deformed our national industrial arts. The great work of William Morris was to lead back our arts and crafts to their traditional methods, and "motifs," and style; and he happily lived to influence by his direct teaching and example almost every department of our decorative arts—painted tiles, stained glass, furniture of all uses, woven and dyed and printed stuffs, embroidery, domestic metalwork, and book printing, book illustration, and bookbinding, and now at last our jewellery is beginning to feel something of his indirect influence—once again proving that death has no power over those whose work is deathless. It was, indeed, by the death of William Morris that the true purpose and dimensions of his lifework were first made manifest to us, and he is now recognised throughout the civilised world as the greatest art master of the Victorian Age, who stamped his glorious personality on every English craft and household art of the nineteenth century.

#### HAWICK ARCHÆOLOGICAL SOCIETY.

THE annual field day of this Society was held on the 12th inst., when about forty of the members and others had an excursion to Lauder and other places of historic interest in the neighbourhood. Proceeding by train to Melrose, they drove to Lauder *via* Glendearg Castle, which is associated with "The Monastery," one of Sir Walter Scott's novels. There are three forts in close proximity, and these were occupied by the defenders of the monks of Melrose in olden times. The old parish church of Lauder, which is a pre-Reformation one and cruciform in shape, was visited, also Thirlstone Castle, the seat of the Earl of Lauderdale. This castle is of great size and strength, part of it having been built by Edward I. early in the fourteenth century, and some of the rooms contain family portraits and other very valuable pictures by Lely, Hogarth, Romney, Sir Joshua Reynolds and other old masters. Thirlstone Castle, being near the Border, was in ancient times very often in the hands of the English. In one of the rooms Prince Charlie slept after the battle of Prestonpans. Unfortunately the weather on Saturday afternoon was showery, and the party had to forego a portion of their programme.

#### BIRMINGHAM ARCHÆOLOGICAL SOCIETY.

ON Saturday a party of members and friends of this Society visited three of the most interesting churches in Warwickshire—Knowle, Temple Balsall and Berkswell. The fine church at Knowle is, outwardly at least, familiar to most Birmingham people, though a much smaller number would be acquainted with its interior. This may be described as a study in church extension. Originally designed as an ordinary parish church, the foundation of a chantry caused the addition of a side chapel, which has now become a transept. The church was afterwards made collegiate, with the result that the chancel had to be much lengthened. The original elevation of the chancel must have been much greater than now, since the sedilia and piscina, which remain, are at an impossible height above the present pavement. Perhaps the greatest ornament of the church is the beautiful rood-screen, though this, like the church itself, has suffered materially from restoration. The visitors next drove to Temple Balsall. This very beautiful thirteenth-century church derives its name from the Knights Templars, who built it, but did not long retain possession. It is remarkable for its simplicity as well as for its architectural charm, consisting as it does of one single finely-proportioned space, without any division whatever. Being built on rapidly-rising ground, the body of the church ascends to the chancel by a series of progressive elevations. The Geometrical windows are among the best of their kind known, and the whole edifice is surmounted on the outside by a very singular frieze of human and grotesque heads, full of character and most original in design. Beside the church stands what was once the grange, with perhaps the refectory of the order. Outwardly this is so changed that no one would date it earlier than the eighteenth century, but within it retains some fine evidences of its actual antiquity.

\* All these trees flower in the spring, but one or other of them, if it be only a solitary example, is always to be found conspicuously in flower also in the autumn. While revising the proof of these remarks I note in the *Pall Mall Gazette* of this afternoon [June 17] that the townfolk of the Royal Burgh of Linlithgow are this very day summoned to the ceremony of marking the bounds of the town in the following traditional terms:—"Oyez! Oyez! Oyez! The burgesses, craftsmen, and whole inhabitants of the Royal Burgh of Linlithgow are hereby warned and summoned to attend my Lord Provost, Bailies, and Council at the ringing of the bells on Tuesday, June 17 curt., for the purpose of riding the town's marches and liberties according to the use and custom of this ancient and honourable burgh royal, and that in their best carriage and equipage, apparel, and array, and also to attend all diets of Court held and appointed upon that day by my Lord Provost and Bailies, and that under the penalty of 100*l.* Scots each. God save the King and my Lord Provost." The italics are mine.—Geo. B.

The almshouses, which also adjoin the church, were erected and endowed by Lady Catherine Leveson, and present an ideal picture of a peaceful retreat for age and infirmity. A drive by country by-roads brought the party to Berkswell, where, after tea, the fine church was carefully inspected. This is of various ages from the twelfth to the seventeenth century, and has the advantage of having been restored with care and reverence. The Norman windows in the east end, and the curious and grotesque corbel heads on the south side, are striking features. There is also a Norman crypt, once probably a place of pilgrimage, and reached by a stair, which seems to intimate the expectation that those who visited the holy place would have prepared themselves by fasting. This crypt was for some time a place of burial, and still contains some half-dozen coffins, with their occupants, a somewhat grim spectacle to the pilgrims of the present day, whose objects are mainly of an architectural nature. Happily the crypt is excellently ventilated. Some of the old galleries remain, and the vestry over the half-timbered porch is delightfully quaint. In visiting all three churches the party had the able guidance of Mr. J. A. Cossins, by whom every detail of their construction was furnished.

### THE CARDMAKERS' COMPANY.

THE prizes offered by the Cardmakers' Company for the best designs for a pack of cards have been awarded as follows:—First prize, 10 guineas, Mr. H. W. Hardy, 17 Featherstone Buildings, Holborn; second prize, 5 guineas, Mr. MacCoteron, 36 Great James Street, Bedford Row; third prize, 3 guineas, Miss Margaret Roscoe, Box Hedge, Great Budworth, Northwich, Cheshire; fourth prize, 2 guineas, Mr. Fred W. Walenn, The Studio, 15<sup>1</sup>/<sub>2</sub> Avenue Road, St. John's Wood; commended, Mr. Cosmo Crump, 324 Upper Street, Islington; Mr. Fred Leighton, 122 Upper Tulse Hill; Mr. W. H. Riley, Waverley, Dashwood Street, Leicester; Mr. F. Colin Tilney, Unaleigh, Green Lanes, Winchmore Hill; and Mr. W. McBride, 17 Pembroke Road, Dublin. There were 230 entries. Mr. Hardy's card shows the figure of Peace with the olive branch, while the clouds in the background are rolling away. On one side of the figure is the coat of arms of the City of London, and on the other the arms of the Cardmakers' Company appear. This card will be reproduced and presented at the Master's and Wardens' inauguration dinner.

### GENERAL.

**The Enlargement** of Victoria station by the London, Brighton and South Coast Railway is to be commenced forthwith.

**Professor Halsey C. Ives**, the chief of the department of art at the Universal Exposition, St. Louis, 1904, has arrived in London.

**A Memorial** is to be erected in Peterborough Cathedral to the soldiers of all ranks from the neighbourhood who have fallen in the South African war. Leicestershire, Rutland, Cambridgeshire and Lincolnshire will be asked to co-operate with Northamptonshire in the matter.

**Excavations** for the foundation of a new railway station at Metz have just brought to light the remains of a Roman theatre 438 feet long.

**Mr. John Thomas Bellows**, of Upton Knoll, and of Eastgate Street, Gloucester, printer and publisher, and a prominent archaeologist, who died on May 5, aged seventy-one, bequeathed his collection of antiquities to the Gloucester Museum.

**A Sanatorium** is likely to be erected by the South Wales and Monmouthshire Branch of the National Association for the Prevention of Consumption to accommodate twenty patients. The building will cost 5,000*l.*, and the maintenance will be 1,600*l.* per annum.

**An Exhibition** showing how design is taught in Japan, and especially in Tokio, has been organised in Paris by M. Felix Regamey. Examples from elementary classes, as well as from the higher art classes, are shown. They suggest that in the schools at least tradition has more power than nature.

**The People** of Lancaster have decided to re-erect the ancient Covell Cross on the site of the old Roman basilica as a memorial of King Edward's Coronation and a thank-offering for his recovery. An influential committee has been appointed to carry out the scheme. The site is opposite to the present Judges' apartments.

**The Villa Borghese** in Rome was to be sold to-day. But a guarantee has been given in the name of the Italian Government and the municipality of Rome that the property will be purchased for public purposes. This has been decided on in order to prevent foreigners obtaining possession of the villa.

The King of Italy will contribute a large sum towards the fund.

**The Reservoir** at Upper Neuadd, which has a capacity of 350,000,000 gallons of water and a water surface of 59 acres, has been opened. The cost has been 138,000*l.*, and is the last of three constructed for the Merthyr Waterworks. A solid masonry embankment stretches across the valley, and is surmounted in the centre by a prominent tower containing the balancing tank for hydraulic purposes. It has been almost wholly built out of Welsh materials. The masonry was constructed with Welsh stone and Welsh lime, and no cement from England or abroad had been needed. The consulting engineer was Mr. G. F. Deacon.

**The "Danae"** of M. Carolus Duran is to be acquired by the Municipal Council of Bordeaux in spite of the protestations of some of the members. The price to be paid is 12,000 francs.

**Lord Cheylesmore** has bequeathed his collection of English mezzotint portraits, which numbers several thousands, to the nation. They will shortly be deposited in the British Museum. Among the works is an example by Prince Rupert.

**Operations** are in progress for the protection of the spire of Salisbury Cathedral against lightning. The former conductors will be removed, and a more modern system of continuous copper tapes substituted.

**Vauxhall Bridge** is not progressing so quickly as had been anticipated. It will not be possible to enter into a contract for the superstructure before next year. The delay might to some extent be attributed to natural and other difficulties which had presented themselves. Not the least of these had been the rather stringent restrictions imposed by the Thames Conservancy in their efforts to secure non-interference with the traffic of the river. From time to time the contractors had been urged to press forward the work under their contract for the demolition of the old and the partial construction of the new bridge, but they had stated that they would be unable to finish before the end of this year.

**The First Commissioner of Works** has stated that he was ready to make arrangements by which a moderate sum might be yearly appropriated to the redecoration, or completion of the decoration, of the Palace of Westminster on a more systematic basis than had hitherto been the case.

**Stoppages of Sewers** by roots of trees made it necessary to relay over 19,500 feet of pipes in the system at Berlin in 1900. The joints are now made with oakum and asphalt in order to avoid such trouble on new lines.

**The Melbourne and Metropolitan Board of Works** have accepted a recommendation of the Officers' and Servants' Committee to the effect that the wages of bricklayers employed by the Board should be reduced from 11*s.* per day per week of forty-eight hours to 10*s.* per day.

**The Portland Cement Industry** in the United States in 1901 is reported by the United States Geological Survey to have turned out a little over 12,710,000 barrels, an increase of about 4,230,000 barrels over the product of 1900. The imports during 1901 were under 940,000 barrels. The production of natural cement in 1901 was about 7,850,000 barrels, and the output of slag cement was about 273,000 barrels.

**An International Exhibition** is proposed to be held next year in Manchester. It will comprise the world's latest inventions in machinery, scientific research, aerial navigation, education, photography, agriculture, mining and other industries, and the fine arts. The promotion is in the hands of exhibition experts, and already plans and designs have been drawn out. If the scheme develops as planned the larger portion of the profits will be handed over to the local charities, and more especially to the hospitals.

**The First Section** of the contract for constructing a new dock at Chatham has been practically completed. The dock is built of concrete faced with granite and Portland stone. The length of the groundwork is 712 feet, the length from the outside of the caisson to the head being 650 feet. It is expected that the new dock will be completed and ready for use at the beginning of the new financial year.

**We are requested** to state that the appointment of Mr. Hornblower as architect to University College Hospital, recently announced in the architectural journals, is not connected with the completion of the new buildings now in course of erection from the design of Mr. Alfred Waterhouse, R.A. On the retirement of Mr. Waterhouse in April last, Mr. Paul Waterhouse was appointed by resolution of the hospital committee to carry these important buildings through to their completion, a selection which was confirmed by Sir J. Blundell Maple, Bart, M.P., the donor of the entire fabric.

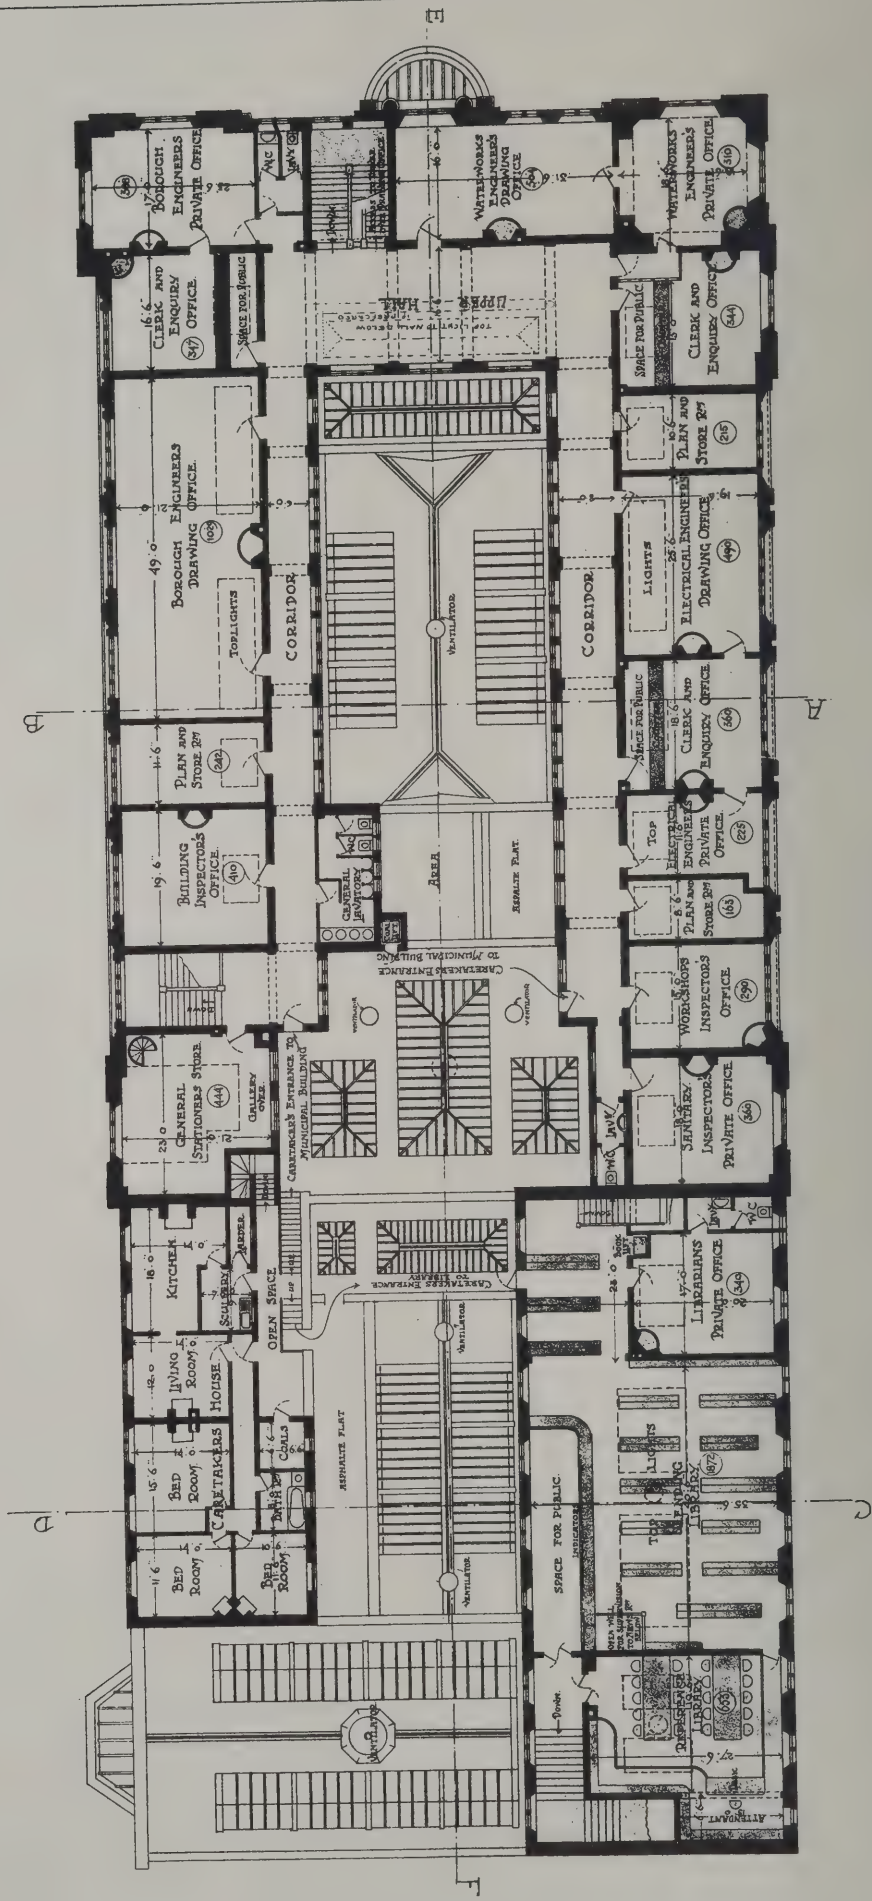

**The Wesleyan** general chapel committee has sanctioned the erection of twelve new chapels, at an estimated cost of 56,000*l.*, with accommodation for 5,300. One is at King's Road, Chelsea, and another at Finchley. The expenditure sanctioned by the committee during the year is 626,000*l.*

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**BERMONDSEY.**—Sept. 16.—Designs are invited for artisans dwellings to be erected on land at Rotherhithe, within the borough of Bermondsey, and known as the Fulford Street area. Premiums of 100*l.*, 60*l.* and 40*l.* will be awarded. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**BIDEFORD.**—Sept. 25.—The Town Council of Bideford are about to erect municipal offices and a public library upon a site opposite the west end of the Long Bridge, Bideford, and they invite designs for the proposed buildings. Premiums of 30*l.*, 15*l.* and 10*l.* respectively are offered for the designs which shall be placed by the Council first, second and third in order of merit. Designs and descriptions, &c., are to be delivered to Mr. Wm. B. Seldon, town clerk, 18 The Quay, Bideford.

**CLACTON-ON-SEA.**—July 26.—Plans are invited for erection of a new school in Holland Road, Great Clacton, for 500 children, showing enlargement for an extra 300 children. Mr. Charles E. White, clerk, Wellesley Road, Clacton-on-Sea.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford S.E.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**SOUTHEND.**—Sept. 7.—Designs are invited for a church to accommodate 500 persons, a clergy-house, and a parochial hall or parish-room about 50 feet by 30 feet. Mr. C. H. J. Talmage, Kathleen Villa, Southchurch Road, Southend-on-Sea.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

PYROCHROM.

A NEW discovery in decorative work, which is at once elegant, eminently artistic, permanent and relatively inexpensive, has just been perfected, and specimens may be inspected at 369 Oxford Street, W.

Pyrochrom is the name applied to a newly-discovered process by which the most artistic effects are produced on plain or silvered glass in translucent colours, which are applied in such a manner as to be equally perfect whether viewed from front or back. By its means windows, glass doors, &c., can be decorated in a highly effective manner. The most striking results, however, are perhaps attained in the case of mirrors, panels, &c., the effects produced by these when lighted from behind by electricity, gas or other illuminant being strikingly beautiful.

The process is obviously of the greatest value in the decoration of private houses, hotels, cafés, restaurants, &c., especially in buildings of a public nature, as it is practically indestructible. It also has a wide field for advertising purposes, effective tablets or pictures of a durable nature being produced at very small cost.

The following are among the advantages which the Pyrochrom Company claim—and, as it appears to us, with justice—for their new and very artistic production :—

*Perfection and Clearness of Colour.*—Not merely every colour, but every subtle shade is reproduced on the glass more faithfully than by an artist's brush or pencil. The lines of the picture are strikingly clear and distinct.

*Durability.*—In consequence of the nature of the process

The "ONE" Range.

PATENT 1331/01.  
M. F. Co. LD. R.

These Ranges are Exhibited by the following London Firms:—

- R. ADAMS, Newington Causeway;
- CLARK, HUNT & CO., Shoreditch;
- O'BRIEN, THOMAS & CO., Upper Thames Street;
- R. H. & J. PEARSON & CO., Ltd., Notting Hill Gate;
- BROWNSON, DREW & CO., Queen Victoria Street.

Agents for Liverpool:—  
THE WELL FIRE CO., Ltd.

The above shows the heat concentrated under the boiler and the waste heat passing under the not plate.

This Independent Range is fitted with hot water circulating boiler as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The casing and oven door are lined with slag wool and a third oven can be arranged if required.

employed the colours are to all intents and purposes everlasting.

*Magnitude of Design.*—In the old and mosaic process every colour, every shade even, demanded a separate sheet of coloured glass, which had to be cut and fitted by a skilled glazier, and the joining lines hidden as well as could be by strips of metal, or "stippling," and by various other makeshifts. Pyrochrom presents one unbroken surface, thus adding greatly to the general effect of the picture.

*Cheapness*—By Pyrochrom a perfect and lasting picture can be obtained at such a price as to bring it within easy reach of the million.

PLANS for the erection of that section of the new Glasgow and West of Scotland Technical College and Science and Art Buildings, which is to occupy the ground recently acquired from the School Board of Glasgow and the site of Anderson's College, have now been passed by the Dean of Guild Court. The new buildings are in the Renaissance style, and are to be built of red sandstone, and constructed to accommodate altogether 5,000 students—a number slightly in excess of those attending the college at the present time. The plans show a structure of imposing size and architectural elegance, one which will form a valuable addition to the public buildings of the city. The portion to be erected at present will run parallel with Montrose Street. On the ground floor will be accommodated the department of natural philosophy. With the exception of two or three rooms to be used for general purposes, the second floor will be devoted to the department of natural science. The third floor will provide accommodation for the department of architecture and building construction, while the chemical department and the department of technical chemistry will be housed on the top floor, the whole of which they will practically occupy in the completed building. Behind the Montrose Street section of the college, and running parallel to it, will be three blocks of buildings. The first block will contain a portion of the electrical engineering department, but will be principally occupied by the examination hall. In the next block the remainder of the electrical engineering department will be housed, while the third block will embrace rooms for woodworking classes and the department of mining and geology. A wing connecting the three blocks will be occupied by the department of prime movers, mathematics and metallurgy. Mr. David Barclay, St. Vincent Street, is architect of the new technical college.

### THE SANITARY INSTITUTE.

THE preliminary programme of the nineteenth congress, to be held in Manchester from September 9 to September 13, has now been issued. The president of the congress is the Right Hon. the Earl Egerton of Tatton. Mr. W. N. Shaw, F.R.S., will deliver the lecture to the congress, and Sir W. J. Collins, M.D., the popular lecture. Excursions to places of interest in connection with sanitation and a conversazione will be arranged for those attending the congress. It appears from the programme that over 300 authorities, including several county councils, have already appointed delegates to the congress, and, as there are also over 2,500 members and associates in the Institute, there will probably be a large attendance in addition to the local members of the congress. In connection with the congress a health exhibition of apparatus and appliances relating to health and domestic use will be held as a practical illustration of the application and carrying out of the principles and methods discussed at the meetings; it not only serves this purpose, but also an important one in diffusing sanitary knowledge among a large class who do not attend the other meetings of the congress.

The congress will include three general addresses and lectures. Three sections meeting for two days each, dealing with (1) sanitary science and preventive medicine, presided over by Sir James Crichton-Browne, M.D.; (2) Engineering and architecture, presided over by Sir Alexander Binnie; (3) Physics, chemistry and biology, presided over by Professor A. Sheridan Delepine. Eight special conferences—Municipal representatives, presided over by Alderman Alexander McDougall, J.P.; port sanitary authorities, Alderman Walton Smith, J.P.; medical officers of health, presided over by Dr. James Niven; engineers and surveyors to county and other sanitary authorities, presided over by Mr. Charles Jones, C.E.; veterinary inspectors, Mr. W. Augustus Taylor; sanitary inspectors, presided over by Mr. W. Bland; domestic hygiene, presided over by Mrs. W. O. Meek; hygiene of school life, presided over by Professor C. S. Sherrington.

The local arrangements are in the hands of an influential local committee, presided over by the Lord Mayor of Manchester, with Mr. J. H. Reynolds, principal of the Municipal School of Technology, as honorary secretary.

## THE UNION PLATE GLASS CO., LTD., POCKET NOOK, ST. HELENS

Telegrams, "Union St. Helens." Nat. Tel. 48.

## TRADE NOTES.

MESSRS. W. POTTS & SONS, clock manufacturers, Guildford Street, Leeds, have received instructions to make and fix a chime clock in the tower of Moorsholm Church, North Yorkshire, from Mr. R. R. Petch.

THE new infectious diseases hospital, Newcastle-under-Lyme, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves, with descending smoke flues, by Messrs. E. H. Shorland & Brother, of Manchester.

THE New Guide Book for purchasers just issued by Messrs. J. W. Benson, Ltd., of Ludgate Hill and Old Bond Street, is one of the handiest books we have seen for general information to all those anxious to possess a watch, chain or a ring, to a fitted travelling case, on the monthly payment system, which J. W. Benson still have in vogue, this plan continuing to meet with great success.

MESSRS. G. M. RESTALL & SON, adamantine plaster manufacturers, of Soho Pool Wharf, Birmingham, who have, by the way, just attained their majority, having been established upwards of twenty-one years, are sending out a newly revised circular descriptive of their plasters and cements, and containing instructions for their use and an enumeration of the uses to which they can be applied, as well as a list of the buildings in which they have been employed and another of names of builders and contractors who have successfully used them.

MESSRS. JOHN KING, LTD., the warming and ventilating engineers, of Liverpool, with a view to meeting the convenience of their clients in London and the Southern counties, have opened offices at No. 7 Quality Court, Chancery Lane, London, to which all inquiries should be addressed. Messrs. King have recently fitted up their well-known heating apparatuses for the Duke of Westminster, the Marquis of Cholmondeley, the Earl of Derby, the War Office, and H.M. Board of Works; and the firm's contract for the warming and ventilating of the new lunatic asylum at Portrane, co. Dublin, amounting to nearly 20,000l., which is the largest contract that has ever been let in Great Britain for work of this sort, is rapidly approaching completion.

## ELECTRIC NOTES.

THE units of electricity generated in Greenock during the four weeks ending June 28, numbered 22,235, 17,505 being

sold, or 9,066 more than for the same period last year. For traction purposes 55,865 units were supplied. The applications for supply now number 277, which is equivalent to 35,418 8 candle-power lamps.

AT a special meeting of the Renfrew Town Council a notice was read from the Electrical Supply Corporation intimating that they intend to apply during next session for a provisional order under the Electric Lighting Acts, and if obtained they intend to exercise the statutory powers conferred by these Acts within the burgh. After consideration, the Council agreed to oppose the application.

AT a meeting of the Kilmarnock Town Council the electric committee reported that they had offered Mr. Bryson, who had been appointed engineer for a scheme of electric lighting in the burgh, a sum of 330l. as a settlement in full of his claim and expenses, in consequence of the scheme having been in the meantime abandoned, and that Mr. Bryson, whose original claim was 976l. 17s. 3d., had signified his willingness to accept this sum.

THE West Ham Borough Council, who were the first body in the east of London to light their district by electricity, have just accepted a tender amounting to 108,900l. for the construction and equipment of a system of electric trams for the borough. The southern districts—Plaistow and Canning Town—will be chiefly benefited by the enterprise of the Council. The rails are to be made in England, and it is hoped as far as possible to employ men in the constructional works who reside in the borough.

AT the monthly meeting of the Town Council, on the motion of Bailie Service, a committee was appointed to consider the advisability of applying to Parliament for a provisional order giving the Council the right to become the distributors of electricity within the burgh. As a result of opposition to the Clyde Electric Power Bill, a clause was inserted giving Dumbarton and Kirkintilloch power to apply for such an order within a specified time, without the opposition of the company. In answer to a councillor, the clerk said that if they obtained this order, which was likely, work would have to be proceeded with within a specified time.

AN important movement, having for its object the supplying of electricity for lighting and traction purposes throughout Carnarvonshire, has just been set on foot by Sir William Preece, K.C.B., and Mr. Charles H. Rees, Carnarvon. In the course of an address at the Cymmwdorion section of

the National Eisteddfod, held at Carnarvon in 1894 on the industrial resources of Wales, Sir William Preece referred to the unusual facilities afforded by the district for an electric installation on a large scale. Since then various schemes have been propounded, but it is only now that anything like a workable scheme has been presented. It is proposed not only to introduce electric light into the populous centres of the county, but to construct electric tram lines and to seek the co-operation of quarry-owners with the view to the substitution of electricity for steam-power. The movement has already met with considerable support, and although a very large sum will be needed to carry out the scheme, it is believed there will be no difficulty in raising the necessary capital. Several smaller schemes for isolated districts have for some time been maturing, but it is felt that one large and comprehensive scheme for the whole county is more likely to be carried to a successful issue. In order to further discuss and consider the proposals an influential county meeting is to be held at Carnarvon on the 14th inst., when Sir William Preece will explain his views and enter fully into the details of a project which cannot fail to have a most beneficial effect on the industries of the whole district.

### VARIETIES.

THE new church which has been erected in St. Stephen's parish of Smethwick will be consecrated on the 25th inst. by the Bishop of Lichfield.

THE members of the Durham Archaeological Society made a two days' excursion to North Yorkshire on Thursday and Friday last week, Canon Greenwell, F.S.A., acting as cicerone.

AFTER being closed for two months for renovations, High Street Methodist New Connexion chapel, Huddersfield, was reopened on the 10th inst. The whole outlay will be between 800*l.* and 1,000*l.* There was already a debt on the chapel of 1,500*l.*, and a bazaar is to be held next May to raise 2,000*l.*

ON the 12th inst. at Morecambe the opening took place of the new United Methodist Free church, Sandylands, erected to meet the needs of the west end of the town. The new building is of stone, the interior being pitch-pine, with stained-glass windows. The cost of the building and land was 7,388*l.*

AN important extension of the Southern Outfall sewage works of the Ossett Corporation has been recently carried out

at an outlay of about 9,200*l.* Thirty-two acres of additional land have also been acquired for sewage treatment. The extension was formally opened on Monday.

THE new district wash-houses erected by the Dundee Town Council at Constable Street were opened last week. They have cost 7,140*l.*, while the cost for the wash-houses and baths at Caldrum Street, which will soon be opened, is 5,746*l.*, the total expenditure on the two places being 15,126*l.*

IN view of the strong opposition manifested at the inquiry respecting the site selected by the Kettering Urban Council for their refuse destructor, and the suggestions that there were other sites less open to objection, the Local Government Board thought it desirable that the Urban Council should further consider the matter.

A BRITISH and Colonial Industrial Exhibition, under the patronage of Lord Milner, Sir J. Gordon Sprigg and other Cape magnates, will be held in Cape Town during the months of November, December, January and February, 1903 and 1904. The manager will be Mr. A. P. Baker, F.R.C.I., of Cape Town. An English office has been opened at Seymour Grove, Manchester.

THE *Standard* Berlin correspondent telegraphs:—According to reports from Stockholm the plans for a new canal between Gothenburg, on the west coast of Sweden, and Wenersburg, on the large Wener lake, have now been drawn up on the basis of the surveys instituted in 1900. This enterprise is intended by the Swedish Government to supplement the old canal connecting the Baltic with the North Sea, which is no longer able to cope with a traffic doubling itself every twenty years. The new canal will take from seven to eight years to construct, and will cost 32,000,000 Scandinavian crowns. The depth will be about 20 feet, which will allow vessels of a tonnage up to 4,100 tons to pass through. Its yearly carrying capacity is estimated at a maximum of 20,000,000 tons.

THE Midland Railway Company have just opened at the Sandon and Canada Dock station, Liverpool, new provision warehouses, with cellars for the storage of bacon, lard, butter, cheese, &c. Built of brick, with concrete floors, and practically fireproof, the new station is centrally situated on the line of docks, and merchandise of all kinds can be rapidly transferred from ship to warehouse. All kinds of provisions requiring storage at a low temperature will be specially accommodated

## "TAYLOR'S PATENT JUNCTION"

No. 12662.

For WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &c.

APPROVED BY ALL SANITARY AUTHORITIES.

THIS Junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the many angles required for the various makes, also to avoid the necessity of having joints inside the walls, which are dangerous and not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction can be adapted to any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this article, as it only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required. A perfect Gas and Watertight Joint can be made in a few minutes by any ordinary Plumber. In fixing this Joint, all that is necessary is to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back the Lead Pipe  $\frac{1}{2}$  inch all round, coat the face of Flange with a little Red Lead Putty, bring the two Faces together and draw up with the Bolts, screwing up each Bolt a little at a time until they are all tight, then the Joint is made and will stand any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all that is required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left intact. With all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Property and causing other inconvenience.

A—Is the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut to any required angle.

B—Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.

C—Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in.  $\times$   $1\frac{1}{2}$  in. Invert Junction for Anti-siphon Pipes, &c.

D—Shows how to arrange for a small sized branch.

Made in Three Strengths—Ordinary Rain Water,  $\frac{1}{2}$  and  $\frac{3}{4}$  Metal.

PRICES AND PARTICULARS CAN BE HAD AT ALL WHOLESALE MERCHANTS, OR FROM

CHARLES TAYLOR, R.P., Sanitary Engineer, ECCLES, MANCHESTER.

## MAUGHAN'S PATENT GEYSER

6 HOLYWELL ROW, FINSBURY,  
LONDON, E.C.

NEW CATALOGUE FREE ON APPLICATION.

in the cellars and warehouses. They are fitted with hydraulic and electric overhead travelling cranes, lighted throughout with electricity, and with all modern appliances for the quick handling of goods, both into and out of store direct into railway trucks. Bills of lading and other communications should be addressed to Mr. R. A. Warren, chief goods office, Victoria Street, Liverpool, from whom rates and further information may be obtained, or from Mr. W. E. Adie, goods manager, Midland Railway, Derby.

A PORTION of an old brass showing the dress of a female effigy was found some years ago in the ancient parish chest in Holy Trinity Church, Stratford-on-Avon, and by direction of the vicar the brass was preserved. It has just been shown to the Rev. J. Harvey Bloom, rector of Whitchurch, near Stratford, a well-known antiquarian, who has pronounced it to be part of the effigy of Agnes Pagette, wife of the famous Master of the Guild of the Holy Cross, which was founded in Stratford about the twelfth century. The inscription on the brass is recorded in Dugdale's "History of Warwickshire," and the brass itself has long been lost. The recovery of a portion of it has excited a good deal of public interest, and the vicar and churchwardens have been asked to show it in a conspicuous position in the church.

THE new textile school in connection with and adjoining the buildings of the Heginbottom Technical School, at Ashton-under-Lyne, was opened on the 5th inst. by the mayor of Ashton (Mr. J. B. Pownall). The building, which consists of two storeys, has taken nearly two years to erect and to equip with the necessary machinery, and has cost about 7,000*l*. The movement owes its inception to the public spirit of Mr. Councillor Barlow, the late Mr. Alderman Marland, Mr. Samuel Newton, Messrs. Hetherington & Sons, of Manchester, and others. Every department of an up-to-date cotton mill is represented. There are, in addition, two complete sets of spinning and weaving machinery, jacquard and other looms for pattern weaving, power and light being supplied by electricity.

ON Friday last about twenty members of the Liverpool Engineering Society visited the extensive quarries of Messrs. Darbshire, Limited, Penmaenmawr, on the invitation of Mr. C. Darbshire, a past president of the Society, and after luncheon inspected the quarries and all the numerous stages in the preparation of macadam, &c. Amongst other interesting items a big blast had been arranged for on a given signal by means of an electrical cable. A charge of nearly half a ton of

powder was fired, displacing a mass of stone from the mountain's side, accompanied by a terrific explosion. An exhibition of sett-making was also given. After the quarries had been inspected the party partook of dinner at the residence of Mr. C. Darbshire. Mr. Wilcox proposed a vote of thanks to the host and hostess, to which Mr. Darbshire replied. After a stroll round the grounds the party broke up. Amongst the gentlemen present were Messrs. F. Priest, Wilcox, A. W. Duncanson, A. Leighton, B. Cunningham, G. C. Kenyon, &c.

A COMMODIOUS and attractive open-air swimming-bath, which has been constructed for the benefit of the residents of Port Sunlight, was formally opened by Lord Stanmore, G.C.M.G., on the 5th inst. The bath is very centrally situated, being on land to the north of Bolton Road, and is built on the most modern principles, both as regards health and convenience. The shape of the bath is oval and its measurements are 100 feet long, 75 feet across, 3 feet 6 inches deep at the shallow end and 7 feet 3 inches at the other end. Here a capital diving platform has been erected, the highest point for diving being about 25 feet. Separate dressing-boxes and large dressing-rooms for boys have been erected, and altogether the bath is excellently equipped, and is bound to prove itself of great advantage to the residents of the district. It has cost 2,617*l*.

ON Saturday the 5th inst. members of the Bristol rowing world assembled to witness the formal opening by the Lord Mayor of the new and commodious boat and club house which the Redcliff Rowing Club has just erected. The house, a two-gabled and two-storeyed one, is 54 feet by 17 feet wide. The foundation is piled, and on the lower floor is accommodation for twenty boats, which can be run along a platform to water level. The upper storey consists of three rooms, the central one being a large, well-arranged dressing-room for men. To the right is situated a ladies' room, which is divided by a movable partition, so that on those occasions when the whole building is placed at the disposal of the sterner sex the two rooms can be thrown into one for gymnastics or smoking concerts. On the left of the men's room are a couple of shower baths and lavatories. Verandahs on either side of the building overlook the river, and on the Bristol Bridge side staging has been built for pleasure boats, while on the other side there is a similar structure for use by those who go in for rowing seriously. The interior woodwork is of Carolina pine, the light character of which gives the place a bright and comfortable appearance. The fittings throughout are of an up-to-

date character, and electric light has been laid on throughout. The cost of the building amounts to about 600*l*. The work has been carried out by Messrs. T. Lovell & Sons, from plans prepared by Mr. James Hart, of Corn Street.

THE sanitary committee of the Leeds City Corporation spent a considerable time recently discussing the laundry arrangements in connection with the new fever hospital at Manston and the smallpox hospital at Killingbeck. Various methods of effecting the necessary alterations and improvements have been debated from time to time, these ultimately taking shape in the scheme now resolved upon, by which the number of boilers at Manston will be doubled, and an extension of the premises carried out in accordance with plans submitted by the architect to the committee. The Manston Hospital laundry will also be lighted by electricity, as will be that at Killingbeck; but the latter will be heated by steam generated at Manston, and supplied with light from the same place. It was the doubt which some members felt as to the feasibility of conveying the steam unexhausted through pipes from Manston to Killingbeck which led to the lengthy discussion of the subject, though the distance being only about a quarter of a mile, expert opinion showed that the plan was perfectly workable, and indeed something similar was already being done elsewhere.

### BUILDING AND BUILDERS.

AT Birkenhead last week the foundation-stone was laid of a new Sunday school in connection with the Oxton Road Congregational church, designed by Mr James H. Cook. The building, which includes a hall capable of holding 440 adults, has been constructed at a total cost of 3,500*l*.

THE contract has been let for the erection of a mission church on Eccles New Road, Manchester. The new building will be attached to St. Luke's and the site is half-way between Weaste and Eccles. The building will be principally terracotta with stone dressings, and will cost upwards of 4,000*l*.

THE foundation-stone was laid on the 6th inst. at Woodford Halse, Northants, of a new voluntary school, which is to cost about 900*l*. The school, which was designed by Mr. W. E. Mills, of Banbury, will contain a schoolroom 35 feet by 20 feet, and two classrooms 20 feet square. It is expected that the building will be completed about next Christmas.

THE Mayor of Swansea announced at the monthly meeting of the Harbour Trust that the new stock, amounting to 350,000*l*, recently raised would enable the Trust to commence the construction of the projected new dock at an early date. The scheme will cost two million pounds.

MEMORIAL-STONES have been laid for a new Wesleyan Methodist mission-hall in Cowley Road, Walton. The hall is being built to meet the needs of a large new residential neighbourhood on the west side of Anfield cemetery, and is an extension of the work of Kirkdale Wesleyan chapel.

THE foundation-stone has been laid of St. Columba parish church, which is to be built on a site in St. Vincent Street, Glasgow. The new church replaces the building in Hope Street, which had to be removed two years ago in connection with the operations of the Caledonian Railway Company, and which was one of the churches in the city in which Gaelic services were regularly held.

IT is reported that a well-known and old-established firm of ironmasters in the Black Country are contemplating laying down at an early date a new forge and rolling mills on the site formerly occupied by the blast-furnaces which were carried on successfully for a great number of years by Messrs. Bennett & Co., and latterly by an Oldbury brick company. The prospects of the iron trade in this portion of the Black Country are said to be improving.

THE tender of Mr. Thomas Rowbotham, builder and contractor, Coventry Road, Small Heath, for the foundations of the new buildings of the Birmingham University, has, we understand, been accepted. The amount of this contract will probably be between 40,000*l*. and 50,000*l*. Last week Mr. Rowbotham also secured the contract for the erection of a workhouse and infirmary at Wormwood Scrubs for the Hammersmith Board of Guardians, the amount of the tender, particulars of which we published, being 187,777*l*.

A NEW fire station is about to be erected on the site on which stood The Cedars, at the junction of Grafton Square and Old Town, Clapham. The freehold cost 3,000*l*, and on it it is intended to erect a building which shall be the superintendent's station for the E district. Mr. A. A. Allen, the chairman of the fire brigade committee of the London County Council, laid the foundation-stone on Saturday, and was thanked on behalf of the inhabitants by the Mayor of Wandsworth.

THE Town Council of Pittenweem, N.B., has agreed to carry out, at a cost of about 700*l.*, a scheme by Mr. Currie, architect, Elie, for altering and improving the present sewage of the burgh, with the view of giving effect to the recommendations of Professor Hunter Stewart, who, at the request of the Town Council, recently reported on the sanitary condition of the burgh in connection with the frequent outbreak of typhoid therein.

It was the wish and intention of those who originally designed Trinity Congregational church, Reading, that at some future date it should be surrounded by a fence in keeping with the general appearance of the church itself. Wednesday, the 9th inst., saw the commencement of the carrying out of that wish, when Sir Peter Spokes "well and truly laid" the foundation-stone of the wall now in course of erection. The new fence will consist of a dwarf wrought-iron railing on a low battering wall of Swindon stone coped with rubbed Robinhood stone. The fence will be constructed in panels, piers of Swindon stone with Robinhood stone caps occurring at intervals between the panels of railing. There will be four sets of double-entrance gates and one single gate of wrought-iron, all hung to massive square piers. The whole of the work is being executed from the designs and under the supervision of Messrs. Ravenscroft, Son & Morris, architects, Reading.

THE foundation-stone was laid last week of the new women's infirmary in connection with the union workhouse at Stratford-on-Avon. The scheme includes a new laundry, fitted with the latest engineering appliances, the total cost of the works (exclusive of furnishing) being about 7,000*l.* The stone-laying was of a semi-private character, and was performed in the presence of the Guardians and a few friends by Mr. J. Cove Jones, who for over twenty-three years has filled the position of chairman of the Board. The Guardians have accepted the tender of Messrs. J. G. Fincher & Co., of Stratford, to erect the new laundry for the sum of 1,415*l.*, and the offer of Messrs. Barford & Perkins, of Peterborough to carry out the engineering work for 1,819*l.*

THE thirteenth annual picnic in connection with the North Staffordshire Builders' Association took place on the 10th inst., when a visit was paid to Warwickshire. A special train left Stoke-upon-Trent at 8.20 in the morning for Coventry. The party consisted of about 300, comprising members of the Association, their wives and friends. The arrangements were carried out by Mr. J. Bowden, secretary. The visit to St.

Michael's Church and St. Mary's Hall could not take place owing to the late arrival of the train, so the party proceeded at once to the King's Head hotel. After lunching they drove to Kenilworth Castle, a distance of five miles, along a road which is interesting from its historical associations. On returning to Coventry the party proceeded to Bournville for the purpose of seeing this model village.

NINETEEN master and operative plumbers applying for registration under the National Registration of Plumbers attended for examination on Saturday at King's College by the Worshipful Company of Plumbers. The candidates were from various parts of London, and also from Bedford, Egham, Redhill, Rochester and Saffron Walden. The practical test included lead-bossing and the making of plumber's joints, &c. The examination questions included the subjects of contamination of drinking-water from faulty connections, roof covering, arrangement of bath, sink and closet wastes, drainage of town houses and disconnection with sewers. The examiners were Mr. Charles Hudson, master plumber, chairman of Board of Examiners; Mr. J. Knight, master plumber; and Messrs. F. Oakes and G. Wilson, representing the United Operative Plumbers' Association of Great Britain and Ireland. Nine candidates succeeded in passing the examination.

AN important and expensive work was inaugurated at Sealand on the 7th inst., when the first sod was cut of the new purification works for Chester. The new works, which were rendered necessary in consequence of the old outfall works being inadequate to meet the increasing requirements of the city and district drainage area, are situated on the east of and adjacent to the present works, and embrace about an acre of land purchased by the Corporation for the purpose. On this site will be constructed the tanks and filter-beds in which the sewage will be subjected to bacteriological treatment. To cover the cost of the scheme the Corporation have borrowed a sum of 56,000*l.* The ceremony, which was of a simple nature, was attended by the Mayor and a number of city councillors and others interested in the undertaking. Councillor John Jones, chairman of the sewerage committee, gave a short description of the proposed works, and the Mayor thereafter cut the first sod for the first tank, and Councillor Jones a sod for the first filter. The Mayor was presented with a miniature silver spade by Major Tulloch, and a similar memento was presented to Councillor John Jones by Messrs Underwood Brothers.

**ELECTRIC LIGHTING IN TRURO.**

THE Corporation of the city of Truro have resolved to consider the question of lighting the city by electricity. A special committee has been appointed for this purpose, of which Mr. Silvanus Trevail, P.S.A., has been elected chairman. The following report was presented and adopted at the last meeting of the Council:—

*Supplementary Report.—Electric Lighting Committee, June 25 and July 3, 1902.*

Your committee met on the above dates and beg to make the following report and recommendations:—

1. That the town clerk be instructed to advertise in the *Electrician* and the *Electrical News* as follows:—

*Electric Lighting Committee.*

The electric lighting committee of the city of Truro are prepared to receive proposals for the electric lighting of the city on or before July 31 instant.

2. Having considered notices of intention to apply for provisional orders from Messrs. Deacon & Co., the United Electric Light and Power Company and the Provincial Electric Supply and Traction Company for the purposes of supplying electricity within the Council's area, your committee recommend that the town clerk write and inform them that the Council have already an electric lighting order for the city of Truro, and will be glad to receive suggestions from any firm relative to an electrical lighting installation.

(Signed) SILVANUS TREVAIL, Chairman.

**THE LONDON COUNTY COUNCIL HOUSES.**

A REPORT from the housing of the working classes committee embodies the accounts in respect of the Council's working-class dwellings and the Parker Street lodging-house tenements for the year ended on March 31 last. The dwellings mentioned in these accounts comprise 2,591 tenements, 358 cottages and 324 cubicles, providing accommodation for a total of 15,952 persons, whilst those mentioned in the previous year's accounts comprised 2,041 tenements, 305 cottages and 324 cubicles, providing accommodation for 12,196 persons. The following is a list of the new dwellings which have been opened during the year to which the accounts refer:—Rossetti Buildings, Millbank Estate, accommodates 290 persons; Lowood and Chancery

Buildings, Cable Street, Shadwell, 276; Hardy Cottages, Trafalgar Road, Greenwich, 306; Toronto and Montreal Buildings, Cotton Street, Poplar, 360; Adelaide Buildings, Ann Street, Poplar, 190; Battersea Bridge Buildings, 278; Reynolds Buildings, Millbank Estate, North Block, 200; East Block, 205; Mulready Buildings, Millbank Estate, 230; Maclise Buildings, Millbank Estate, 296; Landseer Buildings, Millbank Estate, 230; total, 2,856. Since the end of the year to which the accounts relate up to the present date the following new dwellings have been opened for occupation:—Fletcher Buildings, Duke's Court site, accommodation, 230 persons; Battersea Bridge Buildings, Folly Cottage, 8; Lawrence Buildings, Millbank Estate, 296; Beaumont Buildings, Duke's Court site, 190; Sheridan Buildings, Duke's Court site, 190; Morland Buildings, Millbank Estate, 300; total, 1,214.

The total gross income for the year amounted to 58,058*l.* 15*s.* 6*d.*, and of this 53,315*l.* 14*s.* 4*d.*, or 91·83 per cent., was required for outgoings during the year, as against 94·76 per cent. required during the year 1900-1. There is thus a surplus balance on the year's working of 4,743*l.* 1*s.* 2*d.* The outgoings include central office charges, the cost of local supervision and collection of rent, rates and taxes, lighting, water and insurance, stores and incidentals, an amount set aside for the cost of repairs and renewals, together with interest and sinking fund charges in respect of debt. Of these items, rates and taxes have increased in almost every case, but economy has been effected principally under the head of lighting, water and insurance. With regard to the amount set aside for repairs and renewals, after paying for all repairs a sum of 11,125*l.* 12*s.* remains to the credit of the repairs and renewals fund, as compared with 8,934*l.* 18*s.* 2*d.* on March 31, 1901. This forms a reserve to meet the heavier expenses under this head which may be expected as the dwellings become older. The committee observes:—"In some few cases difficulty has been experienced in letting tenements, notably at Battersea Bridge Buildings; but on the whole the average loss of rent by empties has been comparatively small. The amount of rent written off as irrecoverable represents only 10*s.* per cent. of the rent receivable. The accounts show that, taking one year with another up to date, there is, as a whole, no deficiency on income account as a result of the Council deciding itself to erect and manage dwellings; that is to say, the balances in hand in respect of all the dwellings are now such that all previous contributions from the rates

# Easton's

## Express

## Electric

## Lifts.

BROAD SANCTUARY CHAMBERS,

WESTMINSTER, S.W.

might be repaid, and the accounts would still show a surplus balance. This we cannot but regard as a satisfactory state of affairs. The total expenditure on capital account on all the dwellings up to March 31, 1902, amounted to 931,459*l.* 3*s.* 1*d.* This sum represents the actual payments made up to that date, and does not include liabilities under contracts for buildings in course of erection. Though the net result of the year's working of all the dwellings erected by the Council shows that there is no charge on the county rate in respect of such dwellings as a whole, it will be seen from the accounts that where debit balances obtain they are chiefly in respect of dwellings erected under Improvement Acts, whereas the credit balances are chiefly in respect of dwellings erected under the Housing of the Working Classes Act. We are advised that owing to the fact that the money to make good any deficiency must, in the case of dwellings erected under the Housing Act, be provided out of the special county rate, and in the case of dwellings erected under Improvement Acts out of the general county rate, it is not possible to make any actual transfer of the surplus under the Housing Act so as to reduce or clear off the deficiency under Improvement Acts."

### COLLEGE FOR NORTH STAFFORDSHIRE.

The treasurer and secretary of the Council for the Extension of Higher Education in the Potteries (Messrs. W. M. Philips and A. W. Brown) have prepared a report on the probable initial cost of building and maintaining a college in North Staffordshire. The report states that the municipal divisions of the Potteries have compelled each town to make provision on its own account, and each technical institute erected has its own staff and works independently of the others. The joint reporters were of opinion that the proposed college should, in the first instance, aim at supplementing the work of the institutes by giving instruction in those directions in which they were unable to make any provision. The directions in which development seemed to be demanded were connected with the pottery and mining industries, with the training of pupil teachers, and with the consolidation and advancement of University extension work. Their estimates of the cost of building and maintaining a college, embracing in the first instance these departments alone, were—(a) Buildings—Department of mines, 4,000*l.*; school of pottery, 4,000*l.*; training department, 6,000*l.*; general offices and

lecture-rooms (according to work undertaken), 3,000*l.* to 7,000*l.*; fitting and furnishing, 3,000*l.* to 4,000*l.*; total, 20,000*l.* to 25,000*l.* The possible income from various sources was—North Staffordshire Mining Institute, 4,000*l.*; training authority, 6,000*l.*; grants from the County Council, 3,500*l.* to 4,750*l.*; voluntary subscriptions, 6,750*l.* to 10,250*l.*; total, 20,000*l.* to 25,000*l.* (b) Cost of maintenance—Initial salaries of staff:—Principal, 500*l.*; lecturers in chemistry, ceramics, mining, physics, mathematics and languages, ranging from 400*l.* to 200*l.*; lectures in geology, 50*l.*—2,250*l.* This staff consisted only of those who were necessary to supplement existing teaching in the district, and in the event of rapid growth of the college further expenditure would be necessary. If a training department for teachers, apart from a pupil-teachers' centre, was established, an additional 950*l.* for salaries would be required, but the cost of this department would be maintained out of the Government grants, supplemented by those of the local authority. The maintenance expenses, laboratories, rates, taxes, lighting, heating, &c., would be 790*l.*, and the cost of office and organisation would be 326*l.* The approximate cost of the maintenance of the college would therefore be 3,500*l.* a year. The income from fees, grants, &c., was estimated at 1,200*l.*, leaving to be raised by grants from the local authorities and from other sources the annual sum of 2,300*l.* It was hoped that the school of pottery, in addition to training men, would act as a central advisory and analytical department for the manufacturers.

### REPAYMENT OF LOANS FOR BUILDING.

The report of the Select Committee on Repayment of Loans by Local Authorities has the following observations on rehousing:—

The contention of local authorities is that they must rehouse a large proportion of those whom they displace upon sites in the very part of their district in which land is most valuable; that if they are to rehouse the actual people whom they dispossess they cannot charge them rents higher than those which they have been accustomed to pay for their slum dwellings; that they have reduced to the lowest figure, consistent with substantial and sanitary construction, the cost of building; that they are working at a loss and that they are consequently confronted with the alternative of either making good that loss

annually out of the rates or reducing their sinking fund payments by obtaining an extension of the periods for replacement; that, in other words, they are compelled to ask for a contribution in aid of their rehousing schemes, either from the present ratepayers or from more remote future generations. The witnesses who have appeared on behalf of municipal authorities have expressed a preference for the latter alternative, and they have urged in justification of that preference that future generations will receive from their schemes both a valuable tangible asset and incalculable intangible benefits in the improved health and morals of the people.

The committee do not wish to express any opinion as to the economical character of municipal building operations, but they think that the manner in which the profit and loss account of rehousing schemes is in many places presented is calculated to convey a wrong impression as to the annual charge upon the rates arising from these schemes. Interest and sinking-fund payments on the whole amount given for the insanitary area or buildings, or expended upon demolition, are often charged against the rehousing scheme. It appears to the committee that the capital charges against the rehousing part of a scheme under Parts I. or II. of the Act should be only interest and sinking-fund charges in respect of that part of the total loan raised which is rightly attributable to the cost of building the houses and to the housing value of their sites, *i.e.* the price which such sites would fetch in the market if sold, subject to a covenant to build upon them workmen's dwellings. The rest of the loan should be regarded as expended on a sanitary improvement and repaid in a period not exceeding 60 years.

Another point in the profit and loss account which is very material in the consideration of the question whether relief should be given in respect of sinking fund charges is the scale of rents charged for the new tenements. It is obvious that if the rents charged are unreasonably low there will be a loss upon the scheme, even if repayment of loans is altogether dispensed with. Assuming it to be necessary to charge less than a commercial rent for their new accommodation in the case of those who have actually been compulsorily displaced, and have not received compensation under the provisions for that purpose, the committee consider that in all other cases the rent should be such as is commanded by similar accommodation in the district. To adopt any other scale must lead to great difficulty in selecting the tenants of these exceptionally low-rented tenements, and to a serious reduction of the supply of houses by private enterprise.

The committee further suggest that the amount allowed in these accounts for repairs and renewals should not be based upon the probable cost of repairs during the earlier years of the currency of the loan when the houses are new, but upon the probable average annual cost during the whole period.

A period for repayment which would, in the opinion of the committee, be just both to the present and the future, could be arrived at in the case of that portion of each loan which is required strictly for rehousing, if the points dealt with in paragraphs 65, 66 and 67 were attended to in submitting to the sanctioning authority estimates as to the probable financial results of the scheme. They recommend that estimates so framed should in every case be required and examined, and that the period assigned for the repayment of that portion of the loan should be subject to an absolute maximum of eighty years.

#### *Housing under Part III.*

It has been represented to the committee that local authorities are placed at a disadvantage as compared with their private competitors in housing undertakings by the fact that they are compelled to repay their housing loans within the periods at present allowed.

The statutory maximum periods are sixty years in England and Ireland and thirty years in Scotland. The committee see no reason for the exceptional treatment of Scotland in this matter. It should also be observed that under the Housing of the Working Classes Act, 1890, the money advanced by the Public Works Loans Commissioners to building societies or individuals for housing purposes must be repaid in a period not exceeding fifty years.

In the Metropolis, if the County Council borrows for housing purposes, or if the metropolitan boroughs obtain their housing loans from that Council, the full maximum term for repayment of the whole loan is obtained. This is apparently the result of the fact that sixty years is the period assigned for redemption by the London County Council (Money) Acts which have been passed with the assent of the Treasury.

If the metropolitan boroughs were to borrow for housing from any other source than the county council they would be subject to the more stringent limitations placed on the repayment of loans formerly raised by vestries.

In England outside the Metropolis, and in Ireland, the English and Irish Local Government Boards respectively fix within the limit of sixty years the period for the repayment of

each loan raised under the general Acts dealing with the matter.

In practice these boards usually allow 60 years in the case of loans for land and 40 years for buildings.

In allowing 40 years for buildings the boards apply that term not merely to bricks and mortar and other material of long life, but also to a variety of items many of which are from the outset, or may by ordinary wear and tear speedily become short-lived; the amount of these items not infrequently equals a considerable proportion of the cost of the outer shell.

Under the annuity system the amounts required to be paid each year to extinguish a 3 per cent. loan in 40 and 60 years are equal to an annual payment of 4.33 per cent. and 3.61 per cent. respectively upon the amount of the loan. Private enterprise would hardly enter into building operations which did not show a margin of receipts over working expenses amounting to larger percentages than these upon the money invested. It appears, therefore, to the committee that municipal builders are not hampered in their competition with other builders by the present conditions of repayment under which their capital is raised.

It has, however, been urged upon the committee on behalf of the local authorities that the capital required in the case of their houses is greater than in the case of houses erected by private enterprise, because of the high standard of excellence which is enforced in regard to their building operations by public opinion and by the requirements of the public departments. Several instances in which it is alleged that such requirements were unreasonable have been brought to the notice of the committee, but it has not been proved in any case that those requirements exceeded the standard which ought to be enforced by building by-laws upon all builders, public or private.

The municipal witnesses have suggested to the committee various periods as being, in the opinion of the local authorities which they represented or of housing conferences, appropriate for the repayment of loans raised for housing undertakings.

Some of these witnesses expressed the opinion that loans for the purchase of sites for houses should not be required to be repaid at all, but that such sites should be regarded as liquid assets against the debt, because it would always be possible to resell them for the sum, or more than the sum, given for them by the local authority.

The opinion more generally expressed was that sums borrowed for such sites should be repaid within 100 years. In view of the fact already referred to that the policy of Parlia-

ment has always been to prevent the creation under general Acts of a permanent debt by local authorities, the committee think that the latter opinion is the more reasonable one, and proceed to discuss it.

It must be remarked in the first place that the extension from 60 to 100 years of the period for site loans is not one which is of very great financial importance to present ratepayers. Such sites in the case of housing, as distinct from rehousing, can be, and generally are, selected upon the outskirts of the town, and the price paid for them does not usually represent a very large proportion of the total cost of the scheme. If a 3 per cent. basis and the annuity system of repayment are adopted, it will be found that the suggested extension would only mean to present ratepayers an annual saving of 9s upon every 100l. of the sum given for the site.

On the other hand, the extension would mean to future generations a very considerable increase of the risk they are called upon to undertake, *i.e.* the risk of finding themselves, owing to migration of population or other causes, possessed of land for which, if they wish to sell it, they cannot obtain a price equal to the amount of the charges in respect of its acquisition still remaining upon it, and for which, if they retain it, they are compelled if the annuity system of repayment has been adopted, to make precisely the same annual sinking-fund payments as those which were made by their predecessors whose representatives undertook the enterprise for which the land was required and selected the site.

The committee, however, realise that this risk may be very greatly diminished by the adoption of the instalment system of repayment. Under that system a far larger portion of the capital borrowed is repaid in the earlier years of the loan period than under the annuity system; and the committee think it improbable that, even if the period for repayment of loans raised for the purchase of sites for dwelling-houses was somewhat extended, such land, if judiciously purchased, would often become during the currency of the loan worth less than the amount of the debt upon it, which, under that system, was still unpaid.

Some witnesses have represented to the committee that a distinction may be drawn between the land acquired by local authorities for the erection of dwelling-houses and that purchased for other purposes. The committee think that there is some substance in this representation. Suitable land for dwelling-houses is more likely, on account of its position, to retain its value than sites of sewage works, or lands for water

supply; it can more easily be resold than land on which a public building has been erected, or which has been thrown into a street; its resale would not provoke the same opposition as that of a public park or recreation ground; in other words, it forms a more liquid asset to meet debt than any other land purchased by local authorities.

After full consideration of all the financial and other arguments on the subject which have been placed before them, the committee are prepared to recommend that, subject to the acceptance of the instalment system of repayment, the maximum period allowed in the case of loans under Part III. of the Act of 1890 for sites for dwelling-houses should be extended to eighty years, provided that the fixing of the exact period within that maximum for each of such loans is left to be decided by the sanctioning authority after consideration of the situation of the land, the price given for it and all the circumstances of the locality.

It appears from the evidence that the statutory maximum of 60 years for the repayment of loans for building operations under Part III. would, if made applicable to the whole of the United Kingdom, meet the views of most of the witnesses who have appeared before the committee to represent the councils of extra-metropolitan cities and boroughs, but Lord Welby, speaking on behalf of the London County Council, expressed the opinion that this maximum term should be increased in the case of such loans—if raised by that Council—to 100 years.

The committee recognise that there are certain considerations with regard to the Metropolis which may justify the preferential position in which the London County Council is placed by being able to obtain in all cases sixty years for the repayment of money borrowed for housing purposes, but they consider that even in the metropolitan area, and with regard to the building operations of the London County Council, a period of sixty years, which is generally considered as equivalent to the lives of two generations, is the longest term which can properly be allowed for the repayment of loans raised for the erection of artisans' dwellings under Part III. of the Act.

The committee have next to consider whether there should be any modification of the present practice of the departments in fixing, when it is their duty to do so, the actual term for the repayment of a building loan.

The department charged with this duty should in each case take into consideration not only the question of how long the buildings which are to be erected will remain in existence as dwellings, but also the question of how long the effective

demand for dwellings of the proposed type in the proposed position will continue.

It is obvious that an answer to the first question can only be arrived at after a careful consideration of plans and specifications, and may then be rendered wholly incorrect by matters over which the Department has no control, e.g., bad workmanship or insufficient attention to periodical repair.

The answer to the second question must be an effort of prophecy, based on a knowledge of the particular locality and a study of the migrations of population which have taken place and their causes. The steady advance in the type of accommodation required by the working classes and the probable effect of improved facilities for locomotion upon the distribution of population must also be borne in mind.

Every witness who appeared before the committee to represent a particular locality was not unnaturally inclined to the opinion that the population of that locality must in future rather increase than decrease. On the other hand, the committee have received evidence of considerable decreases of population in other localities which may have arisen either from temporary or permanent causes.

In view of the infinite variety in the manner in which the questions mentioned above must be answered, in considering the application of different authorities for sanction to borrow money for different building schemes, the committee do not think that any one period for repayment can be decided upon which would be universally appropriate.

The committee are not prepared to say that the period of forty years usually allowed by the departments concerned is either too long or too short in all cases.

If the departments had the power either to insist upon the adoption of the instalment system for repayment, or to secure by audit the maintenance of adequate provision for repair, the committee would consider, in the case of these loans, that the periods usually granted are too short, but they cannot adopt that general view in the present state of the law upon the subject.

If, as the committee believe to be the case, all the circumstances of the locality are considered in deciding upon each application, and the scale of periods allowed in respect of each of the groups of items which make up the total cost of a building is periodically reviewed with due regard to the improvements introduced into building operations, the committee consider that the departments may be relied upon to do substantial justice in fixing the periods for repayment.

## THE WEEK.

IT was said by Captain WELLS, the chief officer of the Metropolitan Fire Brigade, at the inquest concerning the Queen Victoria Street fire on Monday, that if one of the firemen had known the geography of the building lives might have been saved. The words are enough to suggest the wisdom of the edict which was issued in the time of LOUIS XIV. in Paris, and by which it was ordered that all the master masons, carpenters, tilers, or roof-coverers should give their names to the commissaries of the various districts of the city in order that they might be available when their services were demanded on occasions when fire broke out. Heavy penalties were inflicted on all who attempted to evade their obligations. It was realised that those men were acquainted with the planning of the old timber houses which stood in the narrow streets of Paris, and in cases of emergency would instinctively arrive at the nooks and corners in which the terrified inmates would seek shelter. The modern firemen are mainly derived from sailors, and there is no doubt about their courage and activity; but as, from their past experience, they can know very little about the disposition of the parts of houses, they are in a difficulty when they have to combat the flames in so complicated a series of buildings as formed the theatre of the tragedy in Queen Victoria Street. Captain WELLS said he was in favour of such an amendment of the London Building Act as would insure proper structural access to all buildings, and where there is a deficiency in geographical knowledge that arrangement would be an advantage.

THE majority of the buildings throughout the country in which minor civil actions are heard and criminal cases are tried have not the qualities which impress people with a belief that much respect is given by us to justice. They are generally badly arranged, insufficiently lighted, and with ineffective ventilation. In many towns they were erected at a time when architecture appears to have been unknown. A day spent in one of the courts is enough to fatigue the strongest lawyer. The local authorities are supposed to be responsible for the buildings, but the expenses of improvements they wish to cast upon the State, while the State repudiates all liability. The decisive action taken by Judge EMDEN in regard to the Tunbridge Wells court-house on Monday may have the effect of drawing attention to a widely-felt grievance. He has come to the resolution that whenever a long and important case has to be heard he will abandon the Tunbridge Wells court in favour of the Tonbridge court, which is four or five miles distant. His Honour has endeavoured during a number of years to convince the Town Council about the necessity of building a new court-house, for, as he believes, it is absolutely impossible for justice to be administered in a room so ill adapted to suggest the majesty of law. But the magistrates have lately passed a resolution declaring that a new court-house was not required, although it was allowed that alterations were called for. Judge EMDEN maintains that alterations would only be a waste of ratepayers' money. A street runs along one side of the building; if the windows are open the noise is deafening and distracts, if they are closed the heat is unbearable. The Tunbridge Wells court-house is, however, no more than a sample of a great many others in all parts of the country.

SOME arrangements have been settled about the restoration of Portsmouth parish church. The urgent repairs of a structural kind in the chancel will be carried out at the expense of Winchester College. The floor will be left unconcreted and ready for the replacing of the pews. Whether the old plaster will be restored or not has yet to be determined, but the vicar will be content if the walls are allowed to remain as they are. It is not a matter of urgency whether the reredos should be replaced. At present as the choir vestry the tower entrance is used, and it will therefore be necessary to add a new choir vestry. The treatment of the nave does not rest with Winchester College. The general opinion is that owing to former interments the subsoil is in an unsanitary condition. The

offensive smells are, however, ascribed by some people to decaying wood. Investigation and a prompt decision are undoubtedly called for. The most difficult of all the questions is the treatment of the pews. For the sake of the children, who according to the vicar have the same rights as adults, he claims the lowering of the pews as indispensable. Moreover, the pews are uncomfortable and of an obsolete type. The free seats and side seats are, on account of the pews, found in places which do not suggest equality among worshippers. At present gas lamps are alone relied on for warming the building, and in damp weather the church is unfitted for services; there is no system of ventilation. The parishioners appear to be unanimous about heating, ventilation and lighting. But the reseating is only approved by a minority. There is a Corporation pew which is held to be sacred, and if it should be touched there is a probability that the vicar of Portsmouth will cease to be mayor's chaplain. It seems childish that such prejudices should exercise any influence in an old parish church; but in all questions of privilege English local authorities are ready to find quarrel in a straw, and to sacrifice momentous interests to their own dignity.

THE international boat race which took place this week on the river Lee has drawn several visitors to Cork. They are not likely to fail to visit the exhibition which is now open, but there are so many rival attractions they may overlook the fine art section, which is one of the most interesting of all. Owing in a large measure to the labours of Mr. ARTHUR HILL, architect, a very important collection of pictures and drawings has been secured. The English corporations, the Board of Education, the Royal Academy, the Society of Arts, and many painters and sculptors have generously lent examples, and the monetary value is very large. They are insured for nearly 70,000/. It is satisfactory to find examples by MACLISE, who was born in Cork in 1806, and whose reputation is still upheld in the city. Another native artist is ADAM BUCK, who in 1811 brought out a collection of 100 Greek vases, drawn and engraved by himself. He exhibited in the Royal Academy between 1795 and 1833. NATHANIEL GROGAN deserves to be remembered, for he published views in the neighbourhood of Cork, and depicted such scenes as *An Irish Fair* and *An Irish Wake*. The English paintings are far more numerous and of a higher class than those by Irish artists. But this is explained by recollecting the difference in the support which is obtainable by artists in the two countries. There are several models of sculpture by JOHN HOGAN, who, if not a native of Cork, went there in his tenth year, and in his early days as an artist received support from Sir THOMAS DEANE, the architect, in whose office he acted as draughtsman.

THE importance of a railway as a factor in everyday life is never fully appreciated until there is some stoppage of the traffic. The appearance of a crack in a tunnel on the South-Eastern Railway between Grove Park and Chislehurst has made it necessary to divert the trains, and it would be difficult to estimate the inconvenience which has followed. The working of the line is the subject of constant and adverse criticism, but the changes of route, which have been unavoidable and which affect a very large area, can hardly be ascribed to the present management. Settlements in buildings and other structures have become so common, it should excite no surprise that a brick tunnel which dates from 1865 requires shoring, and, it may be, reconstruction. It has been found necessary to widen the line, and a new tunnel was therefore formed parallel to the old one. The operations may have caused sufficient disturbance of the earth to account for the cracks. The prompt action of the directors has prevented a fall of brickwork that on so busy a line might have resulted in a deplorable loss of life. The tunnel is over 2,000 feet in length, and will require to be scrutinised before the traffic can be again allowed to pass through it. At present the arch is secured by means of timber lining. It may be possible to overcome the danger by a removal of the parts which have shown signs of weakness. But a brick tunnel sometimes becomes as united as a casting, and injuries to the construction are rarely confined to one part, but in a greater or less degree affect the entire work.

PAINTERS' ARCHITECTURE: CLAUDE LORRAINE.

## LIVERPOOL CATHEDRAL COMPETITION.

THE contents of the portfolios submitted by architects in the preliminary stage of this competition are on exhibition this week, and fill three of the large rooms of the Walker Art Gallery. Each set is carefully grouped, and provided with a distinguishing number. A by no means successful attempt has been made to prevent identification by pinning a card over authors' names, the presumption being that neither the committee nor the assessors shall know whose work they are examining when making their award. The precaution is, however, superfluous, as much of the work has been previously published, and is consequently well known.

MESSRS. BASIL CHAMPNEYS, AUSTIN & PALEY, W. D. CARÖE, SIR THOMAS DREW, CRAM, GOODHUE & FERGUSON, of Boston, U.S.A., and W. H. BIDLAKE, among others, are represented merely by photographs and drawings of executed work, much of which is very excellent, but in no case exceeds in importance that of a large church.

The chief interest of the exhibition is supplied by those architects who have had the courage to prepare special designs for a cathedral, and make an attempt to strike out from the beaten track of the old Gothic plan of the square tower at the crossing. In practically all of these the form adopted is the octagon. One exception, however, must be noted—a very original interior based on the hexagon.

The finish of these central features is in most cases by means of the dome, doubtless from the fear of dwarfing the other parts by the great height and bulk of a tower or spire termination. In no case, however, is the effect thoroughly happy. All bear the appearance of a fruitless struggle to give Gothic character to a shape which is evidently unsuitable, and are simply Byzantine or Renaissance domes masquerading in Gothic trimmings.

The threatened Byzantine revival is not so largely evidenced as might have been expected. There is, however, one design which deserves more than passing notice. Renaissance is but poorly represented, and the advanced school has contributed one example of weird originality which is an object lesson in what not to do.

Viewed generally, much of the work is ambitious and incompetent; but this is in a measure atoned for by other examples of more than ordinary merit, ably designed and well illustrated.

In No. 46 the main feature is a large octagonal central dome, with flanking towers on the four corners finished with spires, a central *fleche* to the dome, and two western towers also finished with spires, making seven in all, which are very similar both in treatment, size and elevation. The design thus lacks a really dominant feature, the author having evidently endeavoured to subdue the dome by carrying the corner towers above its springing line, and emphasising them at the expense of the western towers, which are brached at a lower level. One strong merit of this design is the manner in which these flanking towers act

as buttresses to the dome, and carry the central structure down to earth. Another is the provision of direct lighting at the ground level through the corner towers to the centre of the crossing, which also gives a vista terminated by a window through each arch of the octagon.

No. 84 has in plan practically the same arrangement, the similarity being very striking. The elevational treatment is, however, different; the corner towers are made subordinate to the central octagon, which has its angles strongly buttressed, with pinnacles rising above the broad of a lantern spire. This design is not sufficiently illustrated, there being only in addition to the plan one section through the nave showing external treatment of lantern and transepts.

No. 18 shows a fully-illustrated design which also has the octagonal plan for the central feature, finished in this case with a dome and flanking towers, but the towers stand free from the lantern, and consequently are not of service as buttresses. The west front is somewhat on the lines of Peterborough—with towers at either side—too far apart to form a satisfactory composition.

The west front of No. 28 is also reminiscent of this same example. The centre octagonal plan again appears. It is 82 feet in width, crossed by four arches in continuation of the lines of nave and transept arcades, which intersect and give a square in centre equal to the nave width. Upon this construction the author has had the temerity to poise a high square lantern tower, which looks distinctly dangerous.

No. 45 consists of a good set of drawings illustrating design for the "Cathedral Church of St. Paul." The centre feature is octagonal, or rather possibly a square with splayed corners. These are so short that the angles become a group of triple piers effectively treated. The church has double aisles, that adjoining the nave being very narrow, the consequence being the piers are brought very close together, two arcades separating the main aisle from the nave, where under ordinary conditions one would have sufficed. The architectural treatment is excellent, and the design throughout shows much ability. No. 45A is another study evidently from the same hand, and has the hexagon as the basis of its central arrangement, with small transepts opening from each of the double sides. This design also has much cleverness to recommend it, though the semi-vaulting of the hexagon with ribs spanning 83 feet, each of which is twice intersected in its sweep by similar ribs having a like span, and leaving an unvaulted centre hexagonal in shape and 48 feet wide, through which may be seen the lantern windows and the dome, is a doubtful piece of construction.

The lantern is topped with a dome, as are also the western towers, with the evident desire to bring them all into sympathy. The result does not convince, but rather tends to spoil an otherwise very able design.

(To be continued.)

## MODERN JOINERY.\*

AT no former time could it be said with more truth than in our days that "of the making of books there is no end." The reading of the titles of those which appear in a single week is not a slight task, and we suppose nobody but a trained librarian could remember them. Anyone who has attempted to classify the varieties of the 5,000 works which is the average annual output in this country will, however, acknowledge there is a deficiency of one kind. It is almost impossible to meet with a volume written by a genuine working man on his own trade. Many technical treatises are issued on trades and callings, but the compilers of them generally betray by their language that they have not gained the experience which is only to be derived from operations on the materials which are used in the business they describe. They may select a higher point of view than is attainable in the workshop, but on that account the writings are strange to regular operatives. This deficiency does not arise from any want of skill in expressing themselves among men who are employed in trades. Many of them can write well, but their thoughts are turned in another direction. They wish apparently to show their capability for governing nobler spirits than themselves, and to ministers and administrators *in posse* the everyday details of the workshop must be insignificant. There is, of course, an excuse for their indifference. It does not take a man long to realise that the advancement in the social scale on which high and low set their hearts is not to be gained by manual dexterity. Other qualities are found to be more advantageous. The result is that not only is there an absence of books by workmen for workmen, but in nearly all the handicrafts there is a decline of interest among those who take part in them, and men are less proud of their work than formerly.

To those who have studied this aspect of the question of labour such a volume as "Practical Joinery," by Mr. GEORGE ELLIS, will have a peculiar value, unlike that of the majority of books on construction. He is a certified carpenter, whatever that may mean, and an instructor in joinery to a training school. But what, in our eyes, is far more important in qualifying him for authorship is that he has "practised the craft in all its branches for upwards of twenty-five years." It is also satisfactory to know that he does not attempt to furnish a text-book in the narrower acceptance of the term; or, in other words, he does not profess to show a short and easy way for the attainment of certificates which are of little value, or to enable readers to teach carpentry after once going through the pages, although the author at other times offers to train candidates for examination either personally or by correspondence.

Like so many of the terms used in trades the word joinery is only partially expressive. Joining is an almost universal need, for nearly every production consists of several pieces skilfully put together. Even the sculptor cannot always make his statue out of a single block of marble or obtain his bronze figure by one casting. Skill in construction is in a measure the ability to make suitable joints. Mr. ELLIS's definition of joinery as "the art of preparing, constructing and fixing the internal and external wood fittings of a building, as distinguished from carpentry, which in like manner deals with constructive woodwork," is only explicit to those who are acquainted with the modern system of production. Engineering contractors employ men for whom fittings, which are generally taken as ornamental forms, have no importance, but in building work it is not always easy to distinguish between carpentry and joinery, and in country towns, if not in large London workshops, workmen undertake both with almost equal readiness. The difference between the two is suggested by one being paid for by the cubic foot and the other by the superficial foot, but often it means no more in a workman's eyes than the possession of tools. For joinery a more numerous assortment is demanded than for carpentry, and while one workman is proud of having wealth in a variety of tools, there are others who contrive to get through with very few aids, and those not always of the best. The use of tools is

described clearly by Mr. ELLIS; but in all operations relating to joinery the best way of acquiring skill is not by reading, but through mistakes which bring forth the sarcasm of those who are dexterous. The important subject of joints is also treated. After classifying them as glued joints, dry joints, angle joints, framing joints and shutting joints, it is necessary to add miscellaneous joints, comprising "various joints and connections in use for special purposes, and not coming under either of the above descriptions." The fact is, so many joints can be formed it is not easy to fix them all in a few divisions.

The several classes of work on which joiners are engaged are treated in succession, such as doors, gates, door framings, windows, shutters, shop fronts and fittings, airtight casework, fittings for banks, museums, libraries and churches; shaped, curved and bevelled work, stair building, hand railing, moulding. There are also chapters on timber, woods used in joinery, and a glossary of terms and phrases connected with joinery. Throughout we see indications that the author has some of the old-fashioned pride in work when properly executed. Thus kerfing is condemned as "a very crude and inferior method of obtaining a curved surface, discreditable alike to the workman's skill and his ingenuity; there is neither beauty in the curve or strength in the work." We also find Mr. ELLIS contrasting the fittings during the reigns of the last HENRYS, MARY and ELIZABETH, when the art of joinery was evolved, and the often "meaningless assemblage of hollows and rounds that do duty for mouldings in our own times, thanks mainly to the exigencies of machine production." In the chapter on foremen's duties, in which information is given about drawings and the setting out of work, we have the following remarks, which suggest some of the deficiencies which cause dissatisfaction:—

Methods of setting out vary in different shops, unfortunately, both for employer and workman, tending much to the pecuniary loss of the former and the mental distraction of the latter. In one, the "rods" will be set out loosely, sections varying and requiring "allowances" to be made by the workman; in another they will be literal copies of the "plans," no discretion being used in the translation, with the result that the various parts of the construction will not "dovetail." Implicit reliance cannot be placed on "working drawings." Errors in construction creep in sometimes in the original, and more often in the tracing, which it is the duty of the intelligent foreman to eliminate. He should be able to distinguish between what is essential, as conveyed by the whole tenor of the specification, and what is merely suggestive. It must be remembered that the architect is not versed in the constructive details; he is a designer, not a craftsman, and his drawings are made to indicate more fully and clearly than can be conveyed in the specification what it is that he requires. To determine the correct way of attaining the desired result is the duty of the foreman. Sundry deviations from given dimensions may be necessary to bring the work within marked sizes, &c., or to compensate for some authorised alteration. No definite rule can be laid down; common sense must dictate when it is necessary to apply for authority to make some alteration. A third method of setting out, and this is the one we offer as an example for the embryo foreman to copy, is to set the rod out to the "tried up" sizes of the stuff—that is, the size the material is after having been planed up—and to make some allowances for fitting and fixing, not upon the rod, but on the material. This will do away with the necessity of the workman making allowances, which is a fruitful source of error.

We do not anticipate that working joiners will undergo the sacrifice of the twelve shillings required for the purchase of Mr. ELLIS's treatise, with the exception of those who aspire to be clerks of works or foremen. The latter are allowed the privilege of a monopoly of thinking by their fellow-workmen, and may be disposed to discover the reasons which determine the production of various kinds of work. We believe the volume will be of the greatest use to students of a different class, viz. to those who have taken up architecture and quantity surveying. It is no ephemeral publication, for it has the best of claims to be called practical, and information will be found in the pages which is not obtainable in the ordinary professional books on work in wood. The glossary at the end with its workmen's terminology is one instance. In every case the author says he has relied upon his own experience, and that is a recommendation which does not customarily belong to technical treatises.

\* *Modern Practical Joinery: A Treatise on the Practice of Joiner's Work by Hand and Machine.* By George Ellis. (London: B. T. Batsford.)

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

## The Midsummer Examinations.

## Preliminary.

THE preliminary examination, qualifying for registration as Probationer R.I.B.A., was held in London and the various non-metropolitan centres indicated below on the 10th and 11th ult. Of the 207 candidates admitted, 40, having furnished satisfactory evidence of their attainments, were exempted from sitting. The remaining 167 sat for the examination, with the following results:—

	Passed.	Relegated.	Total.
London . . . . .	67	23	87
Birmingham . . . . .	8	—	8
Bristol . . . . .	9	—	9
Exeter . . . . .	5	—	5
Leeds . . . . .	15	2	17
Manchester . . . . .	24	3	27
Glasgow . . . . .	4	1	5
Newcastle . . . . .	8	1	9
	140	27	167

The passed candidates, with those exempted—numbering altogether 180—have been registered as probationers. The following are their names and addresses:—

H. E. Adams, London; D. M. Addis, Edinburgh; J. Allner, Manchester; J. E. Bailey, Bushy Heath, Herts; D. Bamford, Manchester; T. M. Banks, Darlington; R. F. Bargman, Dorking; W. J. Barnsley, Walsall; J. Baxendale, Bolton; H. A. Beeston, Dover; G. A. Bell, Leicester; O. P. Bevan, Bridgend, Glam.; W. G. Blakey, Sunderland; H. Booth, Leeds; G. P. Boyd, Berwick-on-Tweed; J. Boyd, Oldham; T. A. D'A. Braddell, London; A. V. Bramble, Emsworth, Hants; P. S. Brenton, Weston, Bath; G. B. Bridgman, London; W. J. Brough, London; E. M. Browett, Wolverhampton; E. O. Brown, Christchurch, Hants; J. C. Bucknill, B.A., London; R. G. Burrow, Manchester; J. S. Cable, London; G. J. Calder, London; H. J. Chetwood, Felsted, Essex; D. J. Chisholm, Edinburgh; C. W. ## Intermediate.

The Intermediate Examination, qualifying for registration as Student R.I.B.A., was held in London and the under-mentioned non-metropolitan centres on the 10th, 11th, 12th and 13th ult. Ninety-eight candidates were examined, with the following results:—

	Passed.	Relegated.	Total.
London . . . . .	36	34	70
Bristol . . . . .	6	2	8
Glasgow . . . . .	1	2	3
Leeds . . . . .	6	3	9
Manchester . . . . .	1	4	5
Newcastle . . . . .	1	2	3
	51	47	98

The passed candidates, who have been registered as students, are as follows, the names being given in order of merit as placed by the Board of Examiners:—

H. J. Ash, Willenhall, Staffordshire; A. C. Bosson, London; R. E. Stewardson, London; J. L. Fouracre, Plymouth; H. J. C. Marshall, London; G. A. Farrar, Huddersfield; F. G. Johnson, Risca, Newport; J. E. Braithwaite, Leeds; E. G. Allen, London; A. F. Benjamin, London; D. Mitchell, London; W. A. Hodges, London; F. W. Hayward, Minehead, Somerset; J. W. Walker, Aberdeen, N.B.; S. C. Ramsey, Sutton, Surrey; W. E. Watson, London; Miss B. Potts, Banbury; P. J. Westwood, Grays, Essex; N. Culley, Huddersfield; C. L. Gill, London; T. T. Sawday, Leicester; A. R. Powys, Somerset; W. T. Loveday, Banbury; F. Thorpe, Oldham; H. MacG. Bowes, London; R. W. Yates, Huddersfield; A. E. Brooker, London; H. F. Murrell, London; E. G. W. Souster, Northampton; L. M. Gotch, Kettering; E. E. B. Claypole, London; J. I. Tweedie, Annan, N.B.; W. W. Robinson, jun., Hereford; E. G. G. Bax, London; M. S. Briggs, Otley; W. A. T. Carter, London; H. E. Clifford, Watford, Herts; R. S. Dacombe, Southampton; W. R. Davison, Woldingham; G. T. Forrest, Wakefield; E. L. Haynes, St. Albans; A. R. Holman, Penarth; R. Huggup, jun., Glanton, R.S.O., Northumberland; N. T. Myers, Watford; P. C. Pilling, London; T. E. Richards, Barry; F. J. Robinson, Upper Weston, Bath; E. W. Slaughter, Windsor; H. R. G. S. Smallman, London; F. A. Sprules, Sutton, Surrey; F. G. Stockdale, London.

## Final and Special.

The final and special examinations, qualifying for candidature as Associate R.I.B.A., were held in London from the 11th to the 18th inst. Of the 73 candidates examined 46 passed. The successful candidates are as follows:—

G. W. Allsop, C. W. Beaumont, J. H. Belfrage, R. Berrill, W. Bevan, H. C. Bishop, E. D. Brown, R. P. Chamberlain, H. Chapman, jun., A. R. Conder, E. F. M. Elms, R. F. Farrar, J. H. Gibbons, T. H. Gibbs, T. S. Gregson, B. Greig, P. J. Groom, P. J. Haywood, W. H. Hobday, O. Holden, A. L. Holder, H. S. Jardine, I. M. Kent, R. G. Kirkby, H. Moger, W. J. Nash, C. F. Newcombe, P. C. Newman, W. C. Oman, E. O. Payne, W. S. Payne, R. McM. Roberts, A. R. Robertson, J. M. Ross, E. Simm, S. Smith, J. Swarbrick, G. Walker, C. F. Ward, L. F. Ward, C. W. F. Wheeler, T. W. Whipp, H. A. Wilson, R. G. Wilson, jun., D. Wood, W. Wrigley.

The number of failures in each subject of the final examination was as follows:—

I. Design . . . . .	23
II. Mouldings and ornament . . . . .	18
III. Building materials . . . . .	16
IV. Principles of hygiene . . . . .	10
V. Specifications . . . . .	8
VI. Construction, foundations, &c. . . . .	15
VII. Construction, iron and steel, &c. . . . .	16

## THE LATE MR. J. J. TALBOT.

THE very sudden and unexpected death of Mr. J. J. Talbot, of Liverpool, which occurred on the 20th of last month, removes from the ranks of architecture one of the names most prominently associated with the large scheme of employes' dwellings in connection with the works of Messrs. Lever Bros., Ltd., at Port Sunlight, Cheshire. Mr. Talbot, who was a native of Bolton, was born in August 1871, and was therefore still a young man. Shortly after starting business he entered into partnership with Mr. W. G. Wilson, and the work was carried on under the names of Wilson & Talbot, Commerce Court, Lord Street, Liverpool. Amongst the works carried out by the firm are many of the blocks of cottages referred to at Port Sunlight and the New Ferry Liberal Club on the same estate. A large portion of Mr. Talbot's business, however, consisted of domestic work of a more important character, including a number of private houses in the neighbourhood of Birkenhead. At the time of his death Mr. Talbot was engaged on extensive additions to Thornton Manor, Thornton Hough, Cheshire, for Mr. W. H. Lever, where he had practically a free hand. Amongst these additions a magnificent music-room and extensive stables were just approaching completion. A drawing in the present exhibition at the Royal Academy illustrates the Unitarian church, Birkenhead, at present in course of erection. He was a regular and successful exhibitor at the Academy. His architectural work was characterised by a very thorough and painstaking attention to every detail.

## VENTILATION OF THE HOUSE OF COMMONS.

EVIDENCE was given last week by Mr. Dick Peddie, architect, Edinburgh, before the select committee on the ventilation of the House of Commons. He said that he had made an examination of the existing arrangements, and had arrived at the conclusion that the ideal method would be to draw in the fresh air from above instead of from below, as at present. To supply sufficient ventilation for a full House it would be necessary under the present system to introduce air in such volume through the floor as to be uncomfortable to members; whilst, on the other hand, if the air were introduced from above, and extracted from below, there would be no discomfort to members, and better results would be obtained. At the same time, he did not think it would be wise to make any startling innovation upon the existing arrangements. There were certain defects which he thought could be easily remedied. For instance, he thought it would be possible to make the existing arrangements more certain and effective in their operation. In his opinion the air introduced into the chamber should be treated by means of steam pipes, and the existing fans should be altered.

## THE DESIGNS FOR THE LIVERPOOL CATHEDRAL.

THE effect on the lay mind of the drawings submitted in the preliminary competition for the Liverpool Cathedral can be judged from the following extract from the *Liverpool Courier*:-

The drawings exhibit great variety of style and merit. They are not all of ecclesiastical buildings, and only a comparatively small number of the competitors have made special designs for the St James's Mount fane. Whatever order of architecture the committee may prefer, there will be no difficulty in finding it on the walls, and they are offered equal latitude in the matter of cost. One apparently transatlantic designer will help us to the most stupendous cathedral in the world at the cost of a few millions. Others, who have their fingers on the pulse of Liverpool plutocrats, will provide at a more modest figure something neat and tasteful in the semblance of a Methodist meeting-house. As to style, you may have anything from bridecake Gothic to that which apes the affected primitiveness of Morris furniture. The peculiar uglinesses of modern American design are painfully apparent not only in elevations that have crossed the ocean but in British drawings—even our architects are being Americanised, of which Liverpool already has some portentous examples to show. There is nothing in our midst, as yet, however, to equal that remarkable design which an architect of enterprise has neatly inserted in the background of an enlarged photograph of St. James's Cemetery—a sprawling, shapeless shape which would be quite at home as a Saurian tabernacle in one of Mr. E. T. Reed's "Prehistoric Peeps." From the prospect of such an edifice the visitor turns with quite a new feeling of toleration to the mechanical prettinesses

of conventional Gothic or the Italianised platitudes of gentlemen who want to be classical, but either can't get Sir Christopher Wren out of their heads, or, if they do, provoke a lively sentiment of regret at their success.

If regarded merely as artistic productions, the drawings will be found to exhibit a pleasing diversity of technique, ranging from slight memoranda by architects who feel confident that their ideas need no elaborate embellishment to recommend them, to laborious sets of drawings in pen and ink or colour, which must have involved much thought and labour. Here and there one encounters a design treated pictorially. One tyro has washed his drawings down until they have quite an Impressionistic ghostliness; and another competitor, with a neat dramatic effectiveness, has introduced an approving ray of roseate light descending diagonally from heaven upon the roof of his hallowed pile.

The list of competing architects, as already stated, is long, but one fails to find in it several names without which no short list of our best ecclesiastical architects is complete. Perhaps this is the explanation of the undoubted fact that the feeling of a visitor after a first inspection of the exhibition is one of vague disappointment. Doubtless there are some clever designs, even a few that are exceptionally ingenious and effective, but the good things are thinly sprinkled among the many mediocre, even as the well-known and highly-esteemed names in the list are to be found here and there in a numerous company of the less distinguished. It is comforting to remember that the committee reserved to itself the right to invite gentlemen other than those who have joined the preliminary competition to send in plans in that which is to ensue. The committee has done its duty to obscure British architectural genius by giving any member of the profession an opportunity of entering the lists. It must now turn its attention to the far more important duty of securing for its constituents competitive plans by the best men of the day, thus insuring to the second city of the empire an ecclesiastical centre to which posterity may point with pleasure and pride as a monument of the wisdom and greatness of Liverpool in the beginning of the twentieth century.

The following is the official list of names of architects who have sent in portfolios of drawings in the preliminary competition. Their addresses the committee have resolved to withhold for the present:—

R. A. Briggs  
Rene Buyck  
Fred. H. Dudley  
E. Goldie  
J. Dale  
Albert C. Capronnier  
A. W. Crook  
Geo. Simmonds  
Geo. Taylor  
F. R. Kempson  
Hippolyte J. Blanc  
De Mathelin  
Basil Champneys  
W. J. Medcalf  
John Bloore, jun.  
R. W. Collier  
Austin & Paley  
W. D. Caröe  
W. J. H. Leverton  
A. Greothaert  
F. Billerey  
A. Colpoys Wood  
Sir Thomas Drew  
J. Brooks, Son & Godsell  
Robert W. Gibson  
J. Robertson  
Walter le Riele  
E. Dobbeleers  
C. H. Mileham  
F. M. Simpson  
Alph. Gosset  
— Grayson  
C. Demaeght  
G. P. D. Saul  
J. Oldrid Scott  
C. A. Nicholson  
H. A. Prothero  
W. H. Jewitt  
J. Coates Carter  
E. A. Heffer  
A. H. Skipworth  
F. H. & J. Sparrow

A. D. Sharp  
H. Wilson  
Reilly & Peach  
W. F. Tapper  
Goodwin S. Packer  
J. Atwood Slater

### THE DEVON AND EXETER ARCHITECTURAL SOCIETY.

ON Saturday last, July 19, the Devon and Exeter Architectural Society paid a visit to Truro as the guests of Mr. Silvanus Trevail, F.R.I.B.A. Their host met them at the station, where refreshments were duly provided at 9.30 A.M. Then a tour was made of the city. A careful inspection was made of the very interesting work now being carried out by Messrs. Relf & Son, of Plymouth, at the east of Truro station. The Victoria Gardens were visited on the way to the new municipal cattle market, and then on to Kenwyn Church, where the party was met by Archdeacon Cornish. From this point the best view is obtainable of Truro and its new cathedral. Among many other places of interest which were duly visited, mention may be made of the Royal Institution of Cornwall, the free library and county technical schools, St. Mary's Wesleyan chapel and schools, and finally the works of the cathedral, where Mr. Price, the clerk of works, kindly acted as guide. Several of the party ventured to the top of the central tower, which has reached a height of about 150 feet. The walls have nearly reached the stage at which the spire will begin, but there is yet another 100 feet of work to be done before the highest point is attained. From the topmost scaffolding a very fine view of the city is to be obtained. Chancellor Worledge acted as guide within the sacred building, where the beautiful plate, the reredos, baptistery and other parts, together with the fine stained glass, were observed with close interest. The municipal, bank and other buildings were glanced at on the way to Mr. Trevail's house in Lemon Street, where luncheon was provided by the generosity of the host. Later the company embarked on the steamboat, the *Queen of the Fal*, for a trip to Falmouth, where, despite the rain, several places of interest were visited, returning later to their host's house at Truro for a parting cup of tea before leaving the city, after a memorable day's outing and a Cornish welcome.

### THE CHISLEHURST TUNNELS.

ON Tuesday Sir Benjamin Baker made a thorough inspection of the Chislehurst tunnels and has reported to the directors of the South-Eastern and Chatham Railway. In the case of the old tunnel, for a comparatively short length there was, he found, some flaking off of the brickwork at the side of the wall nearest the new tunnel and at the crown of the arch. The new tunnel at the same spot also showed some slight signs of abnormal pressure, as there were a few vertical cracks in the side wall nearest the old tunnel, and the drainage culvert was somewhat distorted. The cause of the damage in both cases was the compressible nature of the soil intervening between the two tunnels at this particular spot; the old tunnel had stood nearly forty years without any signs of failure. The remedy in both cases was, he thought, the same, namely, to invert certain lengths of both tunnels, so as to distribute the weight over the foundations and prevent side walls from moving forward. This was a simple and comparatively inexpensive work, and had often been done before in the case of many other railway tunnels under similar circumstances. It could be executed far more expeditiously and economically if the tunnels were handed over to the contractors free from traffic, and at the same time all risk of accident to trains from portions of brickwork flaking off and falling on the rails would be avoided. Sir Benjamin Baker strongly advised, therefore, that the traffic should be diverted, not merely until the damaged brickwork of the side walls and arch was restored, but until the new inverts were completed. This course would not only be safer, but involve, in his opinion, less public inconvenience in the long run. The directors will act upon the advice of Sir Benjamin Baker, and regret that some inconvenience will be caused to passengers on the main line portion of the South-Eastern section below Grove Park, but every effort will be made to minimise it as far as possible.

### OUNDLÉ, NORTHAMPTONSHIRE.

THIS picturesque Northamptonshire town, as yet unspoilt by the busy commercialism which defaces so many of its neighbours higher up the Nene Valley, forms a most convenient centre for an architectural holiday in the fertile district by which it is surrounded. Its own attractions to the student are neither few nor small, the quiet stone-built streets abounding in quaint and interesting "bits." One of the most striking features in the market square is the very pleasing Renaissance building (an ironmonger's shop), which appears in two of the sketches on centre plate. This telling design is produced by very simple means, and entirely with local material. The columns of the open loggia and other stone dressings are of Ketton stone, the mass of the walling being of Welldon stone

in very thin courses, and the roof covered with Collyweston stone slates. Wood bressummers support the upper storey, and the simple modillion cornice is also of wood. Several other buildings of similar style and almost equal interest may be seen in other parts of the town.

The church of St. Peter contains many interesting features, and work of all periods from Early Pointed to Perpendicular, presenting in particular excellent facilities for the study of the evolution of window tracery, of the growth of which almost the complete sequence may be traced. The plan is very complex, in effect, the transepts being very fully developed. An ancient wooden pulpit, bearing abundant traces of colour and gilding, and a brass eagle lectern rescued from the bed of the river deserve careful scrutiny.

Externally the whole effect is dominated by the immense tower and spire soaring into the air upwards of 300 feet. The tower, considerably later in date than the rest of the church fabric, was apparently built as an independent structure—detached by some few feet from the west end of the nave—a wise precaution in view of the considerable settlement likely to occur at first, owing to its concentrated and heavy loading of the foundations. At some subsequent date (though probably carrying out the original intention) a lofty arch was formed in its eastern face and the nave walls extended against its

OUNDLÉ CHURCH  
WEST DOOR.

S. NORTH.

buttresses, thus throwing its lower storey open to the church. The spire bears the date 1634 inscribed on a stone at its base—probably that of its rebuilding or reparation after one of those mishaps from lightning or tempest so frequently recorded in the history of these lofty landmarks. The form of the open crockets is peculiar, resembling somewhat the handle of an earthenware jug. A characteristic local treatment, of which this is perhaps the earliest and most successfully managed example, is the cluster of castellated turrets taking the place of the more ordinary pinnacles masking the transition from square to octagon plan at the junction of tower and spire. Kettering and All Saints, Stamford, show a similar motive.

Of the old inns of Oundle much might be written—their number is prodigious. The Talbot has been frequently illustrated, but for picturesque effect must yield the palm to the White Lion, opposite the east end of the church. The fine trees of the graveyard lend much of the effect to this charming group.

## NOTES AND COMMENTS.

THE difference between the principles adopted in valuing buildings is never more markedly displayed than in cases relating to assessment for rates, for on those occasions more liberty is allowed to witnesses. This week an appeal was heard at the Portsmouth Quarter Sessions which at first sight might appear to be simple, and not to allow of much controversy. It related to a building in Southsea which is used as a branch by the National Provincial Bank, Ltd. The site cost 2,550*l.*, and the expenditure on the building was 10,556*l.*, or, in all, 13,100*l.* Recently the premises were assessed at 500*l.* gross and 425*l.* rateable value. An objection was raised by the banking company, and notice was given of appeal, whereupon the gross value was reduced to 400*l.*, and the rateable to 340*l.* One witness estimated the value of site and building at 11,500*l.*, and assuming 4½ per cent. to be a fair return, the gross value would therefore be 517*l.* 10*s.* and the rateable 471*l.* 10*s.* Another witness put down the gross value at 612*l.* A third witness said if the bank were to be let he would regard 360*l.* as a fair rent; the gross value he estimated at 345*l.*, and the net rateable value at 293*l.* 5*s.* The last witness put down the values at 350*l.* gross and 297*l.* 10*s.* net. It is not surprising that with amounts which were so much at variance, Mr. WARRY, K.C., the Recorder, who heard the appeal, should decline to give a decision until the next sessions.

THE "building of a railway" is supposed to be an Americanism. In England it was usually understood to be more correct to say the construction of a railway, the verb to construct being applied to works on an extensive scale, while to build was restricted to houses and other structures having a roof. The American invasion has broken through the boundaries of language. Last week the Master of the Rolls declared that the word build was not confined to bricks and mortar, but was certainly applicable to a railway embankment. When we recollect how vast is the difference between shaping and laying stones or bricks, preparing woodwork and the numerous skilful operations which are required in a house, and, on the other hand, the simple operation of forming an embankment by the tilting of numerous truckloads of earth, we must say language has lost its precision when we find work so unlike designated by one term. Certainly it was to be expected that the Court of Appeal would refrain from sanctioning so much laxity in the use of words. The case under consideration was novel and interesting. The Long Eaton Recreation Grounds Company, Ltd., purchased an estate which they wished to utilise partly for sports and partly for building purposes. All the plots were sold under certain conditions. One was that no fence wall more than 2 feet high, with suitable iron palisades, was to be set up, and that only private dwelling-houses were to be erected. Some of the plots were resold to the Midland Railway Company, who therefore adopted the restrictive covenants. But instead of houses an embankment was raised, and instead of a 2-foot fence wall they formed a post and rail fence. The plaintiffs claimed compensation and were awarded 650*l.*, which was confirmed by Mr. Justice LAWRENCE. The railway company appealed, and contended that the covenant against the raising of any buildings but dwelling-houses did not apply, as there was a distinction between a building and an erection. The word "erection" was much more comprehensive than "building," and included such a thing as an embankment, whereas an embankment was not a building. The Court of Appeal, as we have said, adopted another interpretation of the word "build," and the appeal of the railway company was accordingly dismissed.

A LIGHT has been thrown upon the economical or rather commissariat arrangements adopted in ancient Greece whenever public buildings had to be constructed on an exceptional scale. In the town of Kyzikos, on one of the islands in the Sea of Marmora, there lived in the time of the Emperor CALIGULA an influential princess who was the mother of three kings. ANTONIA TRYPHAINA resolved to restore some of the chief structures in Kyzikos and to make improvements in the harbour. Whenever there is a

demand for labour it is always forthcoming, and workmen came from all quarters attracted by the possibility of receiving high wages. But as happens at the present moment in South Africa, where the wages seem to be unusually liberal because nothing is mentioned about the enormous increase in the price of food and shelter, so in Kyzikos there seemed to be a likelihood that the workmen on learning the true state of affairs would depart and leave the unfinished works as a warning to those who came after them. An inscription has been found which reveals the measures which were adopted for the regulation of the difficulty. It was ordered that the authorities of the town should fix the prices for goods in the market, and that no dealer was to vary them on any account. A rise of prices was to be dealt with as an offence against the common weal. Every citizen who disobeyed was to lose all rights, and strangers who changed their prices were to be cast out of the city. The stalls of offenders were to be closed until the building operations were completed, and on each of them a proclamation was to be affixed announcing the cause of their suspension. Theoretical economists who know little of the suffering which is produced by unexpected rises in the cost of food, may condemn the arrangements as barbarous, but a great many building workmen and navvies engaged on English contracts will testify that it would often be an advantage if a similar protection was afforded them in our times.

No more than five gold medals, or about one-half the usual number, have been awarded this year in the National Competition of Schools of Art. There are, it must be understood, no competitors from the Royal College of Art, and other prominent schools are unrepresented. But there is no doubt the judges have become more rigorous. The medallists belong to the Battersea, Birmingham, Liverpool, New Cross and Sheffield schools. Consolation may be derived in the 85 silver medals, 297 bronze medals and 739 book prizes. The "art nouveau" does not find favour with the examiners, and its influence on some of the students is regretted. The style, or rather fashion, is admired by many, and it ought to be considered whether students should not show themselves competent to meet the needs of the time. If a manufacturer thinks there is a demand, although only a temporary one, for the latest mode, it can hardly be expected that any of his designers would resist his directions, and in that way rise in revolt against their employer. A question of artistic ethics is connected with the subject, and it ought to be conceded that students in the schools should be able to deal with the requirements of the day. The authorities have, however, always a tendency to neglect the present for the sake of the past, and, owing to the manner in which prizes are bestowed on the decision of judges who are not infallible or indifferent in their own lives to what fashion exacts, a character of obsolescence is imparted to the schools, which no energy on the part of the masters can remove.

It is believed that the Louvre contains about 42,000 original drawings; they are not all, of course, by great masters. Several among them are not of higher quality than those which may be met with in dealers' portfolios. The collection is not sufficiently known to the public, and it has therefore been proposed to compile a catalogue of the most remarkable drawings of each school. But to bring out a work in a style suitable to the drawings would be very costly, and would not serve the purpose of the authorities, being restricted in its sale on account of the costliness. Meanwhile, it has been resolved to attach notices corresponding with those usually found in a catalogue to the drawings which are exhibited, and which will be changed from time to time. Every amateur is not able to realise the subjects of many drawings, nor to understand what relation they may hold to famous pictures. The information given will, therefore, be acceptable to many.

HARROGATE TOWN HALL.

CATHEDRAL SERIES—HEREFORD: NAVE ARCHES, NORTH SIDE.

#### HEREFORD CATHEDRAL IN 1786.

ONE of the early water-colour artists in this country was Thomas Hearne. He with Cozens, Paul and Thomas Sandby, and Taverner should be looked upon as the pioneers of the art. Hearne was born at Brinkworth, near Malmesbury, in 1744. He went to London early in life, where he was granted a premium at the Society of Arts in 1763, was apprenticed to William Woollett, the engraver, in 1765, and continued with him some six years. At the end of that time he accompanied Lord Lavington, who had been appointed Governor of the Leeward Islands, and for three years and a half was employed in making drawings of the landscapes, forts and harbours of the islands. He abandoned engraving, and devoted himself to drawings of topography, for which he was well adapted. In 1777 he began an extensive tour in England and Scotland, in preparation for a large work he afterwards brought out, in conjunction with William Byrne, called "The Antiquities of Great Britain." The drawings for the work, fifty-two in number, were exhibited at the Spring Gardens Rooms. They were the product of nearly four years' work. He contributed between 1780 and 1802 twenty-four drawings of landscape and old buildings to the Royal Academy exhibitions.

Hearne's works, though restricted in colour, are harmonious and sunny; his drawing is true and elegant, showing direct

observation of nature, and by these qualities, combined with a fine sense of composition, he greatly advanced the art of landscape-painting in water-colour, and had a strong influence upon Girtin and Turner, who copied his drawings at Dr. Monro's and Mr. Henderson's. He used the pen in order to define outlines, but less obtrusively than other artists of the time, and his architectural representations become more effective in consequence.

In 1786 Hearne visited Hereford. The fall of the western tower and a part of the nave occurred on Easter Monday of that year. He was therefore able to give a representation of the ruined building before the whole of the old masonry had been removed. From Hearne's general accuracy it may be taken for granted that he gives an exact view of the appearance of the nave, and by contrasting the above reproduction of the engraving made from the drawing for John Britton with the larger view we publish this week, one of James Wyatt's innovations will be manifest. All the parts above the lower Norman arches must be debited to Wyatt, and, moreover, in his restoration he destroyed the interior effect of the building by shortening the nave to the extent of one bay. If it were not for Hearne's drawing there might be doubts about the extent of Wyatt's tampering, which falsified the architectural history of the cathedral.

#### WHY THE CAMPANILE COLLAPSED.

A CORRESPONDENT of the *Scotsman*, Mr. A. Robertson, writing from Venice on July 15, the day after the collapse, says:—

This morning, in the company of the engineers who have charge of Venice monuments, I have been all over the sad pyramid of ruins that marks the spot where but twenty-four hours ago the noble Campanile of St. Mark's raised its proud head high into the air, over which, as it were, hung the great gold angel glittering in dazzling brightness in the rays of the early sun. A landmark, a seamark, to which thousands and tens of thousands turned their eyes as they threw open their shutters to the light and the breeze of the morning. I say "where it stood." For it did not fall. It shrank into itself. It collapsed like a pack of cards. The Campanile is not. It has gone, disappeared for ever. A Campanile will rise again, but not the Campanile we knew. That has gone for ever. And what is there? One of the saddest ruin heaps I have ever

seen. It is a pyramid 50 or 60 feet high, and over a thousand feet in circumference. They have covered the sculptured base of one of the three great standard poles of the Republic. They have surrounded the first open porch of St. Mark's Church that rests on slender marble shafts, but they have not touched it. In front of that porch stood a short thick column of red porphyry, the column of "il bando," as it is called, of banishment, of exile. A huge piece of marble adhering to a mass of brickwork, with an iron bar run through it, was hurled, as if shot from a cannon, against that column. The shock made it leap clean out of the ground, but it saved the church. The huge block of marble and brick and iron was stopped 10 inches from the marble shaft. Other pieces, meeting no resistance, were hurled against the basement wall of the baptistery, doing but little harm. Inside the porch the angle of the main body of the church is buried in debris, but probably little harm is done. All about lie broken columns, bits of carving, pieces of hewn stone, huge twisted sheets of copper roofing (for the green sloping roof of the loggia

on the top of the Campanile was copper); iron bars bent and broken, and shattered, splintered marbles everywhere—gleaming, too, here and there, all over the heap were pieces of the broken bronze bells that, hung high up in the loggia, had called the senators to the council hall, the workmen to the arsenal and the people to prayer, down the centuries, from generation to generation. Their tongues now for ever silent. One of the five bells, a small one, seemed unbroken. It lay buried in the debris near the top of the heap, with the entire rim of its mouth exposed. I think it is the one that was named "Preghiera," that called morning and evening the Venetians to their prayers.

And now about the why of the collapse of this colossal Campanile.

1. Though the walls were thick, for they were only a few inches under 6 feet, they were really not solid. They consisted of two parallel walls of brick, the space (3 feet wide) between them being filled up with broken bricks, rubble, cement, stones, &c. Therefore the walls were not so strong as they looked.

2. The cement used was Istrian lime mixed with sea sand. This lime does not become hard, nor does it adhere well to the bricks. Indeed, in the course of the past centuries it became dry powder. It is all over Venice to-day. It formed the cloud that hid the falling Campanile.

3. It had been damaged by lightning, by fire and earthquake several times. On June 7, 1398, it was struck by lightning. In 1401, on the occasion of festivities for the Doge Michael Steno, fires were lighted on the platform, and the top was burned. On October 24, 1403, the same thing happened. In 1405 the same thing happened. In 1417 it was struck by lightning, and the new top of wood again burned. On June 21, 1436, all the shops round the Campanile built against it were burned. On March 26, 1511, an earthquake split its four corners. In June 1548 it was struck by lightning. In 1565 it was struck by lightning. On July 10, 1591, an earthquake caused it to shake from top to bottom. In 1653 again struck by lightning. On August 23, 1657, again struck by lightning. On April 23, 1745, again struck by lightning, which damaged its east side severely, killing many people in the Campanile and near it. This was its last and most serious damage, although it was not till June 18, 1776, that the Republic employed the scientist Guiseppe Toaldo to put up a lightning conductor.

4. The Republic, seeing its east side to be severely damaged, consulted two engineers of fame and ability, Signor Zandrini, of Venice, and Signor Polene, of Padua, to examine and repair it. These engineers said the whole wall wanted support, and they proposed building a new wall against the old one. This was done. But the new wall was never properly tied to the old one. The two were practically separate, and so the weight of the Campanile was borne unequally and its equilibrium disturbed?

5. The ringing of the bells, the firing of artillery, and only three weeks ago the simultaneous firing in the Piazza of hundreds of muskets had a tendency to disturb it. Also the more or less frequent earthquakes that visit Venice.

6. Twenty years ago one of the corner pilasters of the inner wall, and precisely that at the north-east corner, was seen to be cracked in many places. The authorities of St. Mark's Church, who have charge of the Campanile, as it is the bell-tower, had this plaster tied up. No more cracks appearing anywhere, the Campanile was thought perfectly safe and was let alone.

7. And now comes the critical point. The Loggia, little marble hall built by Sansovino, rests against the eastern wall of the Campanile. It had almost a flat roof. To prevent the rain beating against the Campanile and running down its side from entering this marble hall, a row of slabs of stone sloping downwards was inserted in the Campanile where the roof met it.

8. Only last week, that is, but ten days ago, these stones were begun to be removed, as the rain was somehow getting into the Loggia, and a lead sheeting was to have been substituted. Instead of carefully removing one stone at a time, they removed half of them, that is, 25 feet of them. Not only so, but they dug through the new wall of the Campanile, that of 1745, and struck the old original wall, which they found separate from the new, and full of holes and cracks. Whilst working, the old wall slipped down an inch or two. Instantly the cut made was built up, but it was too late. On Wednesday it was observed that the new wall was cracked at the north-east corner, above the Loggia, where the work was begun. On Thursday it enlarged. On Friday it struck across the north side of the Campanile, sloping upward to the second window from the ground, then up to the third. On Saturday it passed behind the fourth and through the fifth. On Sunday the situation was, to use the word of an engineer, "desperate," and the Campanile was doomed. On Monday the crack visibly opened whilst we watched it, and the end came in a moment, when the whole structure sank into itself.

Now for the responsibility. Who was responsible?

First, the engineer of the Campanile is Signor Saccardo,

who is the engineer of St. Mark's Church. But Signor Saccardo is not the engineer in charge of the "marble hall," the Loggia of Sansovino. That is under the charge of the authorities who take care of other national monuments in Venice. Secondly, these authorities in repairing the Loggia roof, for which they were responsible, cut into the Campanile, as we have seen, as one might cut into a tree they intended to fell, and this they did without consulting Signor Saccardo, who bears the care of the Campanile.

The cutting, had the Campanile been in good condition, would have had no effect upon it, but as things were it was the last straw that broke the camel's back.

To-day the Minister of Public Works, Signor Nasi, accompanied by Signor Calderini and Signor Boito, have arrived from Rome, and an inquest will be held.

Meantime I have but two observations to make. First, knowing the perilous condition of the Campanile, was it right to allow travellers to ascend it as recently as Saturday night? Many, many, climbed its gradient steep on Saturday, the last ever to do it. Was it right to allow thousands of Venetians and strangers to promenade under its shadow on Sunday? It was only on Sunday night the band was ordered to stop playing. On Monday morning, ten minutes before its fall, we ourselves were round and round examining and touching it. Secondly, there are too many masters in Italy. The idea of two monuments, built against each other, like the Campanile and the Loggia, being under different authorities, who work independently of each other. In Venice, indeed, there are five different sources of authority in regard to such monuments, namely, the authorities of St. Mark's, the authorities for the care of monuments, the Belle Arti authorities, those who have charge of public works and the Committee of Vigilance. Then there is a seventh, the artists, who often make their voices heard in favour of not disturbing the old worn time-eaten face of things, and who sometimes hinder external renovation.

The Campanile weighed, it is calculated, 22,000 tons. That is the mass of debris, the pyramid of material, to be sorted and cleared before rebuilding can be begun. Subscriptions are being taken up for that purpose, and 500,000 francs has been already received or promised (20,000*l.*); but of this another time.

A correspondent of the *New York Herald* in Venice telegraphs:—The immediate causes of the tower's fall were the cutting of a fireplace and chimney inside, to enable the custodian to have a fire, and the cutting of a trench along the east wall, above the roof of the Loggia Sansovino to remove the rain-beaten stones and put in zinc. Signor Rupolo, the official engineer in charge of the work, cut the trench on Monday, July 7. He perceived the danger and gave the alarm; but nothing was done until Thursday, and the public was assured there was no cause for alarm.

Signor Luigi Vendrasco, the architect, was the only man who realised that the Campanile was in danger twelve years ago, when he wired to the Government expressing his fears. A special commission then appointed reported that there was no danger and Signor Vendrasco was officially reproved. In 1892 Signor Vendrasco again wired to the Government that the Campanile was in danger. Again the commission reported that it was not in danger. Signor Vendrasco was cashiered four weeks ago, when he once more reported that the tower was falling. On Monday Signor Vendrasco examined the tower at five o'clock in the morning. He then said, "It will fall in a few hours." Nobody believed him, and the broken-hearted old man left Venice the same morning.

I have had an interview with Signor Antonio Vendrasco, the son of the famous architect, Signor Luigi Vendrasco. Signor Nasi, the Minister of Public Works, telegraphed to the latter, summoning him to Venice, but he refused, replying:—"The Campanile is destroyed. I cannot save it now. You want me to bear witness so as to fix the responsibility on this person or that. I will not do so." Signor Antonio Vendrasco said to me:—"The Campanile, like an old man, needed tender handling. My father knew its condition and protested in 1892—and often since, up to Monday, July 7—that it could be saved by rebuilding the four angles in rotation, a small piece of each at a time. My father took me to the tower last Sunday and showed me the crack. I remarked, 'The walls are 5 feet thick and that crack is not dangerous.' My father replied, 'But see the cause. A cut 35 centimetres deep has been made right across the east side. The Campanile has listed eastward. It is doomed. It is like an old oak tree—felled.'"

Signor Rupolo, the young architect of public monuments, confesses that when he had finished the cut the Campanile listed and cracked. He inserted staves and wooden wedges but without avail. Signor Vendrasco would have put in copper wedges, but probably nothing would have saved the Campanile after the fatal cut was made, which was the immediate cause of its fall. The estimated cost of rebuilding the tower without renewing the foundations will be three million lire. If the

foundations are renewed an additional million will be required. One million lire has already been subscribed.

A *Herald* correspondent has asked the opinions of some of the most famous Paris architects respecting the collapse. The opinion, almost unanimous, of these gentlemen was that the disaster was inevitable, and that it would cost too much to reconstruct the edifice; at any rate, the reconstruction would be much more costly than their American colleagues seem to suppose. With one exception none of them ventured to form an estimate, even approximate, of the cost, and the exception mentioned a figure far higher than the estimates formed in New York.

M. Corroyer said:—"The question you put to me is almost impossible to discuss. Those who talk of 6,000,000 francs for such an enterprise form an absolutely fanciful estimate. It would be impossible to form an estimate at all without a previous study. In any case, the figure appears to me altogether inadequate. What I must say in the most positive terms is that I fail to understand how it is that the misfortune was not averted. That measures of preservation were not taken in time is to me wholly inexplicable. But since the catastrophe has happened, I consider it would be best to give up such a risky enterprise as to reconstruct the tower."

M. Jourdain said:—"It is materially impossible to attempt to make even an approximate valuation of the cost of reconstructing the Campanile. In spite of the ten centuries which have passed over its head, it is impossible to understand the collapse, or at any rate the neglect which must have been its cause. Such an event could not have occurred without previous warnings. There must, therefore, have been most deplorable indifference. But, in spite of my desire to satisfy the *Herald* by giving my opinion on the probable cost of the new Campanile, it is absolutely impossible for me to do so. Nothing is simpler for a writer to name, offhand, a sum which commits him to nothing, but an architect cannot do such a thing. I expect that all my colleagues will tell you the same thing, and I agree with those who hold that it is better now that the tower is destroyed not to reconstruct it."

M. Sanson said:—"It is extremely difficult to appreciate such subjects from a distance. In any case a previous study would be necessary. With the aid of good contractors the thing might be done in a few years, but one must be well backed up, especially in such an enterprise, where nothing must be left to chance. I think the thing would be risky, and though I have succeeded hitherto in keeping within the limits of my estimates, it has been due to the aid given me by my collaborators. Personally, while I deplore the destruction of the tower, without being able to understand how it could have been allowed to happen—for such an edifice does not tumble down like a house built with cards, and these accidents always occur after long warning—I consider that since it has disappeared it would be best not to rebuild it. I am very doubtful in regard to reconstruction. Viollet-le-Duc, who was no novice, seems to me to have failed in all his reconstructions, well treated though they may have been. Mind, I do not criticise his manner of treatment; no one could have succeeded better than he did. But, generally speaking, such reconstructions convey a false impression. Such an impression I have always felt at the Château de Pierrefonds, and before the mantelpiece in the Salle des Princes. It does not produce the effect of the mantelpiece of a feudal castle to my mind."

Mr. Stanford White, of the firm of Messrs. McKim, Mead & White, New York, said:—

"From all I can gather from the printed despatches the fall was due to the weakening of the foundations of the structure. The tower itself was in perfect condition. I know it well, and am certain there was no structural weakness. It was built of good materials, covered inside, and the base was considerably larger than the top. That its fall was due to the weakening of the foundations is shown by the fact that the structure tilted over from the base, and that a crack appeared before the fall, showing that there was an unequal distribution of the weight of the Campanile. The brickwork held together till the tower actually began to fall. I think there must have been a giving way of the piles on which the tower was built. Once the foundation, which consisted of piles, began to give way there was little chance of the building standing. Had the foundations been of solid masonry they might have settled to some extent and thrown the building out of the perpendicular, as is the case with the leaning tower of Pisa. Yet the structure would have stood until the top got beyond the line of the centre of gravity. Stone foundations would have been strong enough to resist this leaning tendency. In the case of piles driven into the mud, however, the conditions are entirely different. The weight of the building, once the piles begin giving way at one corner, tends to make the timbers slant outwards. The building leans in the opposite direction and the result is the fall of the structure. The cost of building a good foundation for a new structure would be great. Labour in Italy is considerably cheaper than here. Materials also cost less. I should think the rebuilding of the Campanile would cost at least 500,000 dols."

## WAREHOUSE BUILDINGS.

THE fire brigade committee of the London County Council have presented a report in which approval is given to the opinions of the chief officer which were expressed at the inquiry into the causes of the Barbican fire. Captain Wells said that the state of affairs in many parts of the City to-day as regards the conditions under which stock was kept and dealt with was considerably different from what it was a few years ago. Owing to the narrowness of many of the thoroughfares buildings were arranged in very large floor spaces so as to insure the greatest amount of light being obtained. Doorways were constructed in party walls, and lifts were now more generally provided, but cross walls and protective facial work, the factors in construction which mainly operated in delaying the spread of fire, were practically non-existent. Without advocating shutter appliances, which experience led him to regard somewhat in a questionable light, he suggested that improvements could be made at a comparatively small cost by the use of protected glass, by dispensing with wood on the exposed sides of buildings, and by more attention being paid to the construction of roofs, and, in connection with the risk to life, to the provision of alternative means of escape from buildings. The jury deprecated the use of match-boarding for walls and ceilings. That view was, the committee said, shared by all who had had experience in connection with fires in buildings in which the material was used. The law, however, would have to be altered before the suggested prohibition could be enforced. They understood that the Building Act committee would in due course report to the Council on that point and many others in connection with the proposed further amendment of the London Building Act. At the meeting of the Council on Tuesday the Building Act committee submitted a report containing revised regulations as to the provision of means of escape from fire at factories and workshops. The most important alteration in the requirements was that means of escape should be provided on the ground as well as the upper floors.

## ARCHÆOLOGY IN WILTSHIRE.

THE annual report of the Wiltshire Archæological Society refers to the value and use and good work of the Society, which were being year by year more generally recognised, not only in the county but by important authorities outside of it. Numbers XCVI. and XCVII. of the magazine had been issued. The former was a remarkable contribution to bibliographical work, for which they were greatly indebted to Mr. W. Jerome Harrison, F.G.S. It was the result of many years' study and labour, and recorded all books relating to Stonehenge and Avebury, the two great rude monuments which make Wiltshire famous. The editor of the magazine had, as in former years, received important help from Mr. G. E. Dartnell, in the shape of notes or articles, illustrations, &c., in papers and magazines dealing on Wiltshire matters, and for the lists of Wiltshire books, articles, &c. It would be a great assistance if members in other parts of the county would call his attention to any locally published pamphlets, illustrations or books, many of which without such help must necessarily escape notice. The collections which the Society was gradually acquiring had been visited and revisited more than once by gentlemen whose opinions freely expressed were of recognised value. The most notable gift to the museum during the year had been a considerable collection of flint implements from Knowle Farm, Savernake Forest, presented by Mr. S. B. Dixon, of Pewsey. This had been the most remarkable archæological discovery made in the county for many years. Great interest had been aroused by the peculiar condition of the flints, which in some respects, such as the polish seen on some of them, was most remarkable, and had not yet been satisfactorily accounted for. To the library had been added a large new scrap-book filled with prints and drawings which had recently accumulated. The Society's set of "Archæologia" had been completed nearly up to date by the kind gift of seven parts by Mr. Howard Bell, and the Rev. W. Butt gave a book of MS. notes on Stonehenge, in addition to many other books given by the Rev. Canon Wordsworth and others. The past year had been a notable one in the county from an archæological point of view. Prominent, of course, amongst other work had been the excavation around the leaning stone at Stonehenge, and in the re-erection of it in its original upright position. There could be no doubt but that that would go far to save it from rapid decay and destruction in the position it previously held. The result of the excavations so skilfully made by Mr. Gowland (a vice-president of the Society of Antiquaries), and of the very important astronomical observations made by Sir Norman Lockyer and Mr. Penrose, have gone a long way towards setting at rest the speculations of earlier days as to the date of the great stone monument. The Society has every reason to congratulate Sir Edmund Antrobus on the success of

his efforts to preserve the stones on the lines of the recommendations of the joint advisory committee. Without effective enclosure it would have been quite impossible for the investigations referred to to have been carried out. The great stones at Avebury require careful watching, warnings having been received from time to time that they were not free from risks of injury. The recommendations made by the Society last year as to the Reeves Tomb at Edington, and the remains of the carved reredos, had been attended to. The Rev. J. Sylvester Davies had been steadily working at the transcription of the Tropenell Cartulary placed at the disposal of the Society by the present owner, Mr. H. Bell, and he now reported that more than one-third of the laborious work was done. In the even more laborious work of the copy of churchyard inscriptions, Mr. T. H. Baker continued unwearily in South Wilts, and the Rev. E. Dorling had promised to do the heraldry of at least a portion of the churches in that part of the county. The Rev. G. B. Toppin continued his aid in transcribing Mr. Baker's manuscript. A barrow at Erlestoke, on which a note appeared in the magazine, was opened under Mr. B. H. Cunningham's superintendence. During the restoration of Lydiard Tregoze Church by Mr. Ponting a series of interesting frescoes was discovered, of which it was hoped an account might appear in a future magazine. The most important step taken by the Society during the past year had been the purchase of the house and garden adjoining the county museum at Devizes. This will enable the Society to extend the buildings and to obtain space for exhibiting much that was now difficult to display. It was not proposed to incur any further cost this year, but it was to be hoped that the result of a special appeal to the county next year on the occasion of the jubilee meeting will be a building fund sufficient in amount to warrant a commencement of the contemplated alterations and additions. Thanks were due to the vendors for granting a conveyance of the property free of cost.

#### THE SULTAN OF MOROCCO'S PALACE.

THE Sultan, says a correspondent of the *Times* at Fez, on account of the draining of some marshes near his palace, has decided to move into another palace in a more healthy situation. This latter building was in course of erection at the time of the death of the late Sultan Mulai el Hassan, and was never completed; but His Majesty has given orders that it is to be ready for his reception in three days' time. Every available workman in Fez has been commandeered for the completion of the building, and the arsenal is working day and night. A short time ago I accompanied His Majesty on a visit to the new palace. It consists of a courtyard some 200 yards long and 100 yards wide, paved with marble and mosaic tiles, with a sunk garden in the centre. At either end of the courtyard are arcades, on to which open the usual large high rooms of Moorish palaces, gaily decorated with painted ceilings and tile dados and floors. A number of fountains of marble add a pleasing effect to the gardens and arcades. There is no doubt that the situation is more healthy than that of the much larger palace in which His Majesty has been residing.

#### THE SIZE OF BOARD SCHOOLS.

THE school accommodation committee of the London School Board have presented a report upon the subject of the proposed limitation of the size of schools. The Board of Education wrote in March last informing the School Board that they had been giving careful attention to the general principles which should regulate the size of schools and the size and number of departments which they should contain both in London and in the country; and that they were of opinion that a school should not, as a rule, contain more than 1,000, arranged in three departments of 300 boys, 300 girls and 400 infants, or 300 senior mixed, 300 junior mixed and 400 infants; and that only under exceptional circumstances could a school with three departments and a total of 1,200 be sanctioned, though, with an additional junior mixed department, a larger total might sometimes be accepted. They added that as the Board of Education would bear these principles in mind when considering all plans for new schools and enlargements of existing schools, the retention of sites in the schedule would not necessarily commit the Board of Education to the approval of any proposals which the School Board might submit hereafter with regard to them. Some correspondence with the Department had taken place, and the committee now proposed that the Board should send a memorial to the President of the Board of Education upon the subject. In the course of the memorial it was stated:—"The London School Board fully recognise the advantages of smaller schools, especially where the circumstances of the children make the moral influence of the teacher even more important than his intel-

lectual influence. On the other hand, several of the largest of their schools are also among the most successful, as is attested by the Board of Education, and so far as they are aware, a majority of those interested in education are in favour of large schools. In Scotland and America, to take two instances, one of them under the control of the President of the Board of Education, the tendency is apparently to increase the size of the school under the one head, and to accentuate the importance of skill in organisation rather than the personal influence of the headmaster. The London School Board therefore urge that no hard and fast rule should be set up, but that different managers should be left free, as at present, to try different schemes in different circumstances. In most of the schools which the London School Board are now building it is impossible to vary the proposed size without ruining the plan or very gravely increasing the cost; and even in the case of future schools the cost of small schools will be considerably greater. But in making proposals for future accommodation the London School Board, while hoping to modify the views now laid down on behalf of the Board of Education, will of course conform to their final instructions."

#### THE PROGRESS OF BRISTOL.\*

IT may be interesting to note the changes that have taken place in this ancient city since the last visit of the Association at an annual meeting in 1877. Twenty years after that date, an important extension of the city boundaries was sanctioned by Parliament other smaller extensions having been granted in 1895 and 1901, so that the area of the city has increased from 4,687 acres in 1877, to 11,607 acres at the present time. At your last meeting the population was estimated at about 203,000; it is now estimated at 334,632. The rateable value was then 772,623*l.*; it is now 1,596,213*l.*

The success of the city is largely bound up with the docks. Mr. Ashmead's paper, read in 1877, described the works executed in the early part of the nineteenth century by a private company, but subsequently acquired by the Corporation, the policy of this action being shown by the fact that the tonnage of foreign imports increased at once nearly fourfold under the civic management. The increased size of vessels after the introduction of steam as a propelling power intensified the dangers of the navigation of the narrow and tortuous river Avon, and docks were constructed by private enterprise on both sides of the mouth of the river where it joins the estuary of the Severn. These docks were also acquired by the city. For a number of years a series of fierce battles was fought over rival schemes for dock extension or for converting the river Avon into an elongated floating dock by placing a dam across its mouth; but last year a Bill was obtained which sanctioned an expenditure of something like two millions sterling on dock extension at Avonmouth. The work has been auspiciously commenced this year by the visit of the Prince and Princess of Wales to cut the first sod. The intended works will be described by the docks engineer, Mr. W. W. Squire, M.Inst.C.E., when the members of the Association inspect the docks at Avonmouth on the 12th inst., and will therefore not be further alluded to here.

One effect of this rather prolonged discussion on the nature and situation of the extension of the docks has been to leave the sewers question very much in the condition in which it was in 1877. When the members of this Association last held their annual meeting in Bristol in that year, the late chief and valued colleague of the writer described at some length the system of sewers that had been constructed by his advice up to that date. In 1899 the writer, in conjunction with the late lamented Mr. W. Santo Crimp, prepared a scheme for dealing with the sewage not only of Bristol, but of the Avon Valley as far as Bath, by a discharge into the Severn; but docks were occupying the people's minds, and it has been aptly said that an Englishman can think of one thing only at a time. So it was that the popular vote was against the scheme, which will have to be revived, in probably a somewhat altered form to meet altered circumstances, before a very distant date.

The narrow, crooked streets of Bristol have truly been a byword and a reproach, but these were failings that it possessed in common with all Mediæval cities. The Corporation has kept steadily improving and widening such streets as the nature and amount of traffic required, and since your last visit in 1877 has spent nearly 1,000,000*l.* in these works, including the construction of bridges across the river, and in addition to about 200,000*l.* expended in minor improvements in setting back projections.

It was probably due to the possession of the magnificent recreation-grounds known as "The Downs" on the north-west of the city, having an area of 442 acres, which were made over

\* A paper read by Mr. T. H. Yabbicom, city engineer, at the annual meeting of the Incorporated Association of Municipal and County Engineers.

to the city before 1877, that the want of people's parks was not earlier felt; but as the population increased eastwards and southwards it became necessary to give the inhabitants of those parts spaces in which they could enjoy fresh air and amusements without going a considerable distance. The first of these public recreation-grounds was commenced in 1882, and since that date thirteen others have been added, varying in size from a quarter of an acre to 70 acres, most of them situated in the very congested districts. The total area of the public parks and open spaces is now 678 acres.

Since 1877 the baths committee have built or acquired six establishments, each having swimming baths, and is now constructing another in the east end of the city that will be provided with some of the most modern appliances that experience has shown to be necessary for the health and cleanliness of the people, including swimming, slipper and spray baths. The contracts for the builders and engineers' works amount to upwards of 16,000*l*. An electrical committee of the Corporation was constituted in 1884, who for the first few years contented themselves with marking time and watching the results of experiments made by others. In 1890 a small scheme for electric lighting was formulated and a generating station commenced at Temple Backs. The results both in street and domestic lighting were so satisfactory that the dynamo house was soon filled with machinery, and as the demand still rapidly increased, an additional and much larger site was obtained in St. Philip's Marsh and a new generating station built and equipped last year. The total capital outlay on land, building, plant, &c., to March 25 last was about 385,000*l*.; but a considerable extension of street lighting in the suburbs is to be carried out forthwith, and the electrical committee already find their new premises inadequate.

Until the year 1892 the hospital accommodation for diseases of an infectious character was totally inadequate and of the rudest character, but in that year the Council purchased a site of 13 acres at the extreme southern end, about 2½ miles from the centre of the city, at Novers Hill, intending to use it for both fever and smallpox patients, but the Local Government Board at once refused their sanction to smallpox being treated with other diseases simultaneously at the same site. It was therefore decided to use the Novers site for smallpox, and the Ham Green estate having come into the possession of the city in 1894, it was resolved to devote about 38 acres of it to the purposes of a fever hospital. The Local Government Board has sanctioned this mode of extension after much negotiation and the submission of many plans. The increase in the number of beds for patients will require a corresponding increase in the number of nurses and servants, and extra provision will be made for them by extending a wing from the back of the administration building. A high-level water tower will also be put up to insure a constant supply of water at high pressure. The cost of the works already executed and of those contemplated will amount to about 97,000*l*.

A consequence of some of the numerous street improvements effected during recent years has been the demolition of a number of small houses occupied by persons of the labouring class; and one of the conditions precedent to the Local Government Board granting authority to raise the cost of street improvement by means of a loan was the construction at suitable places of dwellings to nominally house those persons who had been dispossessed. After numerous plans had been prepared and rejected on the score of cost by the committee and as not being sufficiently palatial by the Local Government Board, a mean was struck to which the Board assented. The principle had been previously tried in Birmingham, and consisted in constructing the dwellings in blocks, those on the ground floor being quite separate from those on the first floor, the latter being approached from the street by a flight of stone steps leading to balconies giving access to the doors of the houses. The houses have in some cases three rooms and in others two rooms, but each is complete in itself. Some of the blocks front a public street with an open space at the back common to all the inhabitants, while others are built fronting a street laid out at right angles to the public thoroughfare. The accommodation in a three-roomed house calculated to shelter five persons consists of a living-room 14 feet by 14 feet, one bedroom 14 feet by 8 feet, and one bedroom 12 feet by 9 feet, washhouse, water-closet, sink and coal-bunker; these are let at 4*s*. 6*d* per week. The two-roomed houses, calculated to accommodate three persons, have a living-room 14 feet by 14 feet, and one bedroom 12 feet by 9 feet, with offices similar to those provided for the larger houses; these let at 3*s*. 3*d*. per week. Four blocks have already been built, containing an aggregate of 44 three-roomed houses and 26 two-roomed, sufficient to house 298 persons. A fifth block is in process of construction of six larger and four smaller houses to accommodate 42 persons. When completed the total number of persons that can be accommodated in the five blocks will be 340. The land on which the blocks are built was the property of the Corporation, and the cost of con-

struction, including roads and sewers, will amount to about 14,000*l*. The total weekly rents, if all the dwellings were occupied, would bring in 838*l*. 10*s* per annum, from which must be deducted rates and water. The blocks have been plainly built of sound red bricks, with window sills, window and door heads, steps, &c., of artificial stone made from Portland cement and destructor clinker. The floors are made of cement concrete, and woodwork has been reduced to a minimum.

The museum and valuable reference library in Queen's Road have been acquired for the city through the liberality of a former occupant of the civic chair, and recently the adjoining land has been purchased, on which is commenced the construction of a municipal art gallery to be presented to the city by Sir W. H. Wills, Bart. Handsome buildings have been erected at St. Philip's, St. George and Cheltenham Road, for free libraries and reading-rooms, and a small branch library opened at Stapleton, all fully equipped.

Bristol is much behind many smaller towns in not being provided with adequate municipal buildings to accommodate the various departments, who now have their offices in buildings scattered over different parts of the city, a system resulting in much inconvenience and loss of time. Since the increase in the number of the members of the Corporation in 1897 a new council chamber has been constructed at the back of the old offices in Corn Street, and a rates-receiving office and others built in connection with it.

Since 1892 the sanitary committee has carried out by day labour the works connected with highways and sewers, cleansing and watering the streets, and removal of house refuse. To enable these duties to be efficiently performed, dépôts were established at various places, the most important being that in St. Philip's Marsh, about 6 acres in extent, where is situate the refuse-destructor, stabling for 120 horses, with equine hospitals for accidents and infectious diseases, cart-sheds, workshops for making new and repairing old carts and waggons, engineering and carpentering shops, and an extensive factory for making artificial flagging. This dépôt was fully described by the writer in 1896, on the occasion of a district meeting of this Association, and as the paper was published and illustrated in vol. xxiii. of our "Transactions," it is not necessary to do more than refer to it.

Finally, the Corporation makes decent provision for deceased members of the community in two extensive and well-managed cemeteries. Concluding, he said although the municipality has not been idle during the last quarter of a century, yet the important undertakings of gas-making and distribution, water supply and tramways still remain in the hands of public companies. The gas company, unaffected by the competition of electric light, still pays handsome dividends; the water company provides a constant supply, unsurpassed in any town in England; while the tramways company was one of the first to adopt electric traction, and now serves every district of the city with a quick regular service in large well-appointed cars. The pluck and enterprise which have started and carried on successfully these great undertakings are to be admired; but it is a matter for regret that the financial advantages are not retained for the benefit of the citizens, but go to enrich numberless others whose only connection with the town is to receive their dividends from the commercial undertakings carried on in it.

## EFFECTS OF LIGHTNING ON "PROTECTED" BUILDINGS.

A SERIES of suggestions relating to the preparation of records of the effect of lightning on buildings which are supposed to be protected by lightning-conductors has been drawn up by Sir Oliver Lodge, F.R.S. They are intended for the guidance of observers who wish to aid the lightning research committee of the Royal Institute of British Architects and the Surveyors' Institution. The following information is considered to be desirable:—

1. Any signs or indications of where the flash appears to have first struck, and an account of the damage done.

2. A specification and drawing of the metalwork of the building, paying special attention to metal of every kind which comes anywhere in the neighbourhood of the conductor, whether roof guttering, lead covering, rain-water spouts, sewer ventilators, telephone wires, bell wires, gas pipes, ornamental railings, &c., carefully ascertaining whether any of these were either purposely or accidentally connected with the lightning-conductor, and if not, what their nearest distance was from it.

In the drawing all metals may be indicated in red, no matter of what kind they may be; the hypothetical path of the lightning, as appears to the observer most probable, may be sketched in in blue, remembering that bifurcation of path is not unlikely. Places of damage may be indicated by a blue swelling or patch, the size of the patch giving a rough idea of the relative damage, and an arrow being employed when necessary to call attention to any small patches liable to be

overlooked. The patches may be numbered, and the nature of the damage at each place stated in the description. Any place where fire broke out is to be specially attended to.

3. The nature and condition of the conductor, especially with reference to its continuity, its earth, and its elevation; also how fixed, and, if carried horizontally, its length as compared with the vertical height of its terminal above the ground; also note whether it made any sharp curves or loops round projections of the building, or took an indirect course. Cases of damage, where there have been more than one or several conductors, are specially important.

In the case of church steeples the wind vane should receive special attention, and the mode in which its rod terminates in the steeple should be ascertained.

In the case of chimneys any internal metal flue should be carefully specified. Likewise any indication that the flash took the column of hot air in preference to the conductor should be recorded; also whether the conductor was bent or curved over the mouth of the chimney or not.

In any case of importance the earth of the conductor should be specially examined, being, if possible, dug down to for this purpose, and a complete specification of the nature of the earth, the nature of the soil and of any metal ramifications as well as of moisture in its neighbourhood, should be made.

Any signs that the discharge has entered the earth should be recorded, and if the conductor is at any point damaged or otherwise affected this should be specified, and when interesting, a sample of the damaged portion should be sent. If the conductor has recently been examined and tested, or otherwise reported on, the fact should be stated.

### THE SITE FOR THE LONDON COUNTY HALL.

A REPORT has been prepared by the special committee appointed about two years ago by the London County Council to discover a suitable site for the erection of a new County Hall which should provide the necessary accommodation and be worthy of a body like the Council. The report recommends a site in the Adelphi. The task of finding a site had been very difficult, and the delay in bringing up a definite proposal had been due to anxiety to find one which, while being in a central and easily accessible position and of sufficient area, would not be unduly costly.

The site which has been selected contains an area of about 3.35 acres, and is bounded on the north by William Street, the Tivoli Music Hall and Adam Street, on the south by the Embankment Gardens, on the east by the Hotel Cecil, and on the west by York Buildings. The development could be confined to that portion of the site lying between the Embankment Gardens and John Street, and would probably necessitate (1) the widening of John Street from 38 to 50 feet, and (2) the widening of the street known as York Buildings from about 28 to 55 feet, in both cases the setting back being on the side of the road next to the buildings; (3) the closing of part of Adam Street; (4) the closing of Adelphi Terrace; and (5) the closing of Robert Street. A central entrance might be made in John Street, the principal floor being about 7 feet above the general level of that street. On this floor there would be ample and suitable space for the council-chamber, lobbies, committee-rooms, members' room and the rooms of the chairman, vice-chairman, deputy-chairman and those officers in immediate connection with the administrative work of the Council. Below the principal floor would be two floors of offices, and above the principal floor five floors of offices. The principal floor of the new offices will be kept at a uniform level throughout the buildings, as any change in its level would disturb the horizontal line of the elevation and necessitate steps in the corridor. If the principal floor is kept slightly above the Strand level throughout it would be about 30 feet above the Embankment. This would admit of a projection containing two storeys of offices, and could be so treated as to form a terrace along the entire south façade of the building and afford an important means of approach from the Embankment Gardens. The County Hall could thus be approached on the north from the Strand by way of Adam Street and John Street, and from Villiers Street by Duke Street and York Buildings and on the south from the Embankment Gardens. These buildings would provide accommodation for about 700 officials on a basis of 150 square feet of clear office space per officer. In addition the present buildings upon the portion of land lying between John Street and the northern boundary of the property could be used as offices, and would accommodate about 150 officials, thus making 850 in all. This latter property would be available for further extension of the County Hall if necessary. The valuer of the Council estimates the cost of compulsorily acquiring the freehold with possession of the whole of the properties necessary at 900,000*l.* The committee think this may appear to be a large sum, but considering the advantages of the site and its position they consider the Council would be

justified in incurring the expenditure. They add that, compared with that of other sites which have been considered, the cost would be extremely moderate, and such a favourable opportunity as now presents itself is not likely to occur again. The committee have not deemed it necessary to deal with the question of cost of erection, as that would be approximately the same whatever site was adopted.

In discussing the advantages of the site, the committee first point out that it possesses many advantages architecturally, as it will be bounded by three open sides and will be capable of simple and convenient planning. It would, moreover, have a frontage towards an assured open space under the control of the Council and opening upon the river. With regard to the extent of the river frontage, it is stated that it would be equal in length to the portion of Carlton House Terrace between the present central offices of the Council and the Duke of York's Column. As a second advantage it is pointed out that the site is a central one, easily accessible, extremely quiet, and has a north and south aspect. Objection has been made to placing the County Hall in, so to speak, a back street, and the committee think the objection is a strong one. It would not, however, apply to the present scheme. It would carry weight in the case of a purchaser other than the Council, as the frontages would then be behind the Strand; but, as the Council was able to secure adequate approaches from the Strand, and would also be able to use the important frontage openings upon the Embankment Gardens and the river, this objection is no longer valid. Thus the site is of greater utility to the Council than to any one else. There is also an important fact which bears upon this point. During recent years the School Board, the Asylums Board, the Thames Conservancy Board and the Metropolitan Police have located themselves on the Embankment. The selection of the proposed site for a County Hall would still further identify the Embankment as the recognised quarter for public buildings, while the existence of Somerset House and the Houses of Parliament on the same frontage lends an additional weight to this point. The committee add that this is the last opportunity of obtaining a central site of this dimension facing the river.

In conclusion, the committee state that they cannot too strongly urge upon the Council the need for new offices. At present the staff was scattered, and requests for additional office accommodation were continually being made, while the difficulties in meeting the demand daily increased. Too much stress could not be laid upon the serious disadvantages to the Council in continuing to rent outside premises, which could now only be obtained with great difficulty and at very high terms. Even those which could be obtained necessitated a large expenditure of money in alterations and fitting up to make them at all suitable for the Council, while the frequent changes that had to be made owing to the offices not being firmly established had caused considerable expense and inconvenience. The present condition of affairs prevented proper administration, and, in fact, it was impossible to estimate in money value the loss which was now sustained by the present inadequate and scattered office accommodation. The site they now proposed would afford sufficient area for a County Hall which would meet the requirements of the Council and be worthy of the central municipal authority of London. The report concludes with a recommendation that Parliamentary powers should be sought for the compulsory acquisition of the property necessary for the purposes of the new offices.

### SHROPSHIRE ARCHÆOLOGICAL SOCIETY.

THE annual excursion in connection with the Shropshire Archæological and Natural History Society was held on the 15th inst. The party left Shrewsbury by the 10.5 A.M. train, and on arriving at Craven Arms shortly before eleven, entered carriages and proceeded to Clundury Church, an interesting description of which was given by the vicar (the Rev. W. G. Clark-Maxwell, F.S.A.). The edifice is aisleless, of Transitional Norman architecture, dedicated to St. Swithin, and contains several interesting features, particularly a fine fifteenth-century oak roof. At noon the carriages were re-entered and the journey continued to Clun. Here the church was first visited, and its architectural features and history were very lucidly explained, in the absence of the Vicar, by the Rev. A. M. Auden. It is a large church, of the same period as Clunbury, but has been partly rebuilt. A perpendicular oak canopy at the east end of the roof is a noticeable feature. Afterwards the party inspected the ruins of the castle, and the Rev. T. Auden (chairman of the Council of the Society) gave a short and attractive outline of its history. It was formerly the stronghold of the Earls of Arundel, and apparently succeeded a fortification of much earlier date on the same site. The remains consist of a Norman keep. The ruins have recently been purchased by the Duke of Norfolk, and have, therefore, after a lapse of many years, returned to the Arundel family. Subsequently a visit was paid to the Hospital of the Holy Trinity, which was founded in 1614. At 2.30 the carriages left for

Lydbury North, passing, by kind permission of the Earl of Powis, through Walcot Park. The church at Lydbury North, which is in the course of restoration, was described by the Revs. T. Auden and A. M. Auden, who also drew attention to several interesting events in its history. The edifice is of various dates. The seventeenth-century pewing, the font and its cover, and the fittings of the Plowden chapel were much admired. Notwithstanding the excessive heat, five members walked over the hill from Clun to Lydbury North, and on the way inspected the large camp known as Bury Ditches. They joined the carriages at Lydbury North, and the whole party then proceeded to Plowden Hall, where the house and its numerous treasures—forming an art gallery and museum of great interest—were kindly shown by Mr. W. F. Plowden, who afterwards entertained his visitors to a refreshing tea, after which the party returned to Shrewsbury.

### TESSERÆ.

#### Roubiliac's Statue of Shakespeare.

THE statue of Shakespeare by Roubiliac which is in the British Museum was commissioned by David Garrick, and was first placed in his garden at Hampton. The price was fixed by the player at the parsimonious sum of 300 guineas. Garrick was eminently skilful in the art of bargain making, and persuaded the enthusiastic sculptor to undertake the work at a price which would barely cover the model and the marble. Now he who works with the consciousness that he is to be a loser seldom exerts himself like one under the double inspiration of fame and money, and Roubiliac could not but be sensible that he was to be out of pocket. Besides, the artist who carved stone under the auspices of Garrick was not likely to have much of his own will; the great player was a resolute "chipper and hewer" in dramatic compositions, and having not only represented the chief characters, but altered and recast whole pieces, of our great poet, he no doubt thought himself thoroughly qualified to dictate respecting his person. It is said that he put himself into countenance, and then into posture, and desired the astonished sculptor to model away—"for behold," said he, "the poet of Avon." This tradition is countenanced by the vanity of Garrick, and by the story related of him respecting Hogarth's portrait of Fielding. The sculptor, who had promised to carve the statue in the best marble he could afford for the price, cut it from a block hard indeed and durable, but full of faint veins, which, crossing the eyes probably or the mouth, communicated a sinister expression to the whole face. "What," exclaimed Garrick, "was Shakespeare marked with mulberries?" Roubiliac hewed the objectionable head from the shoulders, and replaced it with one of purer marble, and his patron was satisfied. From an inscription on the pedestal it appears that the statue was finished in 1758.

#### Light and Shade.

The vocabulary in use relating to light and shade is utterly inadequate to convey that knowledge of its phenomena that a painter requires. It comprises merely the terms "light," "shade," "reflection," "half-light" and "half-shade." Now all lights, with the exception of those belonging to objects self-luminous, as fire, the sun, &c., are either reflections of light from the surfaces of bodies or transmission of light from those that are transparent or partially so. The focus of light on a globe is, therefore, as much a reflection as that appearance on its shadowed side which, in ordinary language, is called the reflection, and as to the terms half-lights and half-shades, they but express, if literally understood, single degrees among the endless gradations from light to dark. It has been said that water receives no shadow, but this is either equally true of all other bodies or not true of water, which is undoubtedly subject to effects that we cannot otherwise describe than by the word shadow. When, for instance, the sun is shining on the sea, were it possible that the water could be as smooth as a mirror, we should see his disc exactly reflected, and once only, the surface of the water in other places giving an inverted image of the sky; but as such perfect stillness never occurs the light of the sun is spread on the surface by innumerable broken reflections from the waves and refractions through them, the spaces between each of these lights (as we call them) reflecting the sky, where again the upper parts of the clouds reflect the sun, and other portions of the blue sky or the sea. The blue of the sky is occasioned by still more minute reflections and refractions of the sun from and through particles of vapour more subtle than those which compose the clouds, and but for which in place of the azure there would probably be a void of utter darkness. Where clouds or other objects intercept the reflections of the sun from the waves the reflection of the sky remains, causing those patches of shadow which, seen from a low point, stripe the sea with long lines of blue. It is scarcely necessary to remark that the shadows we see distinctly on the surface of muddy water are projected on the mud within

the water, and not on the water itself, as on the face of a looking-glass very faint shadows may always be cast, but these are either on minute particles of dust or some slight degree of vapour, or on scratches invisible to the naked eye, from all of which the cleanest and most highly polished mirror is never wholly free.

#### Northern Metalwork.

Copper was a metal known to the Germanic nations before iron had been heard of, and as they were in the habit of mixing it with a little tin, the compound has received the name of bronze. It is not to be imagined that articles of bronze found in Northern Europe were imitations of Roman, &c., inasmuch as they are found just in the provinces most remote from Roman influence, Scandinavia in particular; and besides, by the time that constant traffic was established between Rome and inner Germany under Julius Cæsar the Romans had long been making their sharp instruments of iron. Gold is also frequently found at this stage of progress, but silver seems to have been a later luxury. In Northern Europe many swords, battle-axes, daggers, spears, arrow-points, shields, helmets war-trumpets (these latter very remarkable for size and execution, some having been found in mosses, fags, &c., so well preserved that they could be sounded), spurs, bits and other horse-gear, knives, saws, drinking-cups, vases, spoons, keys, &c., all of bronze, occasionally ornamented with gold. Large rings of pure gold and immense value have been found, too wide for the wrist and rather small for the neck, not to speak of their weight, which is enormous; on one side there are two excrescences which would also make them inconvenient for wear; they are supposed to be the rings used in swearing, of which mention is made in the Sagas. A man held out the ring in his hand, whereon he that was to take the oath grasped it in his. Magnificent drinking-horns of the purest gold have been met with, of which the value is incredible; they measure near a yard in length, and are most elaborately ornamented with figures of all kinds. The hair ornaments are remarkable for their size and specific gravity; there are metal crowns and helmets, in wearing which the ladies of those days must have borne some inconvenience for the sake of the fashion.

#### Imported Art.

When the Romans came and made themselves lords of Greece, they gradually learnt to admire an art that in its long since complete and perfect shape seemed to form a world by itself, that had not needed the co-operation of the moral forces for its rise and prosperity. They took possession of its products as spoils of victory and means of enjoyment, and turned contemptuously aside from the humble expressions of a plastic sense in their own countrymen and nearest neighbours. But true as it is that various ages and various peoples have to learn of each other, it must be equally true that an art imported from without, which stifles in the germ another that is trying to spring up from native dispositions, cannot wholly and entirely be set down on the side of an intellectual gain—so long as it has not been proved that this art may be transplanted from the forcing-house of higher education into common earth, acclimated, and so become part of the people's intellectual economy, as foreign grains are of its material. But that this takes place is extremely rare. Rome and Italy were stocked with Grecian works of art: markets, basilicas, temples, baths, houses boasted of such. The race grew up among them, and, nevertheless, the Romans remained at bottom, strangers to the spirit of Hellenic art. An imported art has something that wounds national feeling; the people have a dim perception that injustice has by this introduction been done to themselves and their undeveloped resources. With some the feeling becomes a suspicion that art is the foe of moral simplicity—the majority conceive her as a plaything for the rich and high born. And while it needs a subtle eye to discover her undoubtedly exalting influence, it cannot be denied that she widens the cleft between the classes, gives their education in degree and quality a difference that is not healthy.

#### Materials of Ancient Sculpture.

The sculptors of antiquity occasionally introduced a variety of materials in the same work. When various marbles were used it was called "poly lithic" sculpture, in distinction to sculpture in a simple material or stone (monolithic). In the period of the greatest glory of sculpture the union of gold with ivory was resorted to. The favourite material for works in statuary with the ancients seems to have been bronze; and we can only account for the comparatively small number of works remaining in it by the various uses to which the metal could be applied; on this account it offered great temptation to the spoiler. The mixture used was copper and tin, which is called "bronze," probably from its brown colour. The term is taken from the Italian writers. The green tint usually seen on bronze is produced by acid, either by natural oxidation or by artificial means. The mixture of bronze was much studied by the ancients. Modern sculptors have occasionally varied the

proportions of their bronze since the use of zinc has been known. It was a custom of the ancients to insert eyes in their statues of different materials from the rest of the work; usually they were of silver, but precious stones and paste have also been found. Inscriptions in silver letters were sometimes inserted in figures of bronze. Specimens of this practice exist in all collections of bronzes. Some of the ancient writers refer to tinted bronzes, and describe the effect of paleness or of blushing being produced by the peculiar commixture of the different metals. In a statue of Athamas sitting, after the murder of his son, in order to express the effect of confusion and shame a mixture of iron is said to have been used with other metals, and that the change of the ferruginous parts caused an appearance like a blush. Plutarch speaks of a statue by Silanio in which, by a peculiar mixture of metals, a paleness was spread over the countenance. Callistratus describes a statue of Cupid, by Praxiteles, which had a vivid blush on the cheeks. The combination of metals in this way appears so inconsistent with known relations that the accounts referred to must in most respects be treated as mere fancies or inventions of their authors. Colour was undoubtedly extensively used to heighten the effect. Monochromic sculpture was that in which a simple or one colour only was used.

### UNIVERSITY COLLEGE.

THE following prizes have been awarded in the Section of Architecture, by Professor T. Roger Smith:—Fine Art: Donaldson Silver Medal, C. W. Kilner, of Bury St. Edmunds.—Construction: Donaldson Silver Medal, H. W. Chapman, of London. 2nd Prize, R. M. Hilton. *Second Class*, Kuo Tung, of Pekin.—Classes maintained by the Carpenters' Company:—Measuring and Estimating: Elementary Class, Prize, C. L. McDougal, of London. *Second Class*, J. F. Willson, of London. *Third Class*, D. Bradford, of London; H. Walker, of London.—Advanced Class: Prize, R. H. Mayhew, of London. *Second Class*, J. W. Hutton, of London; S. G. Peartree, of London. *Third Class*, S. M. Deacon, of London; S. J. Durden, of London; G. L. Green, of London; W. H. Lamble, of London; B. Stapleton, of London.—Building Construction and Drawing: Elementary Class, 1st Prize, C. G. Blomfield, of London; 2nd Prize, F. T. Foxcroft, of London; 3rd Prize, W. H. Williams, of London. *Second Class*, J. T. Vivian, of London.—Advanced Class: 1st Prize, F. H. Hodson, of London; 2nd Prize, H. W. King, of London; 3rd Prize, G. Wiggins, of London. *Second Class*, L. A. Jarvis, of London; C. A. Sheppard, of London.

### GENERAL.

**The Painters** who are candidates for the membership of the Académie des Beaux-Arts, in succession to the late Benjamin-Constant, are MM. Gabriel Ferrier, François Flameng, Henri Gervex, Ferdinand Humbert, Lhermitte, Albert Maignan and Toudouze.

**The Joint Engineering Commission** appointed by the Cape Government recommends an extension of the harbour works in Table Bay at a cost of 3½ millions sterling.

**The County of Cheshire** and the city of Chester are uniting to commemorate Queen Victoria by erecting a statue to her memory in front of the Chester Castle Law Courts. Sir Horatio Lloyd informed the Cheshire Standing Joint Committee on Saturday that a sculptor had been selected and a contract had been entered into with him to execute the statue for 1,350*l*. The statue, he added, would be of bronze with a grey pedestal.

**The Prefect of the Seine**, acting on the report of M. Bouvard, the architect, has awarded prizes to the following houses as being the most worthy of those examined in 1901:—201 and 201 bis Boulevard Saint-Germain, 40 Rue Condorcet, 4 Rue de l'Abbaye, 29 Avenue Rapp, and Place des Saussaies.

**Mr. James Green**, of Messrs. Weatherall & Green, has been appointed for the fifteenth year in succession chairman of the assessment committee of the Borough of Kensington.

**The Epping Forest Committee** of the City Corporation, after paying a visit of inspection to Hainault Forest and Lambourne Common, have issued a report in which they recommend that the Court of Common Council should vote 10,000*l*. towards the purchase of the properties, which comprise over 800 acres. The Corporation will be asked to take over the management of the proposed new area.

**The Fortifications** of Thionville, in Alsace-Lorraine, consisting of eleven bastions covered by some outer works and by a fort on the right bank of the Moselle, are to be demolished.

**The Foundations** of the new buildings for the University of Birmingham were commenced last Monday. The design

for the general scheme has been prepared by Messrs. Aston Webb & E. Ingress Bell.

**The Damage** caused by the Martinique disaster is estimated by a French Government commission at 200,000,000 francs.

**The Congress** of the Iron and Steel Institute will be held during the first week of September at Düsseldorf, where an important industrial exhibition is now open.

**The Westminster City Council** are about to apply to the London County Council for sanction to borrow 92,950*l*.—of which 70,000*l*. will be repaid by the County Council on completion—for the widening of the Strand from Nos. 89 to 104, both inclusive.

**An Instruction** has been adopted by the House of Commons to the following effect:—"That it be an instruction to the committee on the Charing Cross, Euston and Hampstead Heath Railway (No. 1 and No. 3) Bill to inquire and report whether the railway proposed to be authorised by the Bill, if constructed on the lines mentioned, will not seriously injure Hampstead Heath, under which it is to pass, by tapping the wells, draining the soil, destroying the verdure and interfering with this public place of resort, and that the committee have power to call witnesses and receive evidence on the subject."

**Lord Kitchener** sold to Lord Milner all the blockhouses at 10*l*. apiece. There are 6,000, extending over a vast territory. Lord Kitchener points out that as Lord Milner has to rebuild farmhouses he cannot do better than have the timber, corrugated iron and other material ready to his hand.

**The Foundation-stone** was laid on Saturday of a new parish hall at Vickerstown. The hall is the gift of Messrs. Gradwell & Co., builders and contractors, Barrow, and will have sitting accommodation for 300 persons. The hall has been given to the parish as a gift to commemorate the accession of King Edward.

**Mr. Chevallier Taylor** is to paint a panel in the Royal Exchange which will represent the entertainment which was given by the Vintners' Company in 1356 to the five kings—Edward III., David II., John of France and the Kings of Denmark and Cyprus.

**Mr. G. E. Smith**, of Portsmouth, is the architect for the Board school to be erected in Eastney, as well as for the Portsmouth Technical Institute.

**Mr. A. E. Christie** has been appointed inspector of art schools and classes under the technical education board of the London County Council. Mr. Christie is a professional designer of furniture, upholstery, metalwork, wall-papers, &c., who has been employed as teacher of design at the Council's central school of arts and crafts.

**The Court of Common Council** having received a letter from the London County Council asking the Corporation to join them in an application to the Government to promote legislation in the next session of Parliament for regulating the breaking up by companies and others having statutory rights in the London thoroughfares, it was resolved to inform the Council that the Corporation was prepared to co-operate with them in the matter on the understanding that the Corporation retained complete and absolute control over the streets in the City.

**M. E. Fremiet's** equestrian statue of the Mediaeval warrior *Du Guesclin* was unveiled on the 20th inst. at Dinan. The work was conveyed direct from the Salon to its destination, a distance of 220 miles, by a powerful motor-car.

**A Conference** on garden cities will be held in Liverpool to-day and to-morrow under the presidency of Mr. W. H. Lever. On the latter day the delegates will visit Port Sunlight.

**The Annual General Meeting** of the British Association of Waterworks Engineers was held this week at Leicester under the presidency of Mr. Frederick Griffith.

**The Syllabus** of the day courses of instruction in architecture in connection with the Architectural Association for the session 1902-3 has been issued. The winter term commences on September 29. It states that the result of the first year's working has fully come up to the anticipation of the committee both in the number of the students and in the practical results in the work of the school.

**An Exhibition** of Japanese art was opened on Wednesday in the Whitechapel Art Gallery. It contains lacquer, carvings in wood and ivory, porcelain, bronzes, drawings and coloured prints, many of them of remarkable quality.

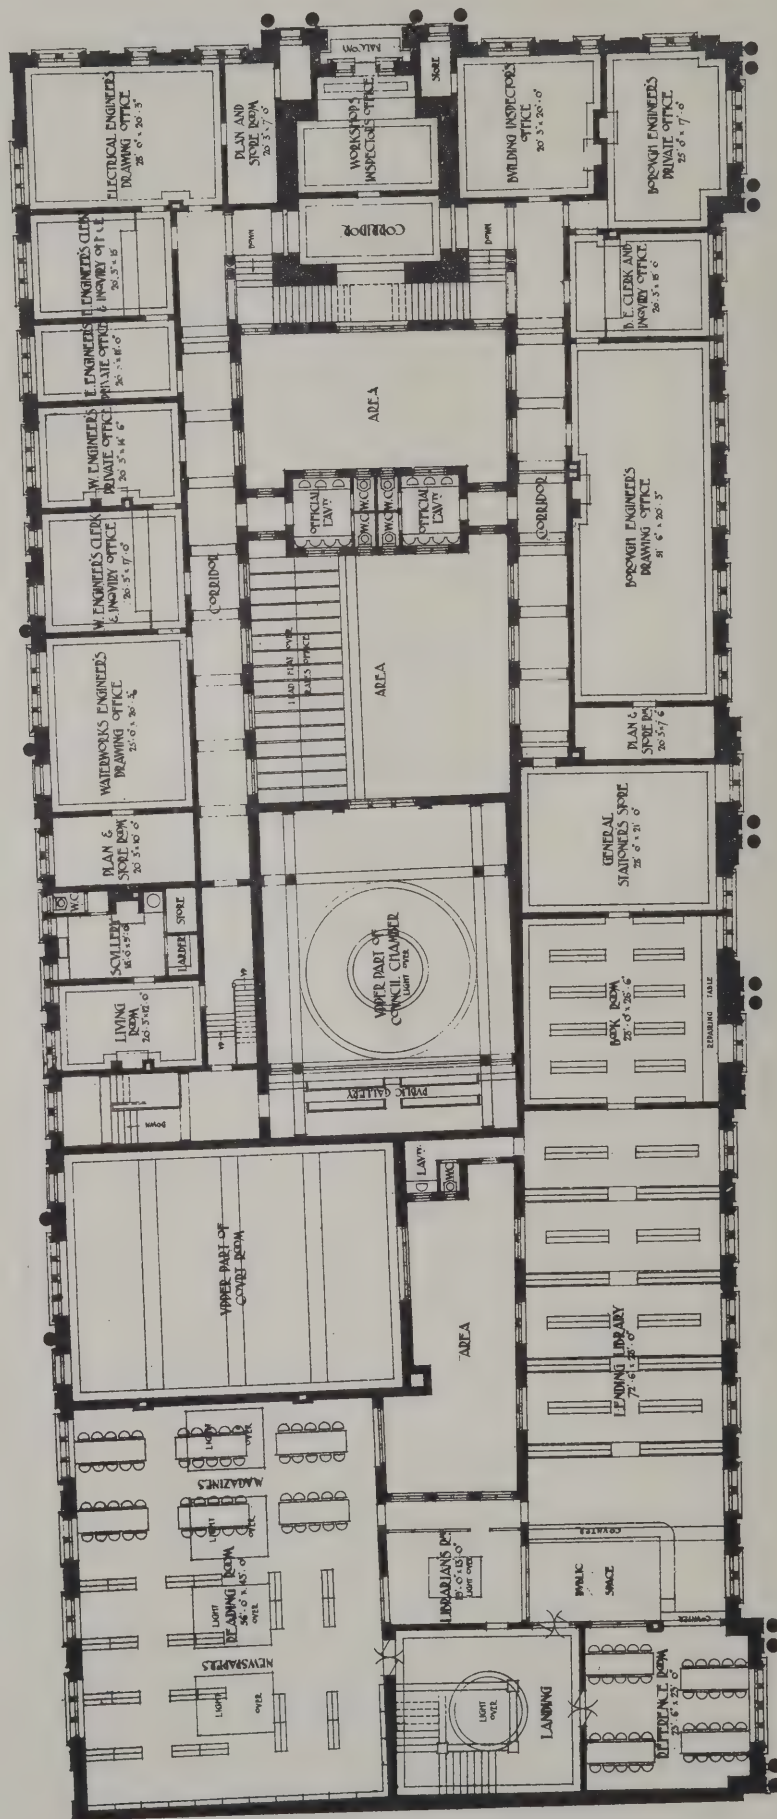

**The Executive Committee** of the Twentieth Century Fund of the Wesleyan Conference have decided to purchase the Westminster Aquarium as a site for their central Church House. The building is to be of a monumental character. It will contain a great hall capable of holding 3,000 people, and having an area of 40,000 square feet; a lesser hall to hold 1,000 people and a great library. The sum to be paid is about 330,000*l*. Any part not required for the new buildings will be resold.

THE

**Architect and Contract Reporter.****EDITORIAL NOTICES.**

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

**TENDERS, ETC.**

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

**COMPETITIONS OPEN.**

**BERMONDSEY.**—Sept. 16.—Designs are invited for artisans dwellings to be erected on land at Rotherhithe, within the borough of Bermondsey, and known as the Fulford Street area. Premiums of 100*l.*, 60*l.* and 40*l.* will be awarded. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**BIDEFORD.**—Sept. 25.—The Town Council of Bideford are about to erect municipal offices and a public library upon a site opposite the west end of the Long Bridge, Bideford, and they invite designs for the proposed buildings. Premiums of 30*l.*, 15*l.* and 10*l.* respectively are offered for the designs which shall be placed by the Council first, second and third in order of merit. Designs and descriptions, &c., are to be delivered to Mr. Wm. B. Seldon, town clerk, 18 The Quay, Bideford.

**BRISTOL.**—Designs are invited for new central library. Mr. Edmund J. Taylor, town clerk, Council House, Bristol.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford S.E.

**GRANTHAM.**—Designs are invited for the erection of a cottage home for nurses, to be erected at Grantham. A premium of 5*l.* 5*s.* will be paid for the selected design. Town Clerk, Grantham.

CABOT'S INSULATING & DEAFENING QUILT.

A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay moth, and vermin-proof, and unflammable.

FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply..	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

THE B. & S. FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

**ELECTRICAL PROGRESS IN MANCHESTER.**

LAST week several members of the electricity committee of the Manchester Corporation, under the guidance of Mr. Councillor Bowes and Mr. Councillor Hesketh, paid a visit of inspection to several of the sub-stations and some of the work at present in progress in connection with the street mains. After going through the offices, stores, testing-rooms and sub-station which are comprised in the important buildings at the Polygon, Ardwick, the party went on to sub-stations at Bennett Street and at Levenshulme, and afterwards to the sub-station at Heaton Norris, where the progress of the work was seen to be of a promising character. In deciding upon the position of a boundary wall at this place the committee exhibited a laudable desire to preserve as far as may be possible the trees in front of the building. In making note of the advance in the work of the committee it may be said that up to the end of March the cable stores and other requirements at the Polygon had amounted to 29,362*l.* There had been expended on the mains at the same date the following sums:—Manchester, 522,123*l.*; Withington, 42,220*l.*; Moss Side, 22,680*l.*; Levenshulme, 6,302*l.*; and Denton, 2,730*l.* On the 14th of the present month the total length of mains laid was only a few hundred yards short of 261 miles. It is worthy of note, too, that the quantity of electricity measured and accounted for during the past year amounted to 11,518,940 units, and that the number of consumers at present is 4,084. In order to distribute the electric energy generated at the Stuart Street works, distributing sub-stations have been arranged for in various parts of the city and surrounding districts. There will be 20 sub-stations in all, and plots of land have been purchased for this purpose amounting in the aggregate to about 25,000 square yards. These will distribute energy for the whole of the tramway services within the city area (with the exception of that portion which is within the half-mile radius of Bloom Street) as well as in the districts of Failsworth, Droylsden, Audenshaw, Gorton, Denton, Levenshulme, Heaton Norris, Moss Side and Withington. They will also distribute energy for lighting and power in the districts named, with the exception of Failsworth and Gorton, the local authorities of which have not so far transferred their lighting orders to the Corporation. For the purpose of conveying the energy from Stuart Street to the sub-stations, about 108 miles of high-pressure three-phase mains will be required, of which some 98 miles have already been laid and the remainder are now

being laid. In addition to the high-pressure feeders, considerable lengths of low-pressure traction feeders, lighting feeders and distributors are necessary. When the various sub-stations are at work supplying all the districts referred to there will be approximately 280 miles of actual mains in the ground. The total approximate cost of buildings and machinery at distributing stations and of subways for carrying mains from the Stuart Street generating station will be about 250,000*l.*

**TRADE NOTES.**

MESSRS. ARCHIBALD D. DAWNEY & SONS, LTD., engineers, of London and Cardiff, have appointed Mr. Hilliard Stephens, of 39 Victoria Street, Westminster, S.W., as their agent for the metropolitan district.

MESSRS. SWANN & HUNTER, shipbuilders, of Wallsend, are giving a clock to be fixed at the junction of four roads at Wallsend-on-Tyne. There will be a finger-post giving the name of each road, and the clock will have four illuminated dials lighted by electricity. Messrs. Wm. Potts & Sons, clock manufacturers, Newcastle-on-Tyne and Leeds, have the work well in hand.

**ELECTRIC NOTES.**

THE balance-sheet of the Coventry electric-light department for the past year shows a working profit of 2,351*l.*, as against 1,538*l.* in the previous year, but when capital charges have been covered there remains a net charge on the rates of 1,807*l.*, as against 2,250*l.* in the previous year.

CHANGES in the electricity department of the Ashton-under-Lyne Corporation, which will be the means of conferring advantages upon consumers, have been sanctioned by the Town Council. Two new engines of 250 horse-power have been installed, which will enable the department to save both in coal and water when a light load is on the system. The price of the current to private users is to be reduced from 4½*d.* to 4*d.* per unit, with an alternative contract, the terms of which require the payment of 1*s.* per quarter per 8 candle-power lamp, and 1½*d.* per unit on current consumed. The cost of the current for motive power is to be reduced from 3*d.* to 1½*d.* per unit, with special terms for users of power on a large scale.

WM. E. PECK & Co.  
8, BRADFORD AVENUE.  
LONDON, E.C.

MR. A. D. PRICE, C.E., engineering inspector, Local Government Board, held an inquiry at the town hall, Bray, Ireland, last week respecting an application for sanction to a loan of 7,000*l.* for the purpose of enlarging and rendering more efficient the electric lighting of Bray township. Mr. J. E. M'Cormick, U.D.C., chairman of the electric-lighting committee, gave evidence as to the necessity for the work in order to improve the lighting and to make the undertaking pay. The committee estimated that the revenue derivable from the electric lighting would probably be increased 50 per cent. by carrying out the proposed extensions and improvements, while practically the same staff would do the work. The commissioners had been unable to supply light to some intending consumers, and under their provisional order they were liable for this failure, and any applicant to whom they could not supply light could proceed against them. Mr. P. M'Donnell, town clerk, gave evidence as to the financial condition of the township. He stated that the valuation was annually increasing, and that the proposed loan would entail about 4*d.* in the pound additional rate, assuming that the work would be entirely unproductive; but it was calculated that the commissioners would be able to earn from 8*co.* to 1,000*l.* a year more than at present, besides having vastly improved works. The total rate in the township at present was 8*s.* 4*d.* Other evidence having been adduced, the inquiry closed with a vote of thanks to the inspector.

### BUILDING AND BUILDERS.

SKETCH-PLANS have been adopted for district baths in Leeds Road, Wakefield Road and Drummond Road, Bradford. Each, it is estimated, will cost 7,000*l.*

ON the 19th inst. Professor Mackie, of Leith, laid the foundation-stone of the church of St. Serf, Goldenacre, which is being erected along the Ferry Road, Edinburgh, and adjoining the present iron structure belonging to the congregation. Accommodation is to be provided in the new church for 800 in the area and for about 120 in the gallery. The cost, when completed, will be over 10,000*l.*

ON Tuesday the Bishop of Lichfield consecrated the new St. Peter's schools, Wolverhampton. These schools, which are situate near to St. Peter's Church institute, will take the place of the schools in St. Peter's Walk, which are about to be demolished to enlarge the wholesale market. They will

accommodate 850 children and cost 6,000*l.* The architect is Mr. F. T. Beck and the builders are Messrs. H. Willcock & Co., Wolverhampton.

THE parish of St. Martin's, Potternewton, is to have a new parochial hall and institute. The present somewhat ugly school building opposite the church, off Chapeltown Road, is to be demolished, and the new hall is to occupy the same site. It will include a suite of classrooms, as well as a large hall. Plans for the new building were invited in a limited competition, and, as a result, the design of Mr. Percy Robinson, architect, of Albion Street, Leeds, has been selected.

ON Tuesday afternoon the foundation-stone was laid of a new fire station which is to be built on a plot of long vacant land in the Blackstock Road, Finsbury Park, which was acquired for the comparatively small sum of 2,000*l.* The new building will be what is known as a full-station, which means that the equipment will include a steam fire-engine, a horsed escape, the latest appliances, stables, an officer in charge, and ten men. The cost of the building, &c., which will be carried out by the Works Department, is set down at 11,620*l.*

AT a recent meeting of the Ayr Town Council final consideration was given to the question of providing a refuse-destructor for the burgh. Estimates were submitted by Mr. Young, the town surveyor, through the medium of a sub-cleansing committee minute, showing that the site chosen was that in Mill Street, on the banks of the Ayr, adjacent to the electricity works. The estimated cost is:—Site, 3,005*l.* 1*s.* 2*d.*; buildings, 4,090*l.*; machinery and plant, 5,643*l.*; total, 12,738*l.* 1*s.* 2*d.* The site has been chosen partly with a view to the utilisation of the steam generated by the heat from the burning of the refuse at the electricity works, and the charge for this to the electricity department has in the meantime been fixed at 45*o.* per annum. The minute was adopted.

THE Wesleyan chapel committee has met for the last time before the opening of the Wesleyan Conference, and sanctioned a further outlay of between 70,000*l.* and 80,000*l.* The list contains 12 new chapels, estimated to cost 56,000*l.*; 11 cases of enlargements and alterations, estimated to cost 12,000*l.*; three new Sunday-schools, costing 2,500*l.*, besides ministers' houses and organs. One of the new Wesleyan churches to be built at Chelsea, London, is to cost 17,300*l.* At Rotherham a new church is to be built to seat 860 persons, at an estimated cost of 9,500*l.*; at Westbourne, Hartlepool, 9,350*l.* is to be expended on a new church to seat 850; in the Knaresborough circuit a

PREBEND STREET, LONDON ROAD, LEICESTER.

new church is to be built at Green Hammerton to seat 100 persons, at a cost of 750*l*. Eastmoor chapel, Wakefield, is to undergo improvements at a cost of 200*l*; also Burythorpe church in the Malton circuit. At Grimsby (South Parade) 3,500*l*. is to be spent on chapel and school enlargement. At Loftus-in-Cleveland a new Sunday-school is to be built at a cost of 1,000*l*. A considerable number of the chapel debts are to be paid off with connexional grants.

THE foundation-stone was laid on the 9th inst. at Spencer's Wood, Reading, of a new Congregational church which is in course of erection. The materials used are chiefly brick, tiles and wood, and the building will consist of a nave, with narrow aisles, chancel, vestry, tower, porch, store-room and heating chamber. The interior will be finished in red brick, with cement dado, and the roof will be supported on large oak posts on hard stone bases, the roof being open timbered. The windows will be in wood, with leaded glass, and the principal light will be obtained at the ends and by dormer windows, which will also serve for good ventilation. The tower will form a picturesque structure, and provision will be made in it for access to a small gallery to be erected at the end of the church when further accommodation is required. Absence of "style" has rather been sought than anything definitely marked, the effort being to produce something very quiet, in harmony with the country. This will be promoted by large sloping buttresses externally and a broad span of roof running over nave and aisles. The seating will consist of open benches, and accommodation will be provided for 280 adults, exclusive of future gallery, which will hold 50 persons. The church will be 63 feet in length by 31 feet in breadth. The work is being carried out from the designs and under the supervision of Messrs. Ravenscroft, Son & Morris, of Reading. The contract for the building amounts to 1,451*l*.

#### VARIETIES.

A NEW church, which will be known as St. Oswald's, at Chapel Green, Bradford, was consecrated on Saturday by the Bishop of Ripon. It will accommodate 600 persons, and has cost about 15,000*l*.

THE York City Council have resolved to advertise for a town clerk in succession to Mr. W. H. Andrew, who is appointed to St. Helens. The salary is fixed at 700*l*. yearly, the duties to be those of town clerk, clerk of the peace, clerk of

the Court of Record, and secretary and solicitor to the Ouse Navigation.

A MEETING of the trustees of the Manchester infirmary was held on Tuesday. Earl Derby presided. The following resolution was proposed:—"That the plans, estimate and report of the Board of Management now submitted to the trustees for building a Royal infirmary on the present site be approved, and that it be left in the hands of the Board to commence operations and carry out the scheme as soon as they have received a substantial sum from the public towards the cost of rebuilding." It was, however, rejected by a large majority.

THE Ochil Hills Sanatorium, Kinross-shire, was formally opened on the 16th inst. The sanatorium, which has been erected for the treatment of consumption and other forms of tuberculous disease, is about a couple of miles distant from Milnathort. It occupies a plateau on the eastern spur of the Ochil Hills, and is about 800 feet above sea level. The building has cost 35,000*l*., is constructed of blue whinstone with red sandstone facings, and forms a handsome pile. It consists of a main building of four floors, and has spacious corridors 240 feet long by 10 feet wide, designed so as to secure the maximum of sunlight and ventilation. There is bedroom accommodation for 60 patients, all the rooms facing to the south. The windows are so constructed that they can be entirely opened, thus admitting abundance of fresh air day and night. The sanatorium is equipped with the most recent appliances for the treatment of consumption. Its site is said to be one of the finest in Europe for the purpose. The county of Kinross has the smallest death-rate for pulmonary consumption of any county in Great Britain. The estate belonging to the sanatorium comprises upwards of 460 acres, within which are miles of beautifully sheltered walks of various gradients rising to 1,100 feet through pine woods.

THE Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels held its usual monthly meeting on the 17th inst., the last of the present session (to be resumed in November), at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. There were also present the Right Hon. J. G. Talbot, M.P., the Rev. A. G. Ingram, the Hon. E. P. Thesiger, C.B., Messrs. E. Lee-Warner, J. C. Powell, Lewis Wigram and the Rev. W. B. L. Hopkins, secretary. Grants of money were made in aid of the following objects, viz.:—Building new churches at Dalton-in-Furness (St. Margaret),

The Society likewise accepted the trust of a sum of money as a repair fund for the church of St. Mary and All Saints, Palfrey, near Walsall, Staffs.

THAT enterprising company the Belle Steamers, in anticipation of the wants of holiday makers, have, while maintaining their regular sailings, arranged a splendid programme for the August Bank Holiday period. Some of the special features are an express steamer to Southwold and Yarmouth at 8.45 on Saturday, August 2, and an express steamer to Clacton, Walton, Felixstowe and Harwich at 9 A.M. on Saturday, August 2, Sunday, Bank Holiday and Tuesday. Passengers travelling by this boat to Felixstowe and Harwich can return the same day, which they are unable to do at ordinary times. To avoid overcrowding on the Saturday preceding August Bank Holiday they have withdrawn the Nore steamer and utilised her for one of the other trips, and passengers will appreciate the extra comfort thereby insured. The Nore steamer will run, however, as usual on Sunday, Bank Holiday, and August 5, 6 and 7, calling at Southend on August 4 and 5. In addition to the above the steamers are running on Friday, August 1, and passengers able to leave town that day would do well to avail themselves of the opportunity. It is pleasing to note that the company do not raise

their fares on special occasions, and passengers are advised to book beforehand at the head office, 33 Walbrook, or at the booking-offices on Fresh Wharf, which are open from 8 A.M. to 9 P.M. Further particulars and special handbills giving the above information in detail can be had from the head office, 33 Walbrook, E.C.

### ARTISANS' DWELLINGS IN BRIGHTON.

A STATEMENT has been prepared showing the cost of thirty small houses erected by the Brighton Corporation on the Dews Road site. The outlay was as follows:—

Amount of contract, including extra works, 6,058*l.*; pavements, roadways, &c., 317*l.* 5*s.* 10*d.*; cost of sewers, 155*l.* 3*s.* 10*d.*; laying in branch drains, &c., 32*l.* 5*s.* 6*d.*; sundry expenses, advertisements, printing, &c., 20*l.* 16*s.* 3*d.*; total cost, 6,583*l.* 11*s.* 5*d.* This was equal to 219*l.* 9*s.* per house. Assuming the money was borrowed for forty years, an annual sum would be required for interest and redemption (at 4*l.* 15*s.* per cent., the rate at which the last issue of stock was borrowed) of 10*l.* 8*s.* 6*d.*; house let at 6*s.* 1*d.* per week would yield per annum 15*l.* 16*s.* 4*d.*, less one-third for outgoings, 5*l.* 5*s.* 5*d.*; total, 10*l.* 10*s.* 11*d.* It would be seen that the total cost per house is 219*l.* 9*s.*, and that if the houses were let at 6*s.* 1*d.* per week they would, after allowing one-third for outgoings, produce a little more than sufficient to pay the interest and instalment for redemption of debts on the money borrowed. Several members of the Council expressed the opinion that an allowance of one-third for outgoings was not sufficient, and asked for a statement of the charges actually paid in respect of outgoings in the case of the St Helen's Road houses. The committee submitted a statement of receipts and expenditure in respect of the thirty houses in St. Helen's Road, which has been prepared by the borough accountant, showing that the outgoings did not amount to one-third of the rents, but it must be borne in mind that the houses were new, and that consequently during the past year the cost of repairs was exceedingly low, amounting only to 8*s.* 4½*d.* per house. Having regard to the recent increase in local rates (which were now 5½*d.* in the £ more than they were at the same date last year), and to the increase of 2*d.* in the £ in the amount of King's taxes paid last year, the committee were of opinion that the houses could not safely be let at a less rent than 6*s.* 6*d.* per week if it was intended that they should not involve a demand on the rates.

### LIABILITY FOR PAVING FOOTWAYS.

A SUMMONS was heard at the Lambeth Police Court, which was taken out by the Camberwell Borough Council against Mr. Frederick End, to recover the sum of 26l. 17s., being the proportion apportioned upon him, as an adjoining owner, of the estimated cost of paving the footways of Half Moon Lane. The point at issue was whether the Council were entitled to deal with Half Moon Lane as a new street within the meaning of section 105 of the Metropolis Local Management Act, 1855, and to charge the expense of paving the path upon the adjoining owners. It was admitted that the lane was an ancient highway, but the contention of the Council was that by reason of the extensive building operations which had taken place during the last few years it had now acquired the character of a new street, and could be dealt with as such. That contention was contested by the defence, and numerous authorities were quoted on both sides. Mr Hopkins, in giving his judgment, said that up till about as late as the year 1873 or 1874, and probably as late as the year 1880, this road might have been very well described as a thoroughly good old suburban London road, with nice houses on each side of it—twelve or thirteen in the whole length, perhaps—with good gardens, with drives and lodges, and generally with houses of a nice character. Now, the whole of the estates had been cut up, and roads had been run through the gardens and grounds and houses had been built, and the whole neighbourhood had altered its character. He found as a fact that the lane had become a new street within the meaning of the statute, and his judgment, therefore, was for the Council for the amount claimed from the defendant.

### MOTOR CARS AND MUNICIPAL WORKS.

At the annual meeting of the Municipal and County Engineers in Bristol, Mr. E. Manville read a paper on motor vehicles for borough and county work. He said:—That there are great possibilities for the self-propelled vehicle in connection with borough and county work few will deny, but it is doubtful whether the full extent of the numerous purposes to which it can be put is fully realised at the present moment, for, unfortunately,

but few really serious attempts have so far been made to utilise the new form of locomotion in this direction; and the author therefore trusts that the few following remarks he has to make on this subject may serve as a basis for reflection in the minds of municipal and county engineers as to the possible application of motor vehicles towards facilitating their work and decreasing the costs that are at present being incurred by the employment of horse propulsion. Up to the present some of the more enlightened local authorities have organised services for street watering and dust-collection by means of motor vehicles, and, moreover, some attempt has been made in one or two cities to employ the motor in connection with fire-brigade work. The scope of the automobile is so far-reaching that these experiments are comparatively insignificant, and give but the slightest idea as to the greatest results eventually to be secured. The design and construction of the self-propelled vehicle have to-day reached a standard of excellence which renders it eminently suited to all classes of work; and serious consideration should be given to the claims put forward on its behalf. The main questions are economy and reliability of running, and, perfected as it now is, the motor vehicle embodies both qualities to a very marked degree. Motor carriages can be employed by municipal and county bodies in many different ways. What better means of conveyance could be adopted by city engineers, county surveyors, chiefs of police or fire-brigades, or other civic officials whose duties so often require prompt attendance at some distant spot? A couple of minutes after a hasty summons a motor carriage could be got away, and running rapidly and smoothly through the traffic, convey the fire-brigade chief to some fierce outburst or the chief of police to the scene of a disturbance. No waiting for preparations, but an instant departure, and a journey made at a speed as fast as it is untiring. That some chiefs of fire-brigades realise the ability of the motor vehicle received corroboration only a few weeks ago, when many of the illustrated papers reproduced pictures showing Mr. Croker, the head of the New York brigade, seated in his car. Successful tests in this direction were also made with the Daimler carriage in one of the Midland towns a little time since. City engineers and county surveyors should also gladly welcome a light, fast and reliable vehicle, as by its means their duties could be much more expeditiously performed, and they would be always assured of quick arrival at any given spot when urgent need arises. Motor water and dust carts are already in use, but

only to a limited extent; yet they perform their duties so admirably that considerable expansion in this direction may be safely anticipated, and with it the appearance of self-propelled street scavengers and other machines of special design for the public service.

The President said his experience of motoring was not very satisfactory.

Mr. Mawbey said nothing did him more good than a ride of 10, 20 or 40 miles in a motor car, but it was false economy, he pointed out, to go in for a vehicle at a less cost than 40%.

Mr. Hooley said he, had been able to do in 36 hours what it had formerly taken him a week to do under the old order of things, and at a quarter less cost. He did not think that the motor car could be advantageously used for heavy hauling work, and he advocated the hiring of cars for borough work rather than purchasing a vehicle outright.

Mr. Weaver favoured the use of motor cars in municipal work.

Mr. Winter said in his borough (Hampstead) motor cars had been most advantageously used for street watering and cleansing, one car doing the work of four horses.

The President, in closing the discussion, said it had been shown, he thought, that there was a future for a heavy motor in towns, but the cost must be considerably reduced first.

### NEW BATHS AND GYMNASIUM, DUNFERMLINE.

DUNFERMLINE was *en fête* on the 16th inst., the occasion being the laying by Mrs. Carnegie of the foundation-stone of the new and important public buildings which, when finished, Mr. Carnegie will present to his native town.

The bath buildings occupy a site on the east side of Pilmuir Street, along which they will extend 260 feet. As previously described in the *Dunfermline Press*, the main front of the buildings is composed of a centre block of two storeys, flanked respectively on the right and left by buildings each of single storey, and on the extreme left the elevation is extended in a separate composition of simple design, forming a group of Turkish baths in two storeys. The centre block contains the entrance hall and a spacious vestibule, on either side of which is the ticket-office and a ladies' room, with costume and shoe store.

Facing the entrance are the main entrances to the pond hall on the left and the gymnasium on the right. Both of these are behind the main building.

The pond hall is a handsomely-equipped and well-lighted apartment, 92 feet 6 inches by 58 feet 6 inches, containing swimming pond, 75 feet by 35 feet, also two commodious spray-rooms and an instructor's room. On each of the two sides of the apartment there are upwards of fifty dressing-boxes, and by an ingenious arrangement of hinging the box divisions are made to fall aside; and the side floors being staged, the space can be seated for an audience, on gala occasions, of about 350 persons, in addition to 400 more provided for in the gallery which is carried round three sides of the hall.

The gymnasium is a lofty and well-lighted apartment, 103 feet by 45 feet, with a gallery on three sides. Provision is made in it for the introduction of all the latest appliances for gymnastic exercises for both sexes. On one side of the gymnasium are separate dressing and spray-rooms for the sexes, with an additional apartment on the basement floor, to be used as auxiliary accommodation on special occasions if required.

The entrance and exit for these apartments are so arranged as to secure perfect privacy to each of the sexes in passing to and from the gymnasium.

In the front building to the left of the centre block is the section comprising the slipper baths. It is arranged for fourteen plunge and nine spray baths, each with a separate dressing-box, the whole being grouped in a lofty well-lighted apartment, but with separating passages for the attendant controlling the baths under use. Special appliances for ventilation and radiators for heating are provided throughout. The Turkish baths immediately adjoin. They comprise the usual succession of hot, shampooing and cooling apartments, Russian vapour baths and plunge pond, all being of liberal dimensions and fully equipped.

To the right of the centre block is a large handsome billiard hall, accommodating three full-sized tables, together with oriel and ingle neuk recesses for table games. The hall is furnished with separate lavatory, which is approached immediately from the main entrance, so that those engaging in the game may not be required to pass the turnstiles placed for ticket-holders to the baths.

Committee and reading-rooms are provided above the entrance hall in the centre block, and over the gymnasium dressing-room is a commodious residence for the caretaker.

TURBINE DYNAMOS,  
PUMPS and FANS.

No. 6395, DE LAVAL PATENT STEAM TURBINE DYNAMO.

SEND FOR CATALOGUES.

who, by private pass doors, has through communication to all parts of the building.

Under the Turkish bath block are engine and boiler-house for heating and hot-water supply throughout, and for the generation of electricity for lighting. There are also wash-house and laundry, with special drying closet, and an engineer-fitter's workshop.

A special "Sturtevant" heater for Turkish baths is, likewise, accommodated on this floor.

In maturing the plans, the most modern baths in various parts of the country have been visited, and useful information gathered and applied, so as in every way to make the result worthy the generous donor, and up to the full requirements of the town.

The buildings are designed in a simple phase of Renaissance, and promise to result in a simple, dignified and appropriate composition, the whole being faithful to the arrangements of the plan.

The stone used will be from Swallowdrum, a well-known local quarry.

Internally, the finishings will be of a tasteful, appropriate and durable quality, tinted enamelled tile and brickwork being judiciously disposed where plaster would be unsuitable.

It is expected that the total cost will be about 35,000*l*.

The architect is Mr. Hippolyte J. Blanc, R.S.A., 25 Rutland Square, Edinburgh.

### BUILDER'S ASSIGNMENT.

IN the Court of Appeal on Monday, in the case of Hughes *v.* the Pump House Hotel Company, Ltd., the defendant company appealed from an order of Mr. Justice Channell in chambers, confirming an order of Master Chitty and substituting Lloyds Bank, Ltd., as plaintiffs in the action. It appeared that the defendant company own the hotel known as the Pump House Hotel at Llandrindrod Wells, Radnor, South Wales, and that they entered into a contract with the plaintiff, Mr. Ralph Merton Hughes, of Birmingham, in 1899, to build on to the hotel a new pump-room and bar at a cost of over 6,000*l*., and to make other structural alterations and repairs to the premises, the contract for the whole of the work being for 9,338*l*. On March 7, 1901, the plaintiff assigned to Lloyds Bank, Ltd., the right to receive and, if necessary, to sue for all moneys then due or to become due under the contract from the defendants to him, and empowering the bank to give full receipts for moneys they received from the hotel company on his behalf. At the time this action was commenced the plaintiff, Hughes, alleged that the hotel company still owed him 2,788*l*. The company, having received notice of the assignment, objected to pay the plaintiff, on the ground, among others, that such payment would not prevent the bank suing them for the money under the power to obtain payment conferred on them by the assignment. The action having been brought by Hughes, the hotel company applied to Mr. Justice Wright in chambers to stay the action unless Lloyds Bank were added as plaintiffs. That learned judge held that the plaintiff could, in spite of the assignment to the bank, still maintain the action. In his opinion the assignment was not, as the defendants contended, an absolute assignment, but amounted only to a continuing security to Lloyds Bank for money advanced by them to the plaintiff. On the matter coming before the Court of Appeal, however, that decision was reversed, their lordships being of opinion that the assignment was absolute and that therefore Hughes could not bring the action. Thereupon an application was made to Master Chitty in chambers under the rules of procedure which gave the Court power where a bona-fide mistake has been made, to add or substitute a person as plaintiff, to substitute Lloyds Bank for Hughes. This the Master did, and Mr. Justice Channell confirmed his order; hence the present application for leave to appeal.

Their lordships refused leave to appeal. In their opinion a bona-fide mistake was made, and therefore Mr. Justice Channell and the Master had jurisdiction to substitute Lloyds Bank for Hughes as plaintiffs.

The application was dismissed with costs.

### LONDON SCHOOL BOARD BUILDINGS.

THE annual report of the works committee of the School Board for London has been issued. It appears that during the year ended March last the Board agreed to purchase interests in thirty-eight sites at a cost of 105,959*l*., the surveyor's fees being 606*l*. The value of all the sites, including these amounts, purchased or agreed to be purchased by the London School Board up to the end of the year under review is set down at 3,749,488*l*., and the costs in connection with them have amounted to 521,565*l*. According to a table prepared by the

finance department, the average cost of the sites for 445 schools was 7*l*. 3*s*. 8*d*. per child. The total number of permanent schools erected and opened up to Lady Day, 1901 (exclusive of transferred schools, which have been improved but not enlarged, and which are also considered as permanent) was 450. During the past year thirteen additional schools and ten enlargements of existing schools were opened, providing a total accommodation for 16,200 children. A pupil-teachers' school, which had been erected on the Offord Road site, Barnsbury, to accommodate 312 students, was also opened. The divisions in which these schools were required are the centres where the growth of the population of the School Board class demanded the accommodation supplied. They are:—Chelsea, Finsbury, Greenwich, Hackney, West and East Lambeth, Marylebone, Southwark, Tower Hamlets and Westminster. The total amount of the loans which the Board of Education authorised the School Board to incur on account of the above thirteen new schools and sites, and also the pupil-teachers' school, excluding three cases where the loans for the sites have not yet been sanctioned, and one case where the loan for the buildings had not yet been applied for, was 441,003*l*., and on account of the ten enlargements 108,304*l* for the buildings only. The average cost per head of the buildings and furniture of 445 schools, the accounts for which had been completed at September 29 last, was:—School buildings (exclusive of sites), 14*l*. 1*s*. 1*d*.; furniture and fittings (such portion as is charged to capital account), 11*s*. Tenders have been accepted during the year for erecting eight new schools, providing additional accommodation for 7,112 children and a pupil-teachers' school for 312 students; also for erecting nine enlargements of schools, including the building of a new senior mixed school, providing additional accommodation for 2,452 children. Tenders have also been accepted for carrying out a variety of other works, including a cookery centre, six laundry centres, two housewifery centres, two domestic economy schools, eight manual training centres, six schools for special instruction and rooms for teaching the upper standards in connection with eight higher-grade schools; and the total amount of the tenders accepted for carrying out drainage and sanitary works at seventeen existing schools is 39,727*l*. At Lady Day last the amount of school accommodation in course of provision was as follows:—Twelve schools were in course of erection, providing 10,634 school places; ten enlargements were in progress, providing 2,657 places; thirty-six additional sites for new schools had been or were being purchased, the schools to be erected on twenty-five of which will provide for 20,168 children; nine sites for new schools had been scheduled, the schools on seven of which will provide 5,450 places; thirty-two enlargements had been sanctioned, providing for 9,964 children; and the Board of Education had in seven districts sanctioned the provision of sites, the schools to be erected on three of which would provide for 1,750 children.

The report, among other detailed information, states that the playgrounds of 257 schools are now open on Saturdays, and of forty-six schools on Sunday, for the use of the children.

### SELLY OAK WORKHOUSE.

THE foundation-stone has been laid of new buildings which, when fully carried out, will double the accommodation at Selly Oak workhouse. Towards the end of last year it became evident to the Guardians of King's Norton Union, as well as to the Local Government Board, that the accommodation in the house was not sufficient to cope with the rapidly increasing population and the corresponding increase in the number of paupers. The house committee, especially their chairman, Mr. Joseph Walter, went into the matter very carefully, and decided that the most economical and satisfactory scheme would be one which provided for the probable requirements of the next thirty years. In formulating their plan of operations they were handicapped by the fact that the existing buildings had not been laid out with a view to future requirements, and the block which ought to be extended came too near the road. Already the original entrance was closed, and it was decided to make a new entrance at the extreme left of the workhouse and to build a new block on the waste ground further to the left. This is to be utilised as the female wards, and eventually all the old wards will be devoted to male occupants, so that the sexes will be divided by the new carriage drive. That part of the scheme which is now being carried out comprises five buildings:—(1) A new entrance lodge, containing a porter's room, a waiting-room for paupers' friends, and receiving room for males and females, with bath-room and other sanitary arrangements; (2) the first of three pavilions, 230 feet long and three storeys high, with windows on both sides, to accommodate 1,000 inmates; (3) a large store for paupers' clothes, with disinfecting apparatus, and offices for the master and clerk; (4) matron's office and sewing-room; (5) wood-chopping shed and timber store. Mr. W. Harvey-Gibbs contracted to erect the buildings for 18,700*l*. It is estimated that the engineering

work, fittings, architects' fees and incidental expenses will make up the total cost to 25,000%. The architects are Messrs. C. Whitwell & Son, of Birmingham, and the clerk of the works is Mr. George Tallis. Operations were commenced before Christmas, and the stores and matron's office are already built, and the walls of other buildings have reached a considerable height.

### MASONIC HALL, RIPON.

THE foundation-stone of a new Masonic hall was laid at Ripon on the 11th inst. The new building, which has been designed by Mr. T. Wall, architect, will face south, the frontage being to Water Skellgate. It will be a two-storey brick building, faced with machine-made pressed bricks from the Littlethorpe Brick and Tile Company. The main entrance will be in stonework of a free Classical design, in the form of two pilasters with Ionic caps, supporting a projecting stone door-head, under which will be carved a Masonic device. On entering the premises there will be a staircase hall, 16 feet 6 inches long and 9 feet 6 inches wide, this being divided from the vestibule by a glazed screen. The hall will be well lighted and fitted up with lavatory and cloak accommodation, and it will have a mosaic tiled floor. The first floor will be gained by a pitch-pine staircase, 4 feet wide and of easy ascent. Entered directly from the landing will be the ante-room, 20 feet by 11 feet, this being provided with a small private door from the tyler's lobby, the latter effectually shutting off the landing from the lodge-room. This room will be 33 feet long by 21 feet wide and 19 feet high, and will have a domed ceiling rising from an enriched moulded cornice. A natural system of ventilation will be provided by means of fresh-air inlets and Boyle's air-pump ventilator on the roof, with proper regulating valves. The floor will be in maple secret nailed, and at the east end of the room will be a raised dais, having as background a high dado with circular cornice, and covered with anaglypta of simple but appropriate design. Adjoining the lodge-room will be the tyler's store-room, 11 feet long by 4 feet wide, which will be well lighted so as to enable it to be used as a dressing-room for visiting brethren. There will be another room, 17 feet by 15 feet, entered from the landing, which will most probably be used as a library or reception-room. On the ground floor there will be a dining-room, 22 feet by 21 feet. This will be entered from

the vestibule through a lounge. Attached to the dining-room will be a service-room and kitchen, the latter having a separate entrance into the road, enabling this portion to be entirely shut off from the remainder of the premises, without in any way stopping work in that department. Between the dining-room and the hall will be a smoke-room, 16 feet by 11 feet, having cross ventilation. The whole of the woodwork throughout, except the lodge-room, will be in pitch pine and varnished. The lodge-room will be in deal, finished all through in white enamel. The surplus space on the ground floor will be devoted to the construction of a good lock-up shop, 25 feet by 16 feet, having windows into High and Water Skellgates, with a good corner entrance and spacious store cellar.

### WESLEYAN CHURCH, BOLTON.

A NEW Wesleyan church is being built in Chorley Old Road, Bolton, the aim in the design for which has been to secure a building thoroughly adapted to the needs of the congregation, and suitable to the form of service usual in the Wesleyan Church, which requires that the bulk of the congregation should be immediately round the speaker, and all should be able both to see and hear without any difficulties of intervening pillars. To realise these aims an approximation of the Greek cross style of plan has been adopted, that is, with four practically equal arms for the pewed space, an arm being lengthened by entrances and vestibules. This plan has also the additional advantage of massing the congregation together instead of dividing it into three, as is the case with the usual transeptal arrangement. As the width of the four arms inside is 38 feet, and pillars were felt to be undesirable, the roofing needed serious consideration. The style was in a measure restricted by that of the adjoining school, and a barrel vault was the natural form of ceiling. But barrel vaults simply intersecting at the crossing are bald and uninteresting, and it was determined to add to the interest and importance of both interior and exterior by placing a dome at the intersection, of a flat saucer type, carried down by pendentives to the springing line of the barrel vaults. On this dome is a massive turret which will be open to the interior, giving an eye of light at the apex and preventing the gloomy appearance of a closed-in dome. Two low towers at the front, containing the gallery entrances and staircases, will also be roofed with shallow domes, echoing the note struck by the central feature.

## ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889.)

ROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for Framing.

**THE EXALTATION OF ART.** (Ceiling Painting in the Hôtel de Ville, Paris.) By Mons. LÉON J. F. BONNAT. (Printed in Colours.) Size, Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

**MISTER BUNBURY.** From the Painting by Sir JOSHUA REYNOLDS. Size, Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

**S. PAUL PREACHING AT EPHESUS.** By EUSTACHE LE SUEUR. From the Painting in the Louvre. Printed in red or black. Size, Thirty Inches in depth by Twenty Inches in width. Price, Two and Sixpence each; free by post, carefully packed inside patent roller.

**A TURKISH MASSACRE.** From the Painting by EUGÈNE DELACROIX. Size, Thirty Inches by Twenty-two Inches. Price, Two Shillings each; free by post, carefully packed inside patent roller.

**A ITALIAN GIRL.** By WALTER BLACKMAN. Size, Thirteen and a Half Inches by Nine and a Half Inches. Price, Sixpence each; free by post, carefully packed inside patent roller.

**PANELS BY F. BARTOLOZZI, R.A.** After J. B. CIPRIANI, R.A. Printed in the famous Bartolozzi red. Size, Twenty-six Inches in length by Fifteen Inches in depth. Price, Three Shillings and Sixpence the Pair; free by post, carefully packed inside patent roller.

**THE ROMANS OF THE DECADENCE.** From the Painting by THOMAS COUTURE. Size, Twenty Inches by Fourteen and Three-quarter Inches. Price, One Shilling and Sixpence; free by post, carefully packed inside patent roller.

**THE GALLAND FRIEZE.** From the Wall Paintings in the Hôtel de Ville, Paris, by P. V. GALLAND. Eighteen pieces printed in Terra Cotta with Gold background.

N I. ARCHITECTURE.	No. VII. POTTERY.	No. XIII. TURNING.
N II. BRICKLAYING.	No. VIII. SCULPTURE.	No. XIV. SMITHS' WORK.
N III. STONE CUTTING.	No. IX. GLASS WORKING.	No. XV. ARBOICULTURE.
N IV. CARPENTRY.	No. X. ENGRAVING.	No. XVI. ARMOURERS.
N V. JOINERY.	No. XI. METAL WORKING.	No. XVII. TEXTILE DECORATION.
N VI. PAINTING.	No. XII. FOUNDING.	No. XVIII. MUSICAL INSTRUMENT MAKING.

Size of each Plate, Twenty Inches in length by Thirteen and a Half Inches in depth. Price, Twenty-five Shillings the set of Eighteen pieces; free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the Publishers, GILBERT WOOD & CO. Ltd., 6-11 Imperial Buildings, Ludgate Circus, London, E.C.

The choir will be in stalls on a spacious platform raised 3 feet above the floor of the church. The rostrum will be in the centre, coming forward from the choir and the organ in a recess at the back. It is believed that this arrangement will work well for the leading of the singing without making the members of the choir too conspicuous, and will be equally good whether side galleries are put in or not. The minister's vestry and choir vestry will communicate directly with the choir platform as well as by the steps from the church at either side of the rostrum. The front entrances have been carefully studied and will not be of the cramped nature so often seen. The outer doors open upon a narthex 25 feet by 6 feet, and doors from this into an inner vestibule 25 feet by 8 feet. The gallery entrances are separate from those of the ground floor, thus preventing the crowding of the two sets of people meeting in the doorways. The length of the building is 100 feet and the outside width 65 feet. The dome inside will rise to a height of 50 feet from the floor, and the top of the turret 65 feet. The accommodation, including end gallery which will be put in now, will be 650, and side galleries which could be put in later without structural alterations would bring it up to 850. The interior woodwork will be pitch pine, the aisles are to be concreted and tiled, the ceiling plastered. The outside materials are red Ruabon brick and Yorkshire stone. The windows will be of leaded glass in plain clear squares. The contract has been let to Messrs. J. H. & G. Marsden. The architects are Messrs. Potts, Son & Hennings.

### WITTON HALL, BIRMINGHAM.

WITTON HALL, the new home of the Penn Street Industrial school, Birmingham, is a substantially built, lofty, three-storey, square, red-brick house, Georgian in its appearance, with low-pitched slated roofs partially concealed by parapets carried above a moulded stone cornice, with massive lofty chimneys. The tall sill-less sash windows with thick bars and small panes common to that period give abundance of light to the interior. The old floors are of oak, and some of the walls are lined with oak panelled wainscot. An interesting feature is the old oak staircase with its moulded balustrade.

Previous to the recent alterations there were five rooms on each floor, one of which was the kitchen. A low two-storey wing with tiled roof running east and west contained the

scullery, pantries, washhouse, laundry, &c., with bedrooms over, a second wing at right angles to the first forming the third side of a quadrangle consisted of a coach-house, stable, cow-house and pig-styes.

In the alterations now completed, by removing several walls, &c., a large portion of the ground floor of the house block has been converted into a dining-hall 48 feet by 19 feet. On the floor over a dormitory of similar dimensions has been constructed accommodating twenty-six beds. The remainder of the house is now used as the superintendent's residence.

The old scullery-wing has been extended, its walls thickened and roof raised, giving space on the ground floor for a new scullery, pantries, a boys' lavatory with twenty-four basins, and a bath-house containing a bath lined with glazed white bricks, and measuring 17 feet 6 inches by 6 feet 6 inches and 3 feet deep. The upper storey has a dormitory 61 feet by 17 feet 6 inches, accommodating twenty-nine beds, and a sick-room with an independent staircase entrance for isolation; also a master's bathroom.

The stable wing has been cleared out and made to accommodate carpenters', shoe-makers' and tailors' workshops, wash-house, laundry and store-room.

A new wing has been erected on the south-east side of the house, containing the schoolroom, 38 feet by 24 feet by 16 feet high, to be used also as a gymnasium, the principal staircase, and a dormitory over the schoolroom, 38 feet by 24 feet, accommodating twenty-five beds. Each dormitory is under the control of a master, whose bedroom adjoins and has a small window for inspection.

A one-storey wing has also been added, containing the office for superintendent and committee and an officers' sitting-room.

A playground has been formed in the rear and a play-shed, 64 feet by 16 feet, which will eventually be enclosed.

The buildings are warmed by hot water on the low-pressure system, which has been supplied by Benjamin Parker, Ltd., of Birmingham. Automatic ventilators and fresh-air inlets have been arranged to give a good supply of fresh air, and the interiors and entrances are lighted by gas.

The work has been carried out by Messrs. Mills & Son, of 35 Leopold Street, in a most satisfactory manner from the plans and under the superintendence of Mr. Freeman Smith, architect, of 88 Colmore Row.

The Lord Mayor of Birmingham opened the building on Thursday, July 17, the total cost of which, including the freehold, was 6,360*l*.

## THE WEEK.

THE verdict of the jury who heard the evidence about the fatal fire in Queen Victoria Street was not expected to refer to only one cause of the deplorable results. In our remarks which appeared in the same week, while pointing out the lack of organisation on the part of the authorities, we dealt also with the character of the structure, the absence of provision for escape, and the use of the premises as a factory. The managing director said there was only 168 lbs. of an inflammable mixture kept on the premises, but Mr. WOODTHORPE, the district surveyor, in his evidence stated he watched the fire from another building, and from the appearance of the flames and smoke he concluded that inflammable material must be burning, and the next morning he was surprised to see how little the structure was damaged. He also recorded a fact which is not sufficiently dwelt on by the authorities, that there are several premises in the City having parapets which had no means of escape for employes in case of fire; indeed, there were many places which were really death-traps, and something should be done to remedy it. It was at the same time observed by him that the London County Council, under the Factory Act, had no inspectors. The only inspectors were provided by the Home Office, consequently the County Council could not move until a building had been reported to them as being a factory. From what was reported in the House of Commons it is evident that the Government inspector had some doubts on the subject, but in this instance, as in others, the letter of the law was respected rather than protection against contingent outbreaks. The action of the Home Office in the affair is not of a kind which will give encouragement to those who work in factories. We have laid stress repeatedly on the necessity for the appointment of inspectors who are architects, and who will estimate risks not merely as to their correspondence with regulations which were penned by men without practical knowledge, but in their likelihood to become dangerous to structures, and consequently to the operatives in them. The inadequacy of the means provided by the County Council has been daily discussed since the fire occurred, and we need not emphasise a fact which is palpable to all outside Spring Gardens and Southwark. There will have to be improvements, but as long as the Factory Acts are administered on red-tape lines a danger exists for which no fire-ladders are a sufficient remedy.

CLAIMS to footpaths are not upheld without undergoing a large expense, but the right to use them is now esteemed so important, county councils are expected to uphold popular claims as a duty. From the circumstances under which the use of the footpaths originated it is always extremely difficult to discover evidence which will satisfy a judge and jury. An instance of the kind has occupied Mr. Justice PHILLIMORE and a special jury at Lewes during several days. Two or three paths were claimed by the East Sussex County Council as open to foot passengers on an estate belonging to Lady MARGARET CECIL at Burwash. But the contention was more especially over two of them. The point to be decided was whether they could be treated as public highways prior to 1876. A great many old people gave evidence, but there is a widespread belief that age cannot distinctly recall events which occurred nearly forty years ago. In all such trials it is practically impossible to produce any record of the intention of an owner to allow a right-of-way. One peculiarity of the case was that "heave" gates existed at some points, and it was contended on behalf of the owner of the estate that they were not easy to manage by women, and would not have been introduced as obstacles on a public footpath. According to Mr. Justice PHILLIMORE, a highway, with certain exceptions, can only become public by dedication on the part of the owner of the soil over which it passed. The jury replied to all the questions put to them by his Lordship about the paths being public highways in the negative. A declaration to that effect was made and an injunction granted against the defendants. It is needless to say that the result will not

generally be accepted as satisfactory, but when such cases come into Court and are not settled by mutual agreement, public rights have to succumb to the laws of evidence.

LOVERS of ancient architecture in France profess to be greatly pleased by the promotion of M. SELMERSHEIM to the rank of officer in the Legion of Honour. He is a native of Langres, and after obtaining medals for his designs at various exhibitions of the Salon, he won a gold medal in 1889. He is the senior among the inspectors of the historic monuments, for he has held that office during fifteen years. Previously he served the Commission as architect for thirty years. M. SELMERSHEIM has had, therefore, an official career of forty-five years. Among the restorations he has accomplished are the church of St. John and St. Urbain at Troyes, the belfry of Beaune, Noyons and Chartres cathedrals. He was always recognised as one of the few conservative restorers. He never sought a reputation for magnificent operations, and it cannot be said that any venerable building has suffered much at his hands. It is devoutly wished in France that his promotion may be regarded not merely as a reward for faithful services, but as an indication of the intention of the French Government to encourage restorers of the type of M. SELMERSHEIM.

JEHAN GEORGES VIBERT, the French painter, who died on Sunday last, afforded an example of an artist who could not be called successful until he hit upon a particular class of work. He used both oil and water-colours with efficiency, but without gaining general admiration. Then he made subjects of cardinals, and their brilliant robes, being well painted, were never passed unobserved. He found that purchasers preferred that he should imagine weak points in the characters of the ecclesiastical princes, and with true French malice he adhered to that mode of representation. He was familiar with the stage, and although some of his pictures may be regarded more as farces or extravaganzas than as comedies, there can be no denial of the dramatic skill with which they were depicted. A couple of cardinals listening at a keyhole might not be an edifying spectacle, but it afforded amusement to Frenchmen and encouraged the painter to pursue his prosperous course. To represent the young prelates of the Roman Court bored at the recitals of a missionary friar, or a party of tilers amusing themselves by a spectacle in a French convent of a kind that was left to the imagination, might be condemned as a degrading task, but it suited M. VIBERT. It is not easy, however, to pander to the taste which enjoys such works; the public grew tired of M. VIBERT's ecclesiastics, and when he tried his hand at other themes he was looked on as a failure. There was no doubt he was endowed with talents which, rightly controlled, might have produced excellent cabinet work. But the value of his pictures cannot be better suggested than by saying they once won him a third-class medal.

THE Musée Carnavalet has been enriched by the door from the house in the Rue d'Argenteuil which was occupied by PIERRE CORNEILLE, and in which he died on October 1, 1684. It is the gift of M. SARDOU, the dramatist. It is an acceptable acquisition, for the Musée abounds in relics of old Paris, and moreover, in the mansion which has been constituted a museum, the relative merits of CORNEILLE and RACINE were constantly discussed, for there lived Madame DE SÉVIGNÉ. The Rue d'Argenteuil was completely transformed in connection with the construction of the Avenue de l'Opéra. It seems hardly credible that the street owes its name to a village to which it served as an approach. During the operations which were necessary for the Haussmannising of that part of Paris, the house numbered 18 where CORNEILLE lived was demolished. M. SARDOU in passing asked the contractor for the door, and it has been in his possession for a quarter of a century. It is believed CORNEILLE's house was at one time part of a convent, and the thickness of the wood, which bristles with nailheads, is enough to suggest that the defence against intruders was more massive than an ordinary door. In the house, the dramatist's brother THOMAS, who was also a poet, was joint occupant, but neither could be called wealthy men. PIERRE CORNEILLE was interred in the neighbouring church of Saint Roch, where there is a monument to him.

## LIVERPOOL CATHEDRAL COMPETITION.—II.

NO. 71 is a collection of very good drawings, comprising a Byzantine scheme illustrated by a plan and the elevation of the west front, which show a dome centre and two campaniles cleverly treated in a distinctly academic manner—a Gothic organ front, and a fully designed Gothic cathedral with plan on regulation lines. The west front has two cleverly conceived towers with connecting arcade across the nave, the whole effect being very strong and dignified. The entrances, an arrangement of triple porches, are in advance of the main front, and present the appearance of a screen, masking the growth of the building at the base, which mars what is otherwise a good façade. At the crossing there is a square tower terminating in a spire, and the transepts are flanked by side towers which rise through the aisle roof between two of the buttresses, thus purposely exhibiting the end buttresses, instead of getting rid of them altogether by permitting the towers to serve their rightful purpose. The style is Late Gothic, sufficiently modern in character and marked by much scholarly treatment—a very good example of quality without any overstraining after originality.

Nos. 38, 44 and 95 are all schemes based on the wide-nave principle. The first mentioned is a distinct effort at originality, both in plan and elevation. The nave is broadly divided into three parts, the two end ones being crowned by towers the full square of the nave span, each similar in external treatment, the tops being domical and each supported by transepts, the whole being somewhat in the form of a double cross, with the extremities identical in form and elevational treatment. The result is a cathedral with balanced and symmetrical side elevations which presents no external indication of its internal disposition; nothing to distinguish the sanctuary and give proper meaning to the building. The style is individual and cannot be exactly defined; but the work throughout exhibits much ability and no little originality of a thoroughly restrained character.

No. 44 has a nave span of 76 feet, which forms in continuous length baptistery, nave and choir. The western end projects a bay beyond two flanking towers, the bases of which with transept supports are indicated to be used as library and chapter-house. The aisles are double, the outer one being an ambulatory with two arches in each bay which carry the outer wall and clerestory, the aisle proper being deep-bayed recesses the full height of the nave arcade. The sacristy, narrower than the choir, is formed beneath the central lantern, and a morning chapel completes the length eastward. The arrangement of small vestries entered direct from the choir aisles is suggestive of a Catholic rather than a Protestant cathedral. The design is in the modern manner of freely-treated Gothic, the central lantern being particularly good, though it and other portions of the exterior would be much improved by the substitution of stone for the copper pinnacle terminations, which give the drawings at least a spotty appearance.

No. 95 also has a 76 feet nave span, but in this case the aisles are single. The arcade of nave is regular with even sized piers throughout, which, as only the alternate ones carry the vaulting, is scarcely a logical treatment for the intermediates. A variation of pier size and treatment such as is found at Laon would have given greater interest. A monster gallery for orchestra, &c., overshadows the west end. The nave is bayed at the choir to narrow the chancel width, and this terminates with an apse with four chapels and morning chapel. The exterior is over plain, and the entire absence of towers or other dominant features gives a Noah's Ark appearance, which even the high campanile which the author suggests should be built 200 feet in front of the western entrance with cloister connection fails to improve.

No. 53 is a very capable study in the Byzantine style, and the completeness with which minor details of arrangement have been worked out evidence much careful thought on the part of its author. In the battle of styles it is the only real challenge in the competition hurled against the Gothic. The plan shows an atrium with a campanile occupying the centre of the entrance front, to which it is connected by a narthex running the entire width of the building. The nave is domed, as is also the crossing, the latter being

much on the lines of St. Sophia. An apsidal-ended choir, transepts with semi-domes and aisles with large side chapels either side the nave complete the cathedral proper. An episcopal house, choristers' school and theological college are grouped around a square cloister court at the eastern end, and flanking the atrium are buildings for mission societies and chancery and diocesan offices. The proposed arrangements for the clergy and choir are carefully shown. Stalls for the presbytery are positioned around the semicircle of the sanctuary apse, with the Holy Table in advance immediately under the crown of the opening, where it will be plainly in view of the congregation. The choir and lectern occupy a position in the centre of the main domed area, and are placed on a circular raised dais in a manner rather suggestive of a bandstand. The idea has been possibly suggested by the somewhat similar arrangement of the choir in the Duomo at Florence. The exterior is treated very simply and in parts effectively; but the screening of the roof of the eastern apse with a high parapet wall gives this end an unfinished appearance.

No. 94, a Renaissance design illustrated by large and very cleverly executed drawings, is simply a magnified mausoleum, imposing in character but with nothing to distinguish it from the general type; and No. 15, also in the same style but much more suggestive of a cathedral, is very ordinary in its detail, and rather clumsy in the treatment of the central dome, the arrangement of circular openings being very barren.

Of the designs submitted by architects in other countries there is not much calling for special comment, excepting in the case of Mr. R. W. GIBSON (himself an Englishman), who exhibits the design he made for the cathedral of St. John the Divine, New York City. As a brilliant *tour de force* intended to rival the splendours of the finest continental Gothic, this design, illustrated by a wonderful pen drawing, is a remarkable effort, revelling in ornateness and pinnaced to profusion. If the competition is an international one, Mr. GIBSON should have an opportunity given him to show what he can do on more moderate lines.

Mr. W. H. BIDLAKE contributes the most interesting collection of photographs, &c., of executed work. These he has arranged very simply in a brown paper album bound together with red tape. The contents are chiefly photographs of St. Agatha's Church, Birmingham, and show much refined and skilful design and detail. Some minor work shown by working drawings is also very interesting and characteristic.

Messrs. AUSTIN & PALEY are represented by their St. George's Church, Stockport, and other interesting churches in Hertford and Coventry, and Mr. W. D. CARÖE by perspectives of his churches at Stoke Damerel and Exeter, and an interior of his design for lady chapel, St. Patrick's Cathedral, New York City; but for the remainder of those who have entered the competition relying upon past work and reputation to carry them through, few have considered it necessary to make any particular effort, and the exhibition receives no added interest from their contributions. Nor in any of this executed work is there shown any glimpse of a talent or other special quality which could be considered to confirm an opinion that these gentlemen can solve the problem of designing a cathedral for Liverpool with the hope of any greater success than has been attained by many whose work we have reviewed. We hope that the selection, when announced, will not be found to be overburdened by "reputation," but that this preliminary competition may really fulfil and realise the obligations which are due to those who have responded so fully to the invitation to compete, and have specially designed work fitted to the occasion, without whose contributions the *raison d'être* of the competition would be altogether lacking.

---

Scotsmen connected with London are desirous of erecting a memorial to those fellow-countrymen who have fallen in the war in South Africa. Funds are being appealed for to allow of the insertion of a large stained-glass window at the end of the nave of St. Columba's Church, Belgravia. The cost of the memorial, with suitable brasses or mosaics for the names of those who have fallen, will probably approach 1,000*l*.

## PICTURESQUE WESTMINSTER.

IN no part of England is the contrast between old and new more marked than in Westminster. It is not confined to buildings. Around the city, and especially the part on which the Abbey stands, the traditions go back, if not to a mythic period, at least to one which is coeval with the dawn of Christianity. It would not be possible to verify the legend of St. PETER establishing a church near the river, but during long centuries it was accepted that the Prince of the Apostles had guided a missionary enterprise on the low and dreary lands where few people were in habitation. That Prince SÆBYRHT founded a church on the Isle of Thorns in the beginning of the seventh is more firmly rooted. At a later time, 958, an abbey was placed there by King EDGAR. In the opening years of the eleventh century the church was rebuilt by EDWARD THE CONFESSOR, and in it he was buried in 1066. To the pious king the erection of the parish church of St. Margaret can also be ascribed.

The antiquity is suggested also by the greatest of our secular institutions. It is believed that national councils existed from a remote time, and it may be assumed that as soon as royalty settled at Westminster the assemblies or parliaments were likewise held there. A statute of 1272 is the earliest record of the adoption of the word "parliament" to denote the representative assembly; but in 1215 we have in the Great Charter a promise of the king to summon various classes of Englishmen for deliberation and the voting of grants. From 1130 Lords and Commons met in different chambers. Consequently there is reasonable ground for the popular esteem of Westminster. There are venerable cities, like Winchester and York, where momentous events were transacted; but for about 1,000 years Westminster may be regarded as the part of England which is most closely connected with English history. It was the main course amidst many rivulets.

The provincial or the foreign archæologist who visits Westminster for the first time is, however, always disappointed, after wandering through streets and lanes, when he discovers so little masonry that can be called ancient. If compared with the extent of the city, Westminster Abbey and its precincts appear to be insignificant in area. The stranger will look in vain for another example of Gothic architecture. At one time the districts of St. Martin-in-the-Fields, St. Clement Danes, St. Mary-le-Strand and the Savoy were marked by Gothic churches, but all traces of them have been obliterated. The reason for the scarcity of Mediæval work can easily be accounted for by recollecting the character of the region. The Abbots of Westminster probably possessed all the ground on the west side of the Abbey which was likely to be productive. On the east and north were the royal lands of Whitehall. St. James's Park, the Green Park and Hyde Park are part of the King's demesne. There were also large gardens attached to the mansions of nobles. Charing Cross was a limit in one direction; St. Martin's and St. Giles's were, as their names denote, both in the fields, and there are several streets and lanes which also are suggestive of having been at one time country footpaths. The dates of the erection of churches give an indication of the period when certain Westminster districts were inhabited by people requiring houses. St. Paul, Covent Garden, was built in 1640; St. Anne's, Soho, in 1678; St. George, Hanover Square, in 1724. The expression "Neat Houses Gardens," for property near where the Tate Art Gallery is now situated, is expressive of an innovation in Tothill Fields. Many people who cannot be regarded as old will remember the transformation of land that was anything but picturesque into the district of Pimlico or South Belgravia.

The portfolio of drawings entitled "Picturesque Westminster," which was produced as a Coronation souvenir, under the superintendence of Alderman WALTER EMDEN, for the Westminster Council, reveals how limited is the architectural interest of the city. The seventeenth and eighteenth-century houses which stood in Wych Street and in Drury Lane have vanished. Essex Street may be considered as of the eighteenth century. The watergate at the end of Buckingham Street is possibly as old as the Banqueting Hall. Somerset House was not completed until 1786. Adelphi Terrace also belongs to the reign of

GEORGE III. The Horse Guards was erected in 1753. St. Anne's, Soho, was consecrated in 1686, and St. James's Church, 1684. The gatehouse is the oldest part of St. James's Palace.

Westminster, in a word, can be looked upon as essentially a modern city. Indeed, it has claims to be considered to be the most modern in England. Next to the Abbey and the Houses of Parliament, the portions of it that should be most prized are Great George Street and Victoria Street, with some of the adjoining and narrower ways opening out of them. No continental city, nor even New York nor Chicago, can amidst such limited boundaries point to so many offices where enterprises which alter the character of the globe are arranged. English engineers may say with reason the earth is full of their labours, for plans are prepared in Westminster offices which relate to works all over the world. It is therefore an omission of the most characteristic feature of present-day Westminster when sketches are not introduced among the plates of the streets where engineers, contractors and colonial agents congregate. The offices and buildings cannot be called picturesque, but both are typical of the new Westminster which is universally known. The fact is that in Westminster, as in most modern cities, the picturesque only exists by giving a very wide interpretation to the word. The absence of a drawing of either street becomes the more remarkable when we find a whole page assigned to the pseudo "Old Curiosity Shop," which is as presumptuous a fabrication as can be seen in Europe. If DICKENS was to be commemorated by the plates a view might well have been given in the neighbourhood of St. John's Church, where the "Doll's Dressmaker" lived, and which he clearly described. The squares of Westminster, such as Grosvenor Square, Berkeley Square, Belgrave Square, Eaton Square, are not only important features in the city, but they are interesting from their connection with English social life, and it would not be difficult to meet with materials for picturesque views in each of them.

The plates are reproductions of pencil drawings by Mr. HOWARD PENTON; they are not over-elaborately laboured, and the majority of them are very effective examples of facile sketches. The collection is an agreeable souvenir, and by accepting a copy His Majesty the KING has affirmed the value of the work. It would, however, have been an advantage if more care had been taken in the revision of the notes. When we find it stated that the existing Brompton Oratory dates from 1851, and was designed by J. J. SCOLES, the Gothic architect, it seems doubtful whether the writer was familiar with architectural history. The Victoria Embankment is said to be the best monument to the invaluable achievements of the Metropolitan Board of Works. But although the names of some ancient authors of plans are mentioned, not a word is said about Sir J. W. BAZALGETTE, without whose indomitable energy and toughness the work must have been long delayed.

The collection, however, is exactly of the kind which is best adapted to suggest the varying aspects of Westminster. Alderman EMDEN says that "the ancient and historic city of Westminster above all others in the world overflows with every phase of human interest, not only to the kingdom, but to the whole Empire." In Westminster Abbey and the Houses of Parliament we have the storehouses of two great forces which have been influential in our history. We see the religious element under several forms not only in churches like St. Clement Danes, St. Mary-le-Strand, St. Paul, Covent Garden; St. George, Hanover Square; but in the Roman Catholic Cathedral, the Oratory, the Scotch Church, where so many prophecies were once confidently interpreted. The Law Courts, which at one time were supposed to be in their right position beside the Houses of Parliament, still remain in the city of Westminster. The Banqueting Hall, if contrasted with Buckingham Palace, shows how different were the ideas of regal grandeur. Marlborough House as well as Apsley House indicate the relations between the country and victorious generals. Somerset House was originally intended to serve as a royal residence, but in 1780, before the entire building was erected, Sir JOSHUA REYNOLDS was able to welcome the Academicians and students as the occupants of a part of it, and it was their duty, he said, to endeavour that those who gaze with wonder at the structure might not be disappointed

when they visit the apartment. CHAMBERS'S work deserves to be appreciated not only for its architectural merit, but for inaugurating a more grandiose style in Westminster. The Banqueting House is only a fragment. The Horse Guards, nearly opposite to it, suggests the kind of building which was thought to be sufficient for a great purpose about the time when CHAMBERS obtained his commission. Indeed, many of the buildings in Westminster are over-

simple, as if the parish church of St. Margaret rather than the adjoining Abbey inspired the designers. The Earl of BEDFORD was only prompted by the *genus loci* when he proposed that INIGO JONES should build him a church no better than a barn. Burlington House, which shelters arts and sciences, the Charing Cross Hotel, the Town Hall, the Tate Gallery and other structures exemplify how changed is the modern taste. The people of Westminster

cannot escape the duty of raising the standard of architecture in order that it may be worthy of the historic interest which surrounds their city. We expect that in the colonies and abroad, when Alderman EMDEN's collection of sketches is seen, many will be surprised to find that streets which have a world-wide fame yet contain such a

large number of mean private buildings. The plates are an argument in favour of the necessity of extensive rebuilding, and before long we hope people will wonder how such strange structures as Victoria Station and the Royal Aquarium should be allowed to encumber prominent sites in Westminster.

## UNIVERSITY COLLEGE.

THE following prizes have been awarded in the various engineering sections:—

**Mechanical Engineering**, Professor J. D. Cormack, B.Sc.—  
**Senior Class**: Prize, W. A. Ogden, London. **Second Class**: H. E. Parker, Harrow Weald; B. C. Schroeder, Landsberg.  
**Third Class**: D. W. Ker, Sutton. **Junior Class**: Prize, E. S. Andrews, London. Certificate, 2: H. W. Allingham, London.  
**Second Class**: F. G. Helsby, Watford; P. R. Hewlett, London; Kuo Tung, Pekin; C. D. Sharp, Norwood; W. Twinch, Slough.  
**Third Class**: L. W. Atcherley, London; R. H. Cripps, Melrose; W. D. Gardom, London; C. C. A. Hardie, London; G. A. Ostler, East Finchley; T. S. Po Jui, Pekin; P. Richards, Beckenham. **Lower Junior Class**: First prize, W. A. Erlebach, London. Second prize, H. W. Allingham, London. Third prize, R. Le Rossignol, Jersey. **Second Class**: R. H. Cripps, London; K. F. Enhou, Pekin; W. D. Gardom, London; F. G. Helsby, Watford; P. R. Hewlett, London.  
**Third Class**: S. E. Garcke, London; R. E. Golden, London; A. P. Hughes, London; T. C. Linpao, Pekin; G. R. Colvin White, New Malden. **Senior Machine Design and Drawing**: First prize, W. A. Ogden, London. Second prize, B. C. Schroeder, Landsberg. Certificate, 3: D. Camacho, London. **Second Class**: V. H. Chabot, Selhurst; G. A. Grimoldby, London; H. E. Parker, Harrow Weald; F. J. White, Ealing. **Third Class**: W. H. Codner, London; L. de L. Oliva, Lisbon; H. B. Simpson, London; E. C. Taylor, Ealing; M. Toumaniantz, London; H. Wyndham, Dinton. **Junior Machine Design and Drawing**—1st Prize: W. D. Gardom, London. 2nd Prize: G. M. Clark, London. 3rd Prize: P. R. Hewlett, London. Certificates, 4: H. W. Allingham, London. 5: G. J. Hamilton, Wanstead. 6: L. W. Atcherley, London. **Second Class**: C. B. Chabot, Selhurst; C. C. A. Hardie, London; W. L. Hutchinson, Blackheath; Kuo Tung, Pekin; T. S. Po Jui, Pekin; W. Twinch, Slough. **Third Class**: L. F. Bishop, Acton; R. H. Cripps, London; F. G. Goddard, Croydon; D. W. Ker, Sutton; R. Sawers, London; M. Windsor, Banbury.

**Electrical Engineering**, Professor J. A. Fleming, M.A., D.Sc., F.R.S.—**Senior Class (Laboratory Work)**: Certificates, 1, eq. R. F. Browne, London; G. A. Hemsalech, Lodz. Prize and 3rd Certificate: B. C. Schroeder, Landsberg. 2nd Prize and 4th Certificate: F. G. Payne, London. **Junior Class and Laboratory Work**—Prize: G. M. Gibbins, Birmingham. Certificate, 2: B. A. M. Boyce, Basingstoke. **Second Class**: E. B. Cooke, London; P. E. Hart, Sutton; C. G. Peel, Porthcawl; T. S. Po Jui, Pekin; P. Richards, Beckenham; A. G. Whitfield, London; R. C. Wilkinson, Hendon; M. Windsor, Banbury. **Third Class**: C. C. A. Hardie, London; H. F. Martin, London; E. C. Taylor, Ealing.

**Civil Engineering and Surveying**, Professor L. F. Vernon-Harcourt, M.A.—**Civil Engineering**: Prize, H. Wyndham, Dinton. **Second Class**: W. A. Colegate, London; G. A. Grimoldby, London; H. E. Parker, Harrow Weald; N. E. M. Roxby, London. **Third Class**: V. H. Chabot, Selhurst; H. B. Simpson, London; F. J. White, Ealing. **Surveying**: Prize, F. G. Helsby, Watford. Certificates, 2, eq. K. F. Enhou, Pekin; W. A. Erlebach, London; C. D. Sharp, Norwood. 5: T. C. Linpao, Pekin. **Second Class**: L. W. Atcherley, London; L. W. Colman, Burgess Hill; W. G. Cooper, Finchley; R. E. Golden, London; F. J. White, Ealing. **Third Class**: C. B. Chabot, Selhurst. **Vacation Surveying Class (special certificates)**: H. R. Andoe, Guildford; J. H. P. Bradford, Martock; V. H. Chabot, Selhurst; A. C. Clifford, London; J. W. Huelin, Jersey; K. T. Lomas, London; H. H. Norsworthy, London; H. E. Parker, Harrow Weald.

**Municipal Engineering**, Professor Osbert Chadwick, C.M.G.—Certificates, 1: H. E. Parker, Harrow Weald. 2: H. Gana, Chilli. **Second Class**: J. H. P. Bradford, Martock. **Third Class**: V. H. Chabot, Selhurst; K. T. Lomas, London; N. E. M. Roxby, London.

## TESSERÆ.

## The Harmonies of Analogy in Painting.

WE know that the more pictures address the eye by numerous contrasts the more difficulty the spectator experiences in fixing his attention, especially if the colours are pure, varied and skilfully distributed upon the canvas. A result of this state of things, then, is that these colours being much more vivid than the flesh tints, the painter who wishes that his idea should be found in the expression of his figures, and who, putting this part of his art above the others, is convinced otherwise that the eyes of most people, ignorant of the art of seeing, being carried away by what they see at first, are incapable of returning from this impression to receive another—the painter who knows all these things, and is conscious of his power, will be restrained in the use of harmonies of contrast and prodigal of the harmonies of analogy. But he will not

derive advantage from these harmonies, especially if he selects a scene occupying a vast space filled with human figures, as in the *Last Judgment* of Michel Angelo, unless he avoids confusion by means of correct drawing, by a distribution of the figures in groups skilfully distributed over the canvas, so that they cover it almost equally, yet without presenting a cold symmetry. The eye of the spectator must embrace all these groups easily and seize the respective positions; lastly, in penetrating one of them he must find a diversity which will entice him to extend this examination to other groups. The painter who misses the effect of the physiognomies in having recourse to the harmonies of analogy will not have the same advantage in fixing the attention of the multitude as the painter who has employed the harmonies of contrast.

## Heraldic Devices.

As early as the twelfth century King Henry II. caused certain devices to be painted, which had a descriptive reference to his name—the *planta-genista*, or broom-sprig, and a jet passing between two broom-plants, the former of which is engraved upon the great seal of his son, Richard I., on either side of the throne. For many succeeding centuries these devices appear to have been confined to the royal use, but from the reign of Richard II. various houses of the nobility adopted their use. Thomas Mowbray, Duke of Norfolk, appeared against Henry, Duke of Hereford, in the celebrated joust at Coventry, upon a horse whose velvet trappings were embroidered with lions and mulberry trees, intended to typify his name. The devices of greatest notoriety were the white and red roses by which the contending families of the royal stem are still metaphorically described. From the close of the fifteenth to the middle of the sixteenth century the friezes, entablatures and stained windows of the more sumptuous habitations were crowded with devices. The Bourchier and Stafford knots were of this description. Camden, in his "Remains," has a section entitled "Rebus, or Name-Devices;" these were probably adopted in imitation of the emblems which, during the Neapolitan wars of the fifteenth century, were painted by the Italian chiefs upon their shields, accompanied by mottoes or quotations descriptive of enterprise, or of the general character of the bearer. Such were called *Impresses*, from the Italian word "*Impresa*."

## The Finding of the "Laocoon."

One day in 1506 it was announced in Rome that some workmen had discovered in the environs of the Seven Saloons a marble group of admirable beauty from the Greek chisel. At this news the artists and amateurs hastened to the garden of Titus, where they identified the "Laocoon," such as Pliny described it. Enthusiasm was at its height; in the evening all the church bells rang to announce the happy discovery. The poets did not sleep that night; they prepared to salute the return of the ancient *chef d'œuvre* to light with sonnets, hymns and canzonets; the next day there was a general fête in Rome. The statue, ornamented with flowers and evergreens, was paraded through the streets to the sound of music; priests formed the line through which it went, and uncovered their heads as it passed; the streets were crowded with people, and they accompanied with songs of joy the triumphal entry of the "Laocoon" to the Capitol. The statue being placed on its pedestal, Julius II. retired to his apartment, when a new fête commenced, in which the Cardinal Sadolet, his head crowned with ivy, chanted the happy event in an ode which all humanists know by heart. In the evening Sadolet found in his chamber a beautiful manuscript of Plato; it was a present from the Pope. As to Felix de Fredis, who discovered the precious statue in his vineyard, the Sovereign Pontiff gave him a portion of the revenues arising from the tax upon salt at the gate of St. John Lateran, and subsequently appointed him notary apostolic.

## Charles Christian Reisen.

The celebrated engraver of seals was son of Christian Reisen, of Drontheim, in Norway, who had followed the same profession, and who with one Stykes were the first artists of that kind who had distinguished themselves in England. The father died here, leaving a widow and a numerous family. The eldest was Charles Christian, who, though scarce twenty, had made so rapid a progress under his father's instructions, that he became the support of the family, and in a few years equalled any modern that had attempted the art of intaglia. He was born in the parish of St. Clement Danes, and on account of his extraction was recommended to Prince George, but being little versed in the language of his family, does not appear to have been particularly encouraged by his royal highness. The force of his genius, however, attracted the notice of Robert, Earl of Oxford, whose munificence and recommendation soon placed Christian (by which name he is best known) on the basis of fortune and fame. In the library and museum of that noble collector he found all the helps that a very deficient education had deprived him of; there he learned to see with Grecian and Roman eyes, and to produce heads after the antique worthy of his models; for, though greatly employed

on cutting arms and crests and such tasteless fantasies, his excellence lay in imitating the heroes and empresses of antiquity. The magic of those works, in which by the help of glasses we discover all the beauties of statuary and drawing, and even the science of anatomy, has been restricted to an age that was ignorant of microscopic glasses, a problem hitherto unresolved to satisfaction. Christian's fame spread beyond the confines of our island, and he received frequent commissions from Denmark, Germany and France. As his fortune and taste improved he made a collection himself of medals, prints, drawings and books, and was chosen director of the academy under Sir Godfrey Kneller. On the trial of Bishop Atterbury, on a question relating to the impression of a seal, he was thought the best judge, and was examined accordingly. Vertue represents him as a man of a jovial and free, and even sarcastic temper, and of much humour, an instance of which was that being illiterate, but conversing with men of various countries, he had composed a dialect so droll and diverting that it grew into a kind of use among his acquaintance, and he threatened to publish a dictionary of it. This great artist lived chiefly in the neighbourhood of Covent Garden. He died there of the gout, December 15, 1725, when he had not passed the forty-sixth year of his age, and was buried in the churchyard on the north side, next to the steps. He appointed his friend, Sir James Thornhill, one of his executors.

### Unrepresentative Character of Architecture.

Although architecture expresses in its way the aspect of natural things, one must not believe that it is a simple imitation of nature. There is never in art, properly speaking, the complex imitation of any whole whatsoever, but only parts that genius borrows from the reality, and that in employing them as irregular and imperfect materials, deprived by themselves of every æsthetic value, they unite, they harmonise, they arrange according to an ideal model which has a distant resemblance with the external objects, without reproducing them completely. The architectonical eurythmy is the copy, as it were, of a type which is not to be found out of us, not even in an imperfect manner. Architecture differs in this respect from painting, from sculpture and from poetry, and, so to speak, has music only for its companion. The architecture of the East, with its horizontal areas and its vertical lines of vast extent, its elevated ceilings, its specious cupolas suspended in the air, its pyramids, its obelisks, its minarets, its peristyles, its arches, its pylonas or pillars, its hypostyle halls and a float of sphinxes, its sanctuaries, its labyrinths, its hypogeums and its other works represent in a certain manner the terrestrial and maritime horizon, the celestial space, the immense masses and elevated peaks of mountains, the ancient forests, the majestic and woody alleys and walks, the vaults and subterranean places, the caverns and the other grandeurs of nature. But between the natural sublimities and the artificial sublimities there is a simple analogy, and not that perfect resemblance which is the end of imitation.

### James Christopher le Blon.

He was an inventor in an age which, however, has not been allotted any eminent rank in the history of arts. He was a Fleming of surprising vivacity and volubility, a universal projector, and with at least one of the qualities that attend that vocation, either a dupe or a cheat; probably the former, though as most of his projects ended in the air the sufferers believed the latter. As he was much an enthusiast, perhaps like most enthusiasts he was both one and the other. He discovered a method of giving colour to mezzotint, and perfected many large pictures, which may be allowed to be very tolerable copies of the best masters. Thus far his visions were realised. He distributed them by a kind of lottery, but the subscribers did not find their prizes much valued. Yet surely the art was worth improving, at least in a country so fond of portraits. Le Blon's method of mezzotint at least adds the resemblance of colour. He had another merit with which few inventors begin. He communicated his secret in a thin quarto in French and English, entitled "Coloritto: or the harmony of colouring in painting, reduced to mechanical practice under easy precepts and infallible rules." In the preface he says that he was executing anatomic figures for Monsieur St. André. Some heads coloured progressively, according to several gradations, bear witness to the success and beauty of his invention. In 1732 he published a treatise on Ideal Beauty, or Le Beau Idéal. It was translated from the original French of Lambert Hermanson Ten Kate. He afterwards set up a project for copying Raphael's cartoons in tapestry, and made some very fine drawings for that purpose. Houses were built and looms erected in the Mulberry Ground at Chelsea; but either the expense was precipitated too fast or contributions did not arrive fast enough; the bubble burst, several suffered and Le Blon was heard of no more. It is said he died in an hospital in Paris in 1740.

### Floors in Church Towers.

There is a part of our antiquities which seems to have escaped general observation, that is, the interiors of great or central towers to churches. This circumstance does not proceed altogether from neglect, but from such interiors being shut out from view by means of ceilings being thrown over from the four great arches usually supporting such towers. The use of the ceiling has no other end than to accommodate a set of bell-ringers, who, probably from a supposed benefit to their recreation, always choose to be as far as possible from the upper storey containing the bells. This method of hiding the ascending flights of storeys within the interior of towers appears to have been first resorted to temp. Henry VI. and VII., as many fine groined coverings or ceilings were then set up, as at Canterbury, Gloucester and Wells Cathedrals, &c. These interiors no doubt were formerly intended to have the same effect on the uplifted eyes as domes in Roman architecture, yet with this difference: the former display served by their upright and vanishing lines, their aerial perspective to lose the termination of each design in regions of geometrical refulgence; while the latter appearances revealed all their properties at one view, keeping a sort of middle way and confining by the continued line of a circle the eye to familiar forms and readily conceived construction. Take the storeys of a tower as they rise; each tier soon becomes, from the variety of perpendiculars, a continued and interesting attraction to the mind in its deepest research, affording at the same time almost incomprehensible speculation to modern architects how and which way such majestic elevations were brought to that standard of perfection we now behold.

### Chinese Gateways.

The plan of constructing the gateways of Chinese cities is subject to very little variation throughout the country. This consists of a semicircular projection from the face of the wall, in the side of which, though often found in the front, there is an arched gateway leading into a small enclosure, beyond which is an inner arched gateway leading into the city. The whole of this structure, which is in keeping with the wall, is devoid of all architectural display, being formed of plain grey brickwork on the outer face and margined above with embrasures placed at regular intervals. The only breaks in the long line of straight wall—sometimes in a very ordinary city three miles in length—are these gateways, and projecting square bastions situated at intervals of about 80 yards to serve as flanking defences. The wall itself varies from 1½ to 2½ feet in thickness at the top, and is somewhat thicker near the foundation. There is a bank of earth thrown up behind this wall to serve as a banquette, &c. The masonry of the city walls is formed of the largest-sized bricks. At about 20 yards in front of the wall there is a moat, 40 yards wide, crossed by bridges in front of each gateway.

### The Academy of Bologna.

No school is more celebrated than the private academy of the Carracci at Bologna, and although Lodovico Carracci endeavoured to procure a papal brief from Clement VIII. in 1599 for the establishment of an academy on the plan of the Academy of St. Luke at Rome, it was not till 1712 that a public academy of the arts was established at Bologna. Count Francesco Ghisiglieri established an academy in which there was a living model school in 1686, under the direction of Bolognini, Malvasia, E. Taruffi and L. Pasinelli. Still it did not continue many years. Lodovico Carracci accomplished the separation of the painters from the artisans, with whom they were united in the common guild, and had he lived a few years longer he probably would have accomplished also the establishment of an academy. Clement XI. granted the brief (*Breve*) for the foundation of the Bolognese academy, whence its name Accademia Clementina. Its actual founder was the General Count Marsigli, and its first meetings were in his palace. It was dedicated to Santa Catarina Bigri; the number of academicians was limited to forty, and Carlo Cignani was its first president. The academy building was originally the Palazzo Poggi, which was purchased by the Senate in 1712 for a national institute, of which the academy of the arts is a part. It has a good collection of casts, which was presented by Benedict XIV., and a very valuable gallery of pictures, for which it is chiefly indebted to Pius VII. The present Pinacoteca, which contains them, is an addition to the old edifice, by Leandro Marconi, since the peace of 1815, by order of Pius VII. The academy of the Carracci was only a private school, and ceased at the death of Lodovico in 1619, yet it was of such popularity and extent that all other private schools in Bologna suspended their functions of necessity, as they had no pupils. The Carracci called their school L'Accademia de' Desiderosi, the academy of the desirous, chose *Contentione perfectus*, By competition perfected, for a motto; and they and their scholars termed themselves gl'Incaminati, or gl'Incaminati Accademici, which means, literally, the started, or the pioneers; in this case, to excellence.

PAINTERS' ARCHITECTURE: NICOLAS POUSSIN.

### NOTES AND COMMENTS.

It may sound remarkable that the aid of Her late Majesty Queen VICTORIA should have been implored to save the Campanile at Venice. But when we learn of the despairing efforts of Signor VENDRASCO, the architect, to preserve the structure whose ruin in his eyes was impending, there is nothing extraordinary but rather characteristic of him when having failed with Ministers he appealed to Queen MARGUERITE and to Queen VICTORIA. His letter to the latter was regarded as an offence in the official world, for communication with other States is a privilege confined to a Foreign Office. That was in 1878. Twenty years afterwards the irrepressible architect had to pay for his exhaustless enthusiasm, which annoyed the officials, by being transferred from Venice to Cagliari, and because he did not arrive at his journey's end by the appointed hour he lost his office. The want of punctuality was, of course, only an ostensible reason, his offence being his unconquerable anxiety for the security of the Campanile. We must not blame the Italian officials too severely. There are few countries where men like Signor VENDRASCO are welcome visitors to Government departments.

An important point in an arbitration has been confirmed by a judgment of Mr. Justice BINGHAM. The result, however, will mean the payment by the Manchester Corporation of 496,068*l.* instead of 229,353*l.* The case related to the purchase of the property of the Manchester Carriage and Tramways Company. Some of the company's tramways were held on lease from the Corporation, but there were other lines in the city and suburbs of which they were the owners. The whole were worked as one system. On the expiration of the lease the Corporation refused to renew it, and served notice that the company should sell the parts they owned within the city. The suburban authorities similarly served notices. The amount to be paid was left to the decision of Sir FREDERICK BRAMWELL, C.E., who was to "fix one sum as the value of all the tramways undertaking and to apportion such sum among the purchasing authorities, and to decide what property and things other than the permanent way of the tramways should be transferred to the respective purchasing authorities, apportioning the purchasing authorities' proportion of the properties." At the outset an important obstacle arose; that was whether the cost of the depôts and the plant should be apportioned in such a way as to correspond with the parts of the systems which were held on lease and the parts which the company owned. In other words, the Corporation appeared to consider that an important part of the depôts and plant should be dealt with in the same manner as the leased tramways and become their property. Sir FREDERICK BRAMWELL found as a question of fact that all the depôts and plant were suitable to and used for every part of the system. He therefore found that the company were entitled to be paid 496,068*l.* But he made an alternative award by which the amount was reduced to 229,353*l.* Mr. Justice BINGHAM decided that it would be a mistake in the circumstances of this case to

say that because the property in question was suitable to and used for the purposes of the leased lines, it therefore could not be said to be suitable to and used for the purpose of the undertaking to be acquired under the award. Judgment was accordingly given in favour of the company for the larger amount.

THE advantage of a discussion about the plans for the new Government offices when the arrangements for their execution may be taken as completed is not evident, but we suppose Parliament would fail in its purpose unless opportunities were afforded for tardy criticism. The speeches on Tuesday had, however, the effect of enabling the First Commissioner of Works to make a statement which must have caused some surprise. Mr. AKERS DOUGLAS said that in his action respecting the utilising of the late Mr. BRYDON's drawings the saving of expense was not his main object, and that he was perfectly ready to spend all the money if he thought good work could be done with it. In order to secure to the House that the plans which they had approved of should be carried out in their integrity and without any change, directly he received them from Mr. BRYDON's executors he had them stamped and countersigned by the President of the Institute of British Architects; and, if the House desired it, the plans would be deposited there and would be entirely at their disposal. Lord BALCARRES had asked him for an assurance that no variation whatever should be made in these plans. He had already given a public assurance, and he now repeated it, that no variation at all would be permitted in the external elevations, and that, where it was necessary to make slight variations in smaller matters, such as knocking two rooms into one, they should only take place when approved by the President of the Institute of British Architects and the consultative committee. This seems to have more of superstition than of reverence. Mr. BRYDON did not possess infallibility, nor could he be accepted as a divinely inspired architect. In the course of the operations he was likely to receive ideas which would improve his plans, and he would, no doubt, have asked for authority to make changes. If similar ideas were to come to those who are charged with the realisation of the plans we do not think it wise that the building should be made less convenient or less pleasing out of respect for Mr. BRYDON's memory. Under similar circumstances an ordinary client would not act like the First Commissioner of Works, and in the public interest he should have displayed more courage in departing from drawings which, in the opinion of some of Mr. BRYDON's friends, are immature performances, or, in other words, only experiments which have to be gone through in order to secure perfection.

IN this building the specialties of the Burmantofts Company have been employed, and the building owes its character to them. Through their sanitary value the materials are of importance for similar buildings where men of all classes have to be served, for the facility with which the walls can be cleansed removes the danger of contagion, and the impermeable glazed surface is a barrier to microbes.

## PANSHANGER.\*

ACCORDING to Cussans, Panshanger derives its name from having formerly been the "hangre" or meadow belonging to Paine, a common Saxon appellation. By other writers hanger is defined as a wooded slope, and Thorne associates it with a family named Hanger, who held it during part of the reign of Henry VIII.

The ancient name of this manor was Blakemere; it was bestowed by William the Conqueror upon Geoffrey de Bech, one of his followers, and is recorded in the Domesday Survey thus:—"That the land is and was worth 15s.; in King Edward's time, 40s (1042-66), and that two of King Edward's thanes hold the land and might sell it." In 1391 I find that William de Melksope had the right of free warren of Panshanger.

No further account of the descent of this manor can be traced until the reign of Henry VIII., when it formed part of the possessions of Gertrude Courtenay, Marchioness of Exeter, upon whose attainder in 1541 it came to the Crown. The Marquis of Exeter was beheaded for high treason in 1541.

no record can be found in the register of either All Saints or St. Andrew's parishes. He represented the borough in Parliament in 1695, and history records that in 1705, when he was only forty-one, he had for many years been considered as the man who spoke best in the House of Commons. He with his brother Spencer got up a company of volunteers to aid the Prince of Orange, who had just landed in England, but the Militia at Oxford very peaceably stopped and disarmed them. In the reign of Queen Anne, 1702-14, he was made Lord Keeper of the Seal of England, and in that capacity took the principal share in the important negotiations with the Scotch for an union between the two kingdoms. He was raised to the peerage by the title of Baron Cowper of Wingham, in Kent, and appointed by the Queen on May 4, 1707, Lord High Chancellor of Great Britain. He was the first to break the disgraceful custom of receiving new year's gifts, which averaged about 3,000*l.* from the officers of the Court of Chancery. He risked Court favour once by his courtesy to Richard Cromwell in 1659, with the greatness of mind that marked his character. Ordering a chair for him when the old man attended upon a trial in Westminster Hall, for this

PANSHANGER, NORTH FRONT.

Afterwards Henry VIII., in the thirty-eighth year of his reign (1547) granted it by the name of Panshanger to Nicholas Throckmorton, in fee.

By means which are not ascertained it afterwards appears to have become the property of Sir Stephen Slaney, who was Lord Mayor of London in the thirty-seventh year of Queen Elizabeth's reign (1596).

From him it descended to his son and successor Stephen, and continued in his family until it became vested in two daughters, one of whom, Mary, the wife of a gentleman named Hitchcock, bought her sister's moiety, and had issue a daughter who married a merchant of the City of London named Elwes, by whom it was sold to William, son of William, first Earl Cowper.

This nobleman sprang from an ancient family seated at Strode in Sussex in the reign of Edward IV., 1461-83. He is said to have been born in the castle at Hertford in 1664, but

civility to the ex-Protector of the Commonwealth it was expected that Earl Cowper would have been reprimanded by the Sovereign, but he received praises and thanks, and when the Tories came into power the Queen herself tried to persuade him to retain office, but he steadily refused.

There was only one serious check in the prosperity of his life, which I take from an article by Edward Rose in the *Illustrated London News*. It was caused by the trial of his brother Spencer, who in 1699 left London and rode to Hertford, being at that time a barrister on the Home Circuit. At Hertford he usually stayed at the house of a Quaker lady named Stout, but on this occasion, taking his brother's advice, he took private lodgings. Now Mrs. Stout had an only daughter, a beautiful girl, who it appears had fallen madly in love with young Mr. Cowper. He seems to have been in no way to blame, but from his portrait at Panshanger, which we have seen to-day, we judge that he must have been a very handsome fellow, with keen, dark eyes and straight nose; and Miss Sarah Stout, although knowing that he was a married man, wrote him a series of very outspoken letters declaring her

\* A paper read by Mr. Henry Virgoe before the members of the Upper Norwood Athenæum.

passion for him. Cowper had to call on the mother to pay some money he had received for her; he stayed and dined with them, and left at four o'clock, promising to return in the evening and stay all night. He did return, and heard the maidservant told to prepare his bedroom; this she did, but he did not go upstairs, and shortly afterwards the maid heard the sharp slam of the front door, a door which the whole house heard when it did shut. The maid, surprised, went downstairs, and was more surprised to find that not only had Mr. Cowper gone out, but that Miss Stout was nowhere to be seen. She told the mother, who had gone to bed some time before. Both were greatly astonished, but it seemed quite clear that Miss Stout and Cowper had gone out together, for the door had only been heard to shut once. The night passed, neither returned, and in the morning came the terrible news that Miss Stout's dead body had been found in the Priory river near the town floating among the stakes of a mill dam. Though there was no actual evidence against him, Spencer Cowper was the last person who had been seen with her, and not only was he tried for murder, but half the kingdom believed him guilty. England was divided into "Stouts" and "Cowpers," not a Tory nor a Quaker but maintained that the young Whig barrister had first ruined and then murdered the luckless girl. The judge was weak and biased also. Cowper defended himself with perfect courage and ability, but though there was no kind of proof of murder, and it was shown that the girl was a hypochondriac, it yet seemed doubtful whether a Hertford jury might not find him guilty. Luckily, he was able to prove beyond question that he was at the Globe and Dolphin inn before the clock struck eleven. The inn was at least half an hour's walk from the mill stream, and the maidservant was certain that it was a quarter to eleven or less when she heard the door slam. Only one verdict could be returned and the young barrister was acquitted. The true story is pretty clear. Spencer Cowper had told the unhappy girl when they were left alone together that he could not see her again, and shortly after he went out she had crept to the door, shut it gently after her and gone to her death in the river. Twenty-eight years after those memorable assizes Spencer Cowper himself was raised to the bench—the only judge, it is said, who had ever stood in the dock on a charge of

is to him we are indebted to-day for permission to visit the beautiful mansion and grounds of Panshanger.

As we look at Panshanger House we see a long grey building, ivy clad, with turrets and towers, with a look of home, of pleasant ease, which is seldom found in our ancient castles. It is of what may be called "the early nineteenth-century-feudal order," and is as picturesque and pleasant as the mansion of a great English family could well be, and to those of us who to-day visit it for the first time it seems to possess a charm all its own. As we enter the hall, paved with black and white, a few steps bring us to the picture gallery, which is the great treasure-house of Panshanger, and we see the picture of the Laura of Petrarch, with Petrarch's poems by her side, by Andrea del Sarto; also one of Andrea del Sarto painted by himself, and this faultless painter is the great glory of the gallery, although there are Raphaels of the highest beauty and a Fra Bartolommeo that resembles in its glowing colour a cluster of jewels. The pictures by Vandyke, Teniers, Reynolds, Lawrence, Lely, Kneller, Correggio, Rembrandt, Guercino, Salvator Rosa, G. Poussin, N. Poussin, Perugino, Bourgonne, Carlo Dolce, Velasquez, Francia, Titian, Cuyp, Rubens, Dominico Fati, Paul Veronese, Wouvermann, Annibal Carracci and Opie form a most magnificent collection, and we shall doubtless carry away with us a great feeling of pleasure that we have been privileged to see them to-day. It is impossible in my limited paper to give a full and detailed account of them; the memory of them will undoubtedly remain with us.

The collection of china is probably unsurpassed, consisting as it does of most exquisite specimens of Dresden, Sèvres, Chelsea, Crown, Derby and Indian ornaments in such abundance that we saw scarcely a chimney-piece or dressing-table upstairs or down without being filled with the choicest productions of these various schools.

Of the interior of the house which we have been shown over to-day, I have no space to particularise, but I trust one and all have been charmed and delighted with its comfort and grandeur.

The grounds, as we have seen, are beautifully laid out—the swelling lawn, the lovely flower beds, the edges of box, the monograms of the Cowpers formed by lines of box, the clusters of dark trees and wooded hills, the broad water into

PANSHANGER.

HERTINGFORDBURY CHURCH.

murder. He never failed to show the greatest humanity to men placed as he himself had been.

The first Earl Cowper died at Cole Green on October 10, 1723, and lies buried in Hertingfordbury Church. He was succeeded by his son William, the purchaser of this manor, at whose death his son, George Nassau Clavering Cowper, succeeded to the title and estates on September 18, 1764. He died at Florence on December 22, 1789, and was succeeded by his eldest son, George Augustus Clavering Cowper, who dying unmarried on February 12, 1799, the estates devolved to his next brother, Peter Leopold Lewis Francis Cowper, fifth Earl Cowper, who in the year 1801 pulled down the family mansion at Cole Green, which had been erected by the Lord Chancellor Cowper in the beginning of the eighteenth century, and built the present handsome house in the Gothic style from the designs of Atkinson in 1801.

The present earl succeeded to the title and estates in 1856. He is connected with the three great Whig names of Hertfordshire, the Cowpers, the Melbournes and the Palmerstons, and has maintained their high place among the statesmen of the Liberal party. To his long list of titles he is also Viscount Fordwich, Baron Butler of Moor Park, Baron Cowper of Wingham, Baron Dingwall in the peerage of Scotland, Baron Lucas, and a baronet and prince of the Holy Roman Empire. He was also for some time Lord-Lieutenant of Ireland, and it

which runs the little river Mimram form a perfect picture of sylvan beauty.

The old oak tree which we saw in the pleasure grounds is remarkable for the largeness of its dimensions, and for the vigour of its growth; his top is bald—"stag-headed" is the woodman's word. Some of his spreading boughs have dipped and grown into the ground like new little trees holding their parent's hand; all the great branches near the earth are enough in their bulk and length to stand for full-grown trees themselves were they placed upright in the earth. It is the size and spread of these, its mighty arms rather than its mere height, which makes Panshanger oak a wonder of greatness. By a measurement taken in the year 1719 it was found to contain 315 cubic feet of timber. By a subsequent one made by Mr. Edward Ellis, of Hertford, on May 29, 1805, by direction of the Earl, 796 cubic feet, including those branches which were sufficiently large to be considered timber. It was again measured in June 1888, and was found to contain 1,222 cubic feet. The village we are now in I find is called by the ancient authorities Hertfordingberie, not Hertingfordbury, as now. The word signifies "a passage through the river in the meads," and is of Saxon origin.

Hertingfordbury Church, which we have just visited, was originally in the great diocese of Lincoln; it afterwards passed to the See of Rochester and was transferred to St. Albans on

the creation of that bishopric. I find in the ecclesiastical taxation made by order of Pope Nicholas IV. in the twentieth year of King Edward I., A.D. 1291, that Hertingfordbury Rectory was rated at 8*l.* per annum.

In the survey made upon the dissolution of the monasteries in the twenty-sixth year of the reign of King Henry VIII., 1535, it was valued in the king's book at 12*l.* 15*s.* 2*d.* per annum.

The church dedicated to St. Mary was completely restored during 1890 and 1893 at the sole expense of Earl Cowper. It is an ancient edifice of flint and stone, dating apparently from the early part of the fifteenth century, and consists of chancel, with a chapel on the north side, nave of four bays, north aisle, south porch and an embattled western tower with spire, containing a clock and five bells, dated respectively 1706, 1750, 1823, and the last two 1656. The inscription on one of the 1656 bells is "O praise the Lord for His goodness and declare His wondrous works," and the inscription on the other is in English, but is illegible. The chapel on the north side of the chancel is the mausoleum of the Cowper family, and contains on the west side an alto-relievo in white marble by the celebrated sculptor, Roubiliac, to Spencer Cowper, who was chief justice of Chester in 1717 and a justice of the Common Pleas from October 1727 till his death December 10, 1728. The figure is in judicial robes with attendant emblematical figures. On the north side is a monument to William, second Earl Cowper, died December 1764, with a medallion portrait. On the north wall is an inscription to George Augustus Frederick, sixth Earl Cowper, died April 15, 1856. There are other memorials of this family in the church itself and in the churchyard, where are also numerous tombs of the families of Chester, Brassey and Hastings.

In the tower against the south wall is an altar tomb supporting on a slab of black marble the recumbent figures in marble of Sir William Harrington, knighted at Royston, October 14, 1615, and his lady. The figure of the knight has been mutilated, but that of his wife remains to-day as perfect as when it was erected, and is a beautiful piece of sculpture; both are in winding sheets. At the feet is a representation of their daughter in an attitude of prayer. Above on two tablets of marble is a long and eulogistic inscription of not sufficient interest to be quoted here. On the opposite side is the effigy of Annie, wife of Sir George Calvert, knighted at Hampton Court September 29, 1617, and who died in 1622. It is in white marble and is habited in a richly-embroidered dress and wearing a ruff and long mantle. Amongst other memorials to various rectors and gentlemen of the parish there is one to Sir Frederick Gore Ouseley, Bart., Mus.Doc., and under the chancel arch is a brass of the fourteenth century with an inscription in Norman French to "Phelipe et Isabel, filles a Robert de Louthe," and another to "Robert de Louthe and Johane, sa feme. Dieu de ses aimes eut mercy." The present incumbent is the Rev. Canon Burnside, M.A.

In conclusion, I have to thank both Mr. Harradence and Mr. Downes for the great assistance they have rendered me in enabling me to prepare this paper. The time at my disposal was limited, so that I trust, under the circumstances, any shortcomings will be overlooked.

Authorities consulted:—"Chauncy's History and Antiquities of Herts," "Clutterbuck's History of the County of Herts, 1821," and "Cussans's History of Herts," and the *Illustrated London News*.

The illustrations are from photographs by Mr. Henry Virgoe and Mr. Charles Wheeler.

## THE ROYAL ARCHÆOLOGICAL SOCIETY.

TO Southampton have come "from all the four winds of heaven," as the President happily put it, members of the Royal Archæological Institute of Great Britain and Ireland for the purpose of holding their annual meeting and conference.

In welcoming the members of the Institute to Southampton, says the *Hampshire Advertiser*, the Mayor said they would find Southampton the centre of a district of great interest to them all, and he was sure all the objects of interest which would be shown to them would be fully explained. For many centuries Southampton was the port of the capital of the country, and Southampton Water was the cradle of the English navy, and the scene of naval battles from the time of the Danes to the invasion of the Dutch under Van Tromp in 1666.

Sir Henry Howorth, in proposing a vote of thanks to the Mayor, said they had gathered from various parts of the country for two purposes. The first was to improve their own knowledge by studying at first hand some of the many antiquities and objects of interest which were there in this famous county. They had come also in the hope that they might arouse some interest within the county itself in its own treasures, and give an impetus to those local scholars and

antiquaries who were trying to keep alive in this part of England an interest in the history of our ancestors as represented in the ancient monuments still left us, and to take care that they were as far as possible handed on to succeeding generations as nearly intact as possible. They felt that they were specially favoured in meeting in a county so far removed from foreign influences as Hampshire was, except as regarded that particular town, a county which preserved so much of the flavour of antiquity, and which was represented at that meeting by Lord Montagu, whose family seemed rooted in the soil of Hampshire like the great oaks which looked as if they could never be removed. He could not help saying that it was their function not merely to study antiquities in the concrete form of churches and similar remains, but also to study history in its best form, as preserved in charters and original documents; and when they came to those old towns, with their corporations dating from the early Plantagenets they must feel what England owed to these towns and those who governed them, local men who really won a very large part of the liberties of the country, and working steadily without pay, secured and conserved a great deal of that which made up the life of a happy self-governed community.

Lord Montagu, on taking the chair, referred to the interest which the King had shown in antiquarian pursuits, and said he felt sure the members would wish to express their great regret at the recent serious illness of the King, their admiration of the way in which he had borne it, and their pleasure and thankfulness at his recovery. The President said that he would convey an expression of the feeling of the meeting to the King. Proceeding, Lord Montagu spoke of the previous visit which the Institute paid in 1873 to Southampton. Continuing, he said:—We are now met within the ancient walls of Southampton, Sampton or Ampton, as it is so often colloquially called by many of the inhabitants of the neighbourhood, especially in the New Forest, thus recalling its name dating from Roman times and the Roman settlement at Clausanton, the mouth of the Anton or Itchen River, at Bitterne, as we now know it. Clausentum was of course connected by Roman roads northward with Venta or Winchester, and Calleva or Silchester, all "castras" or camps of the Roman colonisation and conquest, and no doubt with Porchester ("Portus Magnus"), that splendid castle which we hope to visit in Portsmouth Harbour, and so eastwards on to Chichester. When we see the stately beauty of what remains of the ancient walls of Southampton, mostly of the twelfth century, we feel how much we could desire to see them more free from the disfiguring buildings erected against them, in which some of their most beautiful features are actually incorporated. It is to be feared that the new line of railway along the western shore, which has received the sanction of Parliament, will spoil the view here obtained of the old Edwardian walls. Southampton, I regret to say, cannot be altogether complimented on the treatment of its ancient monuments. The beautiful Bar Gate, which at one time was threatened with destruction, is disfigured by the line of electric trams being taken through it, and the recent erection of a disagreeable building at the end of the High Street, on the site of the old Water Gate, spoils the view of the river and quays. At the same time, private munificence has rescued "King John's House," and there is a part of "Canute's Palace" still remaining and some parts of other old houses, which it is intended we should visit to-day. Such visits have undoubtedly a favourable effect on public opinion, creating interest and support for the preservation of remnants of former ages. At Winchester you will see some splendid old walls also of the twelfth century, some portions even of older date, and when we visit that most interesting and ancient city, the cradle of Christianity as well as of the Constitutional monarchy under which the British Empire has reached its present greatness, let us remember that the principles of government which were laid down by King Alfred are the foundations upon which the British Constitution have been reared. The attempt now to describe in any detail the wonderful objects of interest in the city of Winchester would be impossible. I am glad to see that two days of the session are to be devoted to them. The cathedral alone would occupy a whole day to do it justice, its history dating from the year 643, its bishopric seventeen years later. There are the remains of the castle, and the splendid hall, now called the County Hall, of which I understand Mr. William W. Portal is going to give us an account when we visit Winchester to-morrow, and no one is better qualified to tell us all about this most interesting and beautiful monument of former times. Another object of unfailing interest is the Hospital of St. Cross with its almost perfect Norman church, its two foundations of the Brethren of St. Cross in 1132 by Bishop Henry de Blois, and that of Cardinal Beaufort, the Brethren of Noble Poverty. One of the honours I esteem most is having been a trustee of St. Cross for a great many years and seen the revival of the foundation of the Brethren of Noble Poverty. I am glad to see that a visit is to be paid to the ancient College of Winchester and its lovely cloisters, as well as to the Castle of

Wolsey, of which it is to be regretted so little remains, to which we are invited by the Mayor of Winchester and the President of the Hampshire Field Club. I fear time may not permit of a visit to what remains of the Abbey of Hyde, with which the memory of King Alfred is so intimately connected. The neighbourhood is rich in monastic remains. Of some the churches still happily remain and are still used for Divine worship, such as Romsey, the Benedictine foundation dating from 907, the Collegiate Church of Christchurch, of the time of Edward the Confessor, while those of the abbeys of Beaulieu, and its fair daughter Netley, are in ruins. The visit to Romsey cannot fail to be of great interest, especially as the late discoveries of the foundations of an older church have been made, and will be explained to us. While we hope to see the remains of the Priory of Titchfield, 1231, and the house called "Place House," 1539, built upon the site, and incorporating a portion of the church, by Sir Thomas Wriothesley, first Earl of Southampton, time will, I fear, not permit a visit to the remains of the abbey of Southwick, also a priory of the Austin Canons, founded at Porchester in 1133, and removed to Southwick when Porchester became a royal castle, nor can we hope to reach the beautiful abbey church of Christchurch. I am glad to observe that a visit is proposed to the ancient and unused episcopal palace, built by Henry de Blois, at Bishop's Waltham, which was largely rebuilt by William of Wykeham. There are also other objects of interest in that neighbourhood. Some small opportunity will be given to members to have a glimpse of one of the most interesting monuments of ancient days, now unique, namely, the New Forest, the last remaining royal forest, curiously enough the last royal forest to be made, and therefore called the New Forest, and the last one remaining, all the rest of the royal forests having been disafforested. It is of great interest to archaeologists, as well as to the British public, whose enjoyment of it for recreation is dependent on its remaining open and enclosed, except such portions as are allotted to the growth of timber. This, with the free exercise of the rights of common and the preservation of the ancient and ornamental woods, are now secured by Act of Parliament. There is much still which may repay more methodical study in this beautiful area. The fosses require to be traced, and they seem to indicate a careful plan of defence by the ancient Britons, whose cremated remains are to be found in the tumuli which appear on most of the large open heaths on the high ground. I have felt that my position here to-day is only that of one who desires, like most of you, to obtain by means of this meeting of the Institute a better knowledge of the objects of interest which surround us, and for which we shall be indebted to those gentlemen who are good enough to give us the benefit of that careful research which they have been engaged in. Amongst them I must mention the Hampshire Field Club and Archaeological Society, and those excellent officers of this Society and others associated with it. To mention any in particular might seem to court criticism; the names of Mr. Shore, Mr. Minns and Mr. Dale, naturally suggest themselves to our grateful notice. The thanks of the members of the Institute, of which our valued friend, Sir Henry Howorth, is the able president, will be due to those gentlemen who have undertaken to enlighten us from the valuable store of knowledge they possess, and I hope that they will awaken a greater interest in the local as well as the general public of this great county and neighbourhood for the preservation of the priceless monuments of antiquity, and so help to preserve them for future generations.

Judge Baylis, in proposing a vote of thanks to Lord Montagu, mentioned the fact that in some of the old books reference was made to the vineyards of Hampshire.

Lord Montagu said he was pretty sure that the monks of Beaulieu Abbey used to make wine, and some fields in the vicinity were still called the "vineyards."

A resolution expressing sympathy with the city of Venice and the Italian people in the loss which had been occasioned by the fall of the Campanile, and conveying an intimation that the Society would contribute towards its erection, was carried unanimously, and the meeting terminated.

Afterwards the members visited St. Michael's Church and the Bar Gate, at which latter place the Rev. G. W. Minns, Mr. W. Dale and Mr. R. M. D. Lucas gave an account of the town walls and ancient buildings of Southampton. A tour of the town was then made to see the twelfth-century cross church (St. Michael's), the fourteenth-century vault in Simnel Street, King John's House, the West Gate and Guard House, Canute's Palace, God's House and God's House Gate.

On the second day the members of the Society assembled at the South-Western hotel, where Mr. Green delivered a lecture on "Clausentum," and Mr. Dale, Southampton, exhibited a number of interesting antiquities found in and about Southampton. The Dean of Winchester (Dr. Stephens) presided, and remarked that he esteemed it a great privilege to preside at that meeting, and thus to be among the first to welcome the members of the Society to West Saxon soil. He thought that on the eve, they trusted, of the coronation of

another King of our long line of monarchs there was a certain appropriateness in the Institute meeting in this part of the country, which might be called the cradle of England, and if of England, then of the British Empire. Wessex grew into England, England into Great Britain, Great Britain into the United Kingdom, and United Kingdom into the British Empire. If Wessex was the cradle of England, then Southampton was the cradle of Wessex. It was difficult, perhaps impossible, to determine why this place "Hampton" should have given its name to the county or shire of "Southampton." They knew that most of the other divisions, counties or shires of the West Saxon kingdoms took their names from tribal divisions or old principalities. They might have expected, perhaps, that where the West Saxons made their first settlement should have borne the name of Wessex or Winchester, the royal city, but such was not the case, and the only explanation of the county being called "Southampton" was that the West Saxons had a peculiar affection for "Hampton," the original settlement. Continuing, the Dean said he thought the Institute had done right in making Southampton their starting-point, for it was the starting-point of all the invaders into Wessex from the earliest times. He hoped their invasion would prove very profitable, and that they would carry away rich spoil, additional knowledge and pleasant reminiscences.

Mr. Green then read his paper, and at the outset said that some of the members who had been accustomed to regard Southampton as a wooden town might have been astonished to find how much history attached to the place. In the course of his remarks Mr. Green observed that Clausentum showed no sign of military character, not much even of a civilian residential occupation; it seemed to have been simply a large and well-protected commercial depôt for the export of the western produce in the way of tin and lead, whilst at Dover began the Watling Street, that great north road which seemed to speak all along its route of soldiery, fighting and trouble. At Clausentum began the Ikeneld Street, leading directly to and enclosing the rich and fine districts, the vales and forests and mines of our Gloucestershire and Somersetshire, speaking only of peace and prosperity. With their minerals, agriculture and flocks, this prosperity reigned for 400 years, yet the subject of this domestic life had hitherto passed almost unnoticed. Having enlarged upon this point, Mr. Green pictured in connection with Clausentum the first Channel Squadron guarding the narrow seas and convoying and protecting all exports from this pleasant district to the great western depôt.

Sir Henry Howorth proposed a vote of thanks to Mr. Green, and in doing so said that the first time the name of Southampton occurred was in the year 825 in a charter of King Egbert.

Mr. Dale afterwards exhibited and described an excellent collection of prehistoric implements which were found in this neighbourhood, and Mr. Hudd, of Caerleon, exhibited photos of a Celtic shrine that had been discovered in South Wales.

Votes of thanks to these gentlemen brought the meeting to a close.

The members were very busy in Winchester on the third day, and many of those who assembled in the evening to hear a paper by Mr. W. H. St. J. Hope on "English Fortresses" were in consequence very much fatigued. Fortresses he divided into three classes—those built by the Danes during the second half of the ninth century, those built by the English during the first quarter of the tenth century, and those built by the Normans.

Those "wrought" by the Danes—of which Wareham, Dorset, affords an example dating back to 876—were only temporary measures of defence. They were the originals of what we now call the blockhouse system, which have been requisitioned largely in South Africa. Directors of military operations then knew what they were about—they "fortified them with the best soldiers and plenty of pay." We might have completed our lesson from those early leaders with advantage. The Normans not only brought castles to England—they were the inventors of castles.

Winchester Castle, of which a view depicting it as it was about the end of the Elizabethan period was shown, dates back to 1057. The castle was built just outside the old Roman wall, apropos of which the lecturer explained that they were generally placed just outside, so that if the townspeople turned rusty, those guarding the castle retreated outside, while at other times the castles served the double purpose of dominating the town and controlling the passage of the waterway. Most interesting views illustrating how sites with those objects in view were selected were exhibited.

Southampton is, or was, a case in point. "I did not take you to the place" (at Southampton), said Mr. St. John Hope, "because all you would have seen is a Baptist chapel. The poor little tower they wantonly destroyed." Southampton has evidently gained notoriety of an unenviable kind amongst those learned in the history of the past. The entrenchments of the castles were originally topped with wooden defensive

work (a subsequent speaker drew the comparison of the ancient custom of the Romans, whose soldiers carried wooden rails as part of their equipment, and after throwing up entrenchments stuck the rails in position on the top), and the lecturer pointed out that in the case of Carisbrooke Castle one ward of the fortified enclosure never was completed by masonry, and as the result that portion was now obliterated. That had, he said, led to the fact that there had been a second court being overlooked in some quarters.

Mr. St. John Hope was cordially thanked for his excellent paper, which gave rise to animated discussion.

## COLLAPSE OF THE CAMPANILE.

THE correspondent of the *Scotsman*, in a letter dated July 19, writes:—

Having now been granted a special Ministerial permit to go inside the barricade and view the work of excavation when I choose, I spent some time amongst the ruins to-day. As the strictly guarded door opened and closed upon me, I felt a sense of sadness I had not felt before. I was alone, almost alone, amongst strangers. All my old architect friends with whom I had often talked about the Doges' Palace and St. Mark's Church, and from whom I had received valuable information, and who were unfailingly courteous and kind, had gone—collapsed like the Campanile. Last night the Ministerial Commission, under the presidency of His Excellency G. Nasi, Minister of Public Instruction, reached its first decision, which is a very serious one, and which has led to immediate serious action. Also the Prefect of Venice, the Marquis Cassis, has pronounced judgment on the "Fabbriceria," the vestry board of St. Mark's Church, which had immediate charge of the Campanile. The decisions of the Ministerial Commission run thus:—

"Considering that the 'Ufficio Regionale di Venezia' must provide for the grave and urgent necessity of preserving its numerous and celebrated monuments, recognising, further, the need of giving to the Direction all the power it requires for its grave task, avoiding all conflicting interests and uncertainties of responsibility decrees.—Art. 1. The Direction of the Ufficio Regionale for the monuments of Venice is entrusted temporarily to the architect, Commendatore Giacomo Boni, who is already invested with extraordinary powers for work upon the Campanile of St. Mark's.—Art. 2. And Commendatore Boni is invested with power to propose such substitutions and such augmentation of functionaries that he deems opportune for the carrying out of his mission."

In accordance with these decrees, Commendatore Berchet, the head architect of the office for public monuments, which has its seat in the Doge's Palace, delivered up the keys of his office and all his documents to Commendatore Boni. The architect Rupolo, who superintended the work of cutting into the Campanile about Sansovino's Loggetta, and so caused the collapse, was the architect Berchet's lieutenant.

As I have already said in a previous article, St. Mark's Church and the Campanile were under the care of the Fabbriceria of St. Mark's Church—that is, its vestry board—on which sat the patriarch, some canons and some lay members, and whose architect was Signor P. Saccardo. By command of the Prefect of Venice, the Marquis Cassis, this has been dissolved. The decree runs thus:—

"The Prefect, learning that the vestry board of St. Mark's Church, to which was entrusted the custody and the preservation of the edifice, although it had since several days been warned of the damage, and were aware of its gravity, yet gave no notice whatever of it to the rightful authorities until the last moment, exposing thus to grave peril the safety of the people, and increasing the peril of damage to objects of art, and realising the necessity of providing for the supreme interests of public safety, and for the preservation of St. Mark's Church in a worthy manner, has dissolved the Fabbriceria, and has temporarily suspended from his functions the architect, Sig. Saccardo, nominating as Commissioner Extraordinary Cav. Michael Spiriti, of the Prepelina. This decree is accompanied by a report of His Excellency the Minister of Public Instruction."

To return to the ruins. The debris has been cleared entirely away from St. Mark's Church. The church has sustained marvellously little damage. Round the base of the church there is a panelling of marble that is about 20 inches high and 20 inches broad; it forms a sort of low seat or ledge. This has been chipped more or less all the way from the main door to the south-west angle, and in places, as it is hollow, has been driven in. The angle itself, which was buried in debris, is only slightly broken. As the materials of the tower are not only precious in themselves, but are expected to throw light on the nature and epoch of its erection, they are being carefully sifted out into distinct heaps. For example, a quantity of Aquileian bricks entered into the Campanile. These are of different forms and sizes, some small, others long and thick,

and others square, measuring 16 inches across, like flags for paving. It is sad to see the beautifully carved capitals split and broken and marble columns broken in pieces. Still, it is wonderful how some things have been preserved. The statue of Mercury has been recovered with but an arm broken and some fingers of the other hand. The library portion of the Royal Palace is much more damaged than I thought it was. Under the arcade on the Piazzetta side are shipping offices. Five of these are involved more or less in the ruins. The vaulted roof, too, is cracked and shattered in places. As the columns here are broken, and are only held up because buried in ruins, the palace must be well shored up before excavations at this part can begin.

The workmen, with one or two exceptions, are all soldiers. They are dressed in white clothes and wear big straw hats, for the sun is scorching at present. Soldiers have been employed as they are good workmen, and also to prevent any stealing.

Already about two million francs have been received, and the third million required will soon be forthcoming. It is believed that the foundations are intact, only as they were intended to carry a comparatively shorter and lighter campanile than that which has collapsed, they will be enlarged, if not renewed, and this may cost half a million francs more. A question about the stability of the Doges' Palace is being raised. What about the removal of the Marciano Library, the weight of the books of which is dragging the palace down? It is two years since the Chamber of Commerce left the Zecco, so as to leave it clear to receive the books, and yet nothing has been done. I believe a contract, however, has been signed last week, and that the architect Boni, who is a Venetian, though till now labouring in the Roman Forum, and who is in accord with Luigi Vendrasco, will see that no unnecessary delay takes place. Our Prefect, too, the Marquis Cassis, is young, able and active.

A correspondent of the *Globe*, writing on July 21, says:—We have learned much during these few days since the great catastrophe of the carelessness and culpable negligence of everyone concerned—from the young architect to the Ministers of the Crown, who, year after year, turned a deaf ear to the remonstrances of Signor Vendrasco and a few others; and much discussion has taken place as to whether the Campanile should or should not be rebuilt, and, if rebuilt, on what site. But to-day comes another simply stupendous revelation, and that is that, should they decide to rebuild it, absolutely no plans, nor designs, nor architectural drawings, nor measurement of the Campanile exist anywhere by which it can be rebuilt. During all these last twenty years that it has been known to be in a perilous condition no one troubled themselves to copy anything nor to measure anything; no one even knows its exact height. No one made the roughest measurements nor the merest sketch. This astonishing fact has come out, because Signor Nasi—the only man in authority blameless as regards the destruction of the Campanile, as he only came into office the other day—made first a clean sweep out of all the officials in the Ufficio Regionale for the Conservation of Monuments, and took possession of their papers, and then proceeded to do the same with the Fabbriceria of St. Mark's, the vestry or committee charged with the care of the basilica and its treasures, and this he has done coolly and mercilessly, although the very Patriarch of Venice, the Archbishop Sarto, was its president. Here, too, all the papers were seized, and here, as at the other office, was discovered this complete absence of anything whatever in the shape of plans and drawings. Money is being poured in for the purpose of rebuilding it as it was. But how is this to be done with not even the vestige of anything to go by?

This morning as we paid our daily visit to the ruins to see what new precious fragments have been recovered, we noticed a young man among the great fragments of stone that are being collected one by one as they are disinterred from the mass of debris, with a small drawing-board, a photograph about 18 inches high of the Campanile, a slight sectional tracing, very incomplete and rudimentary, of its interior, a microscope and a pot of red paint. Being always on the look out for information, we inquired what he was doing; and after telling us the facts I have stated above, he said that he had been entrusted by Commendatore Boni, who has now entire charge of all the departments, with the task of sorting and arranging all the different blocks according to the divisions of the various courses which by means of the microscope he is able to recognise in the photograph. Then, as he identifies a stone, he marks it with his red paint and notes it down on his elevation. His work will afterwards be gone over again by others and corrected if necessary. Thus this young fellow, Signor Torres, will microscopically reconstruct the great Campanile from a photograph. It is a crying scandal that it should be so. The only help existing is the rough outline and section done a hundred years ago by an old builder named Zanotto.

We then said to him, "But Sansovino's Loggia? Of that, of course, they have every detail?" And his answer was,

"Yes, but only by the merest chance, and that was because a student at the Accademia two years ago chose it for his examination studies. There are one or two of Sansovino's original sketches, but not exactly as they were ultimately carried out." Such a state of things seems incredible; but there is young Torres with his microscope, working patiently away every day at each new block as it is added to the heap around him to testify to the truth of what I say.

Signor Boni, with his vast experience of excavating at Rome for precious things, has a splendid little army working under him. Literally an army, for the work of clearing away the huge pile of ruins is done by a company of soldiers with their officers, intermixed with a few of the more trustworthy workmen belonging to the basilica. They are as careful as they are energetic, and it is a marvel to know that from the masses already turned over of the refuse of those 18,000 tons of material they have recovered two of the four fingers that are missing from Sansovino's small figure of Mercury (found on Wednesday) that ornamented, with three others, the façade of the Loggia. The men work with a will under the fierce sun-striking heat of the morning, which is almost unbearable, even in their light clothes of brown holland and their big straw hats, for in such cases red tape and heavy uniforms are thrown to the winds.

We went into the lower chambers and courts of the Doges' Palace, all now closed to the public, but to which our passes, given us by the Prefect and the head architect, Signor Boni, admitted us freely, to see in what condition are the splendid bronze gates of Sansovino's Loggia. It is wonderful that, with the exception of a little bending and the breaking off of a lion, which was also at once found, they have suffered little damage. Of Sansovino's bronze statues no hope was entertained, they being small and hollow; all felt sure they would be shattered to pieces. Great was the delight, then, when that of Mercury was discovered, almost unscratched and unharmed, except for the loss of the four fingers of the upraised right hand and the little finger of the delicately drooping left one. "We mean to find that, too," said the soldiers.

Amid its sorrow and anger, Venice rejoices somewhat to-day, because the removal of material that half-covered the bell, which lies, open-mouthed to the sky, half-way up the rocky torrent, and which in my first letter I, like the rest of Venice, called the "Terzetta," turns out to be instead the "Marangona," the one whose midnight boom, sounding out in the still night, was so dear to the Venetians and to travellers alike. That is the great "Campanon," which has pealed out the victories of the Republic during so many centuries. The "Marangona" was brought from Candia in 1678, and was first rung on Ascension Day, the chief festival of Venice. It was called "Marangona" because at its tone the ship carpenters, in Venetian dialect the "marangoni," went to their work in the arsenal, and at its call they left it. At midday it sent them to their meal and rest, and at midnight all knew they could sleep in safety till morning, because the guards were changed and all were alert. The "Marangona" told the city if the home-coming fleet, which the watchman on its summit descried in the offing, was coming with broken mast and tattered sail—the sign of misfortune—or if its flags, joyously flying from their masts and their enemies' banners dragging behind them in the water, showed it was news of victory it brought. I said the "Terzetta" meant to ring again. Far better news is it that we may all hope that in a few years the great and loved "Marangona" will once more peal out the joys and knell the sorrows of the coming generations of Venice.

## HOUSES AND LEGAL HOUSES.

JUDGMENT was given on Monday in the House of Lords in the important case relating to the branch of the Westminster Bank in the Strand. It was an appeal, says the *Times*, from an order of the Court of Appeal (the Master of the Rolls and Lords Justices Stirling and Mathew), dated December 2, 1901, which dismissed with costs an order of the King's Bench Division (Justices Kennedy and Phillimore), dated May 15, 1901. The hearing below is reported in 18 *The Times Law Reports*, 133. The question was whether upon the true construction of the Inhabited House Duty Acts the appellants were to be assessed to such duty in respect of the whole of their premises in the Strand as one single hereditament, or only the third and fourth storeys were so assessable. The facts are given in Lord Macnaghten's judgment, and were, in short, that the ground floor and basement were occupied for business purposes; the ground storey communicated internally by a staircase with the basement—the only access to the basement; that the bank manager had a private door through which he could enter the bank premises from the common staircase; that there was an entrance from the street to all the storeys and a lift; that the first and the three self-contained rooms of the second storey were occupied, as lessees of the bank, by Messrs. Robbins, Billing &

Co., solicitors, and the rest of the second floor by their undertenants, Messrs. Taylor, Willcocks & Lemon, solicitors; and that the third and fourth storeys were occupied by the bank manager as his private residence. The Courts below decided in favour of the Crown. Though the question was one of inhabited house duty under 48 Geo. III, c. 55, the governing section was the 13th of the Customs and Inland Revenue Act, 1878. By subsection (1) of that section "where any house, being one property, shall be divided into and let in different tenements, and any of such tenements are occupied solely for the purposes of any trade or business or of any profession or calling by which the occupier seeks a livelihood or profit, or are unoccupied, the person chargeable as occupier of the house shall be at liberty to give notice in writing at any time during the year of assessment to the surveyor of taxes for the parish or place in which the house is situate, stating therein the facts; and after the receipt of such notice by the surveyor the Commissioners, acting in the execution of the Acts relating to the inhabited house duties, shall upon proof of the facts to their satisfaction grant relief from the amount of duty charged in the assessment so as to confine the same to the duty on the value according to which the house should in their opinion have been assessed if it had been a house comprising only the tenements other than such as are occupied as aforesaid or are unoccupied." Subsection 2, "Every house or tenement which is occupied solely for the purposes of any trade or business, or of any profession or calling by which the occupier seeks a livelihood or profit, shall be exempted from the duties by the said Commissioners upon proof of the facts to their satisfaction, and this exemption shall take effect although a servant or other person may dwell in such house or tenement for the protection thereof." The appellants relied mainly on the second subsection, and also on the Scottish appeal of *Grant v. Langston* (*The Times Law Rep.*, 1900; A.C., 383, 69 L.J., P.C., 66). That case was that of a public-house, the floor above the licensed premises being used as a private dwelling-house. There was, however, a separate entrance from the street to the upper floor, and no communication between the public-house and the dwelling above.

The Lord Chancellor, in moving that the appeal should be dismissed, said that the whole question was now covered by authority, and he was not disposed to upset the current of cases which had dealt with it. The question was, What was a house in the ordinary sense, and what were the artificial creatures called legal houses? One must accept and not criticise the work of the legislature, and it was the duty of the Court simply to construe the words of the Acts. The whole code was devised not so much on principle as for convenience of assessment, and plain and popular language was used. He would not repeat what had been so often said as to the artificial nature of the language employed from time to time in these Acts, but this case was beyond the reach of argument. The landlord—the bank—occupied part of the house, and there was internal communication between one part and the other of the building. Notwithstanding the ingenuity of Mr. Danckwerts's argument, the case was clear; the landlord did occupy part, and there was internal communication. It was a dwelling-house, and part was occupied by the bank, and there was no need to repeat the forcible reasoning of Lord Justice Mathew which he adopted.

Lord Macnaghten: I am of the same opinion, and I must say that the case seems to me to be tolerably clear. The London and Westminster Bank are the owners of a building comprising Nos. 217 to 221 Strand. That building is undoubtedly an inhabited dwelling-house within the meaning of the House Tax Act, and *prima facie* assessable to the tax. It is for those who claim exemption to make out their case. Now part of this house is occupied by the bank, part is let and occupied as solicitors' offices. It will be convenient to consider these two parts separately. As regards the bank, it occupies and uses the ground floor and basement as bank premises properly so called. Two of the upper floors they occupy as the residence of their manager. These two parts are not separate houses or tenements. They are parts of one house with an ordinary communication between them by means of a door under the control of their manager. There is no ground that I can see on which the bank can claim exemption. The bank manager is not a caretaker. The case is the ordinary case of a person using part of his house as a residence and part as his place of business. If it had not been that the part of the house between the bank premises and the manager's residence is let and used as solicitors' offices, I do not think ever would have occurred to anybody that the bank could claim exemption. Then can exemption be claimed for the part of the house which is let and used as solicitors' offices? It is admitted that exemption cannot be claimed under subsection 1 of section 13 of the Act of 1878. It has been decided that the fact that the owner occupies part of the house would be fatal to a claim under that section even if there were sufficient structural division. It is said, however, that the tax is laid upon the occupier, and that the bank is not the occupier

of the offices which they have let off for a term, and into which they have no right of entry except for certain purposes specified in the lease. That may be perfectly true, but if the bank cannot claim exemption under subsection 1 of section 13 the case seems to be met by the regulations in the Act of 18 George III. I think that the appeal must be dismissed with costs.

Lord Brampton concurred.

Lord Lindley said that there was no doubt that by the manager and caretaker the bank occupied the upper floors. He had at first some doubt as to the occupation by the solicitors, but that doubt had been removed, and he agreed that the appeal should be dismissed.

### PICTISH SCULPTURE.

IN the caves of Wemyss, on the Fife coast, there are still many valuable sculpturings in good preservation, says Mr. John Patrick in the *Scotsman*, although of late years, owing to the symbol caves being allowed to remain open, not a few of the incisions have suffered considerably by mischievous hands. Strange that these registrations of an intellectual phase of human thought of more than a thousand years ago should be at the mercy of the ignorant and the reckless, who have not only travestied, but have utterly destroyed nearly a whole ledge of ancient forms in the Eastern Symbol, or Factor's, Cave. In the darker parts of the caves there is less tampering, fortunately, with the archaic forms, and while recently in the Factor's Cave we found on a dimly-lighted ledge a large and vigorous incision not hitherto known to archaeologists. It appealed to me at once as the representation of a Viking ship, at the stern of which there is the figure of a man steering with an oar, while five other oars project from the broad, well-indentated hull, without any appearance of rowers, however. Both prow and stern have the characteristic Viking curving. The stern is especially conspicuous, and cut as if to give *éclat* to the craft. Its effectiveness is helped, too, by the way it catches the light owing to its leaning towards a deep fissure in a part of the rock.

I should not wonder if the searching eyes of Sir J. Y. Simpson saw this figure, and mistook it for a representation of "some of those anomalous serpents and monsters found on the sculptured stones, as on those of Strathmartin and Meigle." However, he also says, "Perhaps it is intended as the figure of a boat;" but he locates the sculpturing he refers to in the Doo Cave, where, as yet, I have not been able to find any incision answering to his description. From prow to stern this Viking ship incision measures about 2 feet 6 inches. The cutting Sir James noticed was, he says, "2 feet 9 inches long." Perhaps the figure would reach that length in curvature. He may have erred about the name of the cave. Indeed, he had evidently been misinformed about the name of the Factor's Cave, which he calls "Jonathan's Cave," and so it is misnamed in archaeological books.

It seems not a little unaccountable that this typical figure of a Viking ship should have been unknown to archaeologists. Until now the real character of this sculpturing has not been recognised, nor has the figure ever been illustrated in any book or magazine. Yet its incision in this cave would appear to point not only to the time when many of the chief symbols and signs were cut in the caves of Wemyss and on the Scottish sculptured stones, but to the people who designed and incised them. The Earl of Southesk, in his "Pictish Symbolism," pertinently remarks "that no existing theory regarding Pictish symbolism has better claims than that which deduces it from Scandinavia, but it cannot be denied that, to qualify it for general acceptance, this theory requires stronger confirmation than has yet been gained." It may be well, therefore, here to examine the bearings of this complex subject. Any light, no matter how weak, that may be thrown on it may give a suggestion or a reasonable explanation of the mystery.

The one thing that seems most clear about the symbols of Scandinavia and those of the Pictlands is that, although different in many of the designs, their characteristic form and their mythological import are so akin that they could only emanate from one race of men. Both Worsaae and Du Chailly agree that not only the antiquities but the Eddas and the Sagas plainly show the presence of an important race of people of Asiatic origin spreading northwards and westwards before and during the early Christian centuries. And to come near the point of view I take up, I will quote from Worsaae, where he says that it cannot for a moment be doubted that in the last period of the Bronze Age of the North a strong influence from Central Europe set in westwards through France and Britain even as far as Ireland, and, further, that "the lands round the Baltic were thickly inhabited by a warlike people possessing a religion and culture of Asiatic origin. They had secured for themselves considerable wealth in bronze and gold through war, the rearing of cattle, agriculture, seafaring and trade. They possessed a highly-developed workmanship in metals

and a remarkable sense of form, which, taken together, enabled them to modify the foreign shapes and patterns according to their own ideas."

Where can be found, one may ask, a more likely people than these to give us the modified symbolic representation of the Pictlands? Their increasing numbers at home, necessitating the acquisition of new territory, combined with their natural enterprise and their militant as well as their seafaring habits, would form ample reason for their participation in the Viking expeditions, so numerous and terrible from the seventh to the tenth centuries of our era.

So the probable explanation may be that the symbols of the North and South Pictlands owe their origin to Central Europeans—a people who were of the same race as the earlier designers of Scandinavian forms, but who on coming to new lands at a later period of symbolic ideas, designed anew a symbolic representation in accordance with the changed condition of mythological thought. These views are strongly supported by the symbols of the Pictlands, illustrations of which show how the latest European forms mingle and change in world-wide representations.

Further, if we look at the ship-tracings on the rocks of Bohuslehn and of Scania, we find that, although they differ slightly in form, their characteristics are quite vivid in this cave-sculpture of a ship. Moreover, among these very ancient rock-tracings the same ideas prevail as are recorded on the Scottish sculptured stones; the figures of men on horseback in hunting scenes, and those of a more domestic character, mingle with the mythological signs and with the struggling life of the incisors just as the symbolic designs on the rocks and stones of the Pictlands mingle with the figures of men on horseback accompanied by dogs, all in full hunting action, and with many scenes of a later phase of life—the phase of life in a new land.

It may be well to note here that the cutting of this ship-embellish has every appearance of being contemporaneous with the other chief sculpturings in Wemyss Caves, which, although primitive looking in form, clearly evince a knowledge of the newer and modified symbolism of the better executed forms on the sculptured stones. But perhaps the rudeness of the cave-tracings may be owing to the inaptitude of their incisors, who, most likely, were the commoner class of people—mere cave-dwellers, probably, possessing the same mythological faith as that of their brilliant masters and leaders. Wemyss Caves still possess many proofs that they had been long used as human habitations.

### THE MANCHESTER ROYAL INFIRMARY.

THE following "Memorandum for information of trustees" and the reply will suggest the peculiar condition in which the project for rebuilding now stands:—

When voting on the question of rebuilding it may be of use if the trustees have before them the following facts:—

1. The Board of Management have consistently endeavoured from year to year to give effect to the wishes of the trustees as expressed by a majority in public meeting assembled.
2. As regards Lord Egerton and his Newcastle argument, the gentleman who then presented a free site outside the city gave also 100,000*l.* for building purposes, and another donor subscribed a further 100,000*l.*
3. In rebuilding it is provided that no in-patients will be disturbed, but that they will be moved direct from present wards into wards in the new building as they are completed.
4. In fifteen months 200 and in twenty-four months 300 beds in the new building will be ready for use by patients.
5. The architects are prepared to meet any reasonable requirements for street widening that may be proposed by the Corporation without interfering to any important extent with the plans of the new building.

6. No sale of infirmary land can take place without the sanction of the Charity Commissioners and an Act of Parliament.

7. If the infirmary site—the Corporation having already refused to purchase it in part or in whole—is sold to the public it must be used for building purposes, in which case what becomes of the open space argument?

8. If the infirmary were divided into two parts, one on the present site and other at Stanley Grove, instead of all on one site, it has been demonstrated that the additional cost of the two establishments would amount to 3,000*l.* per annum.

A reply to this memorandum has been issued and is as follows:—

When voting on the question of rebuilding it may be of use if the trustees have before them the following facts:—

1. The Board have consistently endeavoured from year to year to frustrate the wishes of the trustees as expressed by a majority in public meeting assembled as to the site.
2. Lord Egerton cogently made a most appropriate comparison from his own experience. How do the Board know

that the Lancashire people will not be equally liberal, if in smaller sums, as the Newcastle? The Board have never in their history propounded a scheme for building elsewhere. Such schemes have always originated from outsiders, and the Board have calmly folded their arms and waited complacently for the Corporation or anybody else to find the money, so that both scheme and money must always come from others. The proposals of the Board have always been to rebuild on Piccadilly site. Do they expect anyone to offer 100,000*l.* towards that?

3. Do the Board wish to persuade the trustees that the hammering and noise of pulling down a great building and erecting a new one, plus the noise and roar inseparable from the present site, will not disturb the patients? The trustees and men of Manchester are not so foolish as to accept such a theory.

4. This is manifestly impossible. To pull down a huge building and erect another of really substantial character in fifteen months will not strike the trustees as reasonable. Even if it were possible, the building would be totally unfit to receive patients who are suffering and dying. Eminent experts have confirmed this view to-day.

5. How can "the architects meet any reasonable requirements" for street widening with a margin of only 8 yards? To run double tram lines around by George Street and Parker Street would make the new buildings actually abut on the foot-paths: Where is the theory for quiet and non-disturbance of patients?

6 Applications to the Charity Commissioners and Parliament are an everyday occurrence. No one wishes the site to be covered (except the Board), but to argue the application to the Charity Commissioners and Parliament in itself as a valid reason for putting a new infirmary on the present site only proves what a poor case the Board are able to make out.

7. It is erroneous to say the site must be sold for building purposes. Cannot it be sold in whole or in part to the public for an open space? Is this suggestion beyond the limits of the imagination of the Board?

8. A reception-house for urgent accidents on the present site need only be very small—say twenty beds. The majority of accidents from railway stations and the southern part of the town would naturally go direct to Stanley Grove in motor ambulance carriages with pneumatic tyres. Twenty beds at 50*l.* per bed for maintenance would be 1,000*l.* per annum, and even this would not be all additional expense, because the patients occupying beds in the receiving-house would be relieving beds at Stanley Grove. There could therefore only be a very small amount of overlapping. The figure of 3,000*l.* therefore seems to be utterly misleading. Even, however, if it were correct, the Board are proposing to throw away more than ten times this amount per annum in interest alone by their proposal.

N.B.—Vote against the motion.

### THE MULREADY PRIZE.

THE Council of the Society of Arts are prepared to offer, under the terms of the Mulready Trust, a gold medal or a prize of 25*l.* for competition amongst students of the schools of art in the United Kingdom, at the annual national competition to be held in 1903. The prize is offered to the student who obtains the highest awards in the following subjects:—(a) A finished drawing of imperial size from the nude living model. (b) A set of time studies on a small scale, from the nude living model, executed in a short time, of varied shortly sustained poses (mounted on not more than two imperial size mounts). (c) A set of studies of hands and feet from the living model (mounted on not more than two imperial size mounts). (d) Drawing from the life, including memory life drawing done at the examination on May 9, 1903. No student will be eligible for the award who does not pass in the examination (d) in drawing from the life, and who does not obtain an award for (a) the finished drawing of imperial size from the nude living model. The other two subjects are optional. The works must be those of the previous school year. The recipient of a prize awarded under this trust in 1892, 1893, or 1896, cannot compete again. The drawings, &c., are to be submitted, with other school works, in the usual manner to the Board of Education, South Kensington, in April, 1903. Each competing drawing must be marked "In Competition for the Mulready Prize," in addition to being labelled according to the regulations of the Board of Education.

M. Eustache, who was awarded the médaille d'honneur in the Salon for his view and restoration of the Sacred Way at Rome, has been nominated for the Legion of Honour. He obtained the Prix de Rome for architecture in 1891.

### GENERAL.

**The Jury** appointed to judge the houses constructed during 1901 in Paris includes the following architects, MM. Bouvard, Sauzet, Vaudremer and Bartaumieux.

**French Archaeologists** attach much importance to the discovery of four bronze hatchets at La Glacière, near Cherbouurg. They correspond with those which have been met with near the Swiss village Morges, and are supposed to be evidence of a connection between the two districts.

**The Great Northern and Strand Railway Company** have let a contract for the immediate construction of the line to Messrs. Walter Scott & Middleton, of Westminster.

**A Syndicate** has been formed in France for the protection of the picturesque rocks which are found on the sea-coast at Ploumanac'h, in Brittany. They have often been introduced in pictures, and it is reported that an arrangement was made to utilise them for building stones.

**The London County Council** have decided to take down the Coronation stands erected by them. After deducting all cost connected therewith, the balance will be handed to the ticket-holders, who have paid 25*s.* for a seat.

**M. Ferdinand Humbert** has been elected member of the Académie des Beaux-Arts in succession to the late M. Benjamin-Constant.

**M. Siéfert** has obtained the Prix de Rome for painting. He was a pupil of MM. Gérôme, Guay and Maignen. The Prix de Rome in sculpture was won by M. Alphonse Terroir, a pupil of M. Barrias; and in medalling by M. Victor Dautel, a pupil of MM. Barrias and Dubois.

**The Guildhall** art loan exhibition of pictures by French and English artists closed on Saturday. The exhibition has been visited by over 170,000 persons.

**The London County Council** have passed a vote of 10,933*l.* in settlement of contractor's extras in connection with the demolition of the old Vauxhall Bridge and the partial construction of the new one. This was recommended on the distinct understanding that the present contract will be completed this year, so that contracts for the superstructure of the bridge may be invited without further delay. There is likely to be a very substantial alteration in the plans for the erection of the bridge.

**The Prefect of the Seine** has approved of the project of M. Edouard Détaillé for an exhibition of sign-boards in Paris. All the official regulations have now been complied with, and the exhibition will be opened during the coming autumn.

**The Metropolitan Asylums Board** have accepted the tender of Messrs. W. Johnson & Co., Ltd., of Bellevue Road, Wandsworth Common, for the erection, at the sum of 174,750*l.*, of the Southern Hospital, in accordance with plans and specifications prepared by Messrs. Treadwell & Martin, architects.

**A Memorial** has been erected in the Market Place of Brussels to Everhard T'Serclars, who was one of the Flemish heroes of the Middle Ages, and took a principal part in the liberation of Brussels in 1356.

**The Building Act Committee** of the London County Council report that they have given instructions for the recommendations of the coroner's jury in connection with the fatal accident which occurred on July 10 at Langham Place, through the falling of a piece of coping from the parapet of All Souls Church, to be noted for consideration in connection with the general question of the amendment of the London Building Acts. The structure has been surveyed in pursuance of powers relating to dangerous structures, and arrangements are being made for the removal of the greater part, if not the whole, of the balustrades, and for replacing them in Portland stone.

**Messrs. Scamell & Colyer**, architects, have removed from 14 Victoria Street, S.W., to 41 Old Queen Street, Westminster, S.W.

**The Oxford School of Egyptologists** have been exhibiting at the Ashmolean Museum a collection of pottery and other remains, discovered during 1901-2 at Regagnah and Berkhallafin, Upper Egypt, by Mr. John Garstang, of Jesus College. Among the objects are specimens of prehistoric ware, the provisional date for which may be given as B.C. 5000; numerous remains of the third dynasty (B.C. 4000), among which are alabaster "offering tables," copper vessels, knife and spoons, and a perfectly preserved macehead of limestone carved with a delicate rope-pattern, and the head fitted with an inlaid ivory cap. Of the thirteenth dynasty the remains include a stele in remarkable preservation, with a curious shrine on the reverse side, of which some early iconoclast had defaced the figure as that of an alien deity. The eighteenth and nineteenth dynasties are represented by numerous (so-called) ushabti figures (Egyptian equivalents of the Tanagra statuettes), scarabæi, beads and other ornaments, with two pairs of gold bracelets in excellent condition.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**BERMONDSEY.**—Sept. 16.—Designs are invited for artisans dwellings to be erected on land at Rotherhithe, within the borough of Bermondsey, and known as the Fulford Street area. Premiums of 100*l.*, 60*l.* and 40*l.* will be awarded. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**BIDEFORD.**—Sept. 25.—The Town Council of Bideford are about to erect municipal offices and a public library upon a site opposite the west end of the Long Bridge, Bideford, and they invite designs for the proposed buildings. Premiums of 30*l.*, 15*l.* and 10*l.* respectively are offered for the designs which shall be placed by the Council first, second and third in order of merit. Designs and descriptions, &c., are to be delivered to Mr. Wm. B. Seldon, town clerk, 18 The Quay, Bideford.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford S.E.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria

at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**MAIDENHEAD.**—Oct. 1.—Designs for free library. Premiums offered of £50, £20 and £10 respectively. Mr. John Kirk, town clerk, Guildhall, Maidenhead.

**SOUTHEND.**—Sept. 7.—Designs are invited for a church to accommodate 500 persons, a clergy-house, and a parochial hall or parish-room about 50 feet by 30 feet. Mr. C. H. J. Talmage, Kathlene Villa, Southchurch Road, Southend-on-Sea.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

### TRADE NOTES.

THE Isolation Hospital, Ilfracombe, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues.

A LARGE clock with four 7-foot dials and striking the hours has just been erected in the new tower of the Royal Orphanage, Wolverhampton, by John Smith & Sons, Midland Clock Works, Derby.

THE Corporation of Newcastle-on-Tyne have given instructions to Messrs. Wm. Potts & Son, clock manufacturers, Town Hall Buildings, Newcastle and Leeds, to erect a clock with large external dial at the Westgate Mission church, Newcastle, which is now in hand. They have also just completed a new hour striking clock at Crakehall Church, near Bedale, to commemorate the Coronation of King Edward VII.

### ELECTRIC NOTES.

THE results of the second year's working of the electric-light undertaking of the York Corporation show a total revenue of 6,110*l*, as against a total revenue last year of 3,802*l*. The total cost of generation and management has been 3,518*l*, as against 2,276*l*, being an increase of 1,241*l*, and the gross profit is 2,591*l*, as against 1,526*l*. Interest and sinking fund this year absorb 2,242*l*, leaving a net profit of 349*l*, as against 98*l* last year.

At a meeting of the lighting committee of the Liverpool Corporation a communication from the Board of Trade was read stating that Mr. A. P. Trotter, one of their inspectors, had been directed to confer with various civil and electrical engineers with a view to revising regulations made under the electric-lighting Acts, which affect both tramways and lighting. The committee authorised Mr. Holmes, Corporation electrical engineer, to attend the conference.

### BUILDING AND BUILDERS.

MEMORIAL-STONES of a new Primitive Methodist church at Beckbridge, Normanton, were laid on the 30th ult. The building will cost 1,100*l*, and accommodate 300 persons.

THE foundation-stone has been laid of a new Wesleyan Sunday school at Whaplode, near Spalding. The building will form part of an extension scheme which will involve an outlay of 2,500*l*, and which will also include new chapels at Donington and Moulton Chapel and a manse at Spalding.

# WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

**WILSON & CO.**

24 HARRISON STREET,  
GRAY'S INN ROAD,  
LONDON. E.C.

AT a special meeting of the Birkenhead School Board a recommendation of the sites and building committee that the plans for the enlargement of the Laird Street school, including provision for cookery, laundry and manual instruction and a caretaker's house, be adopted were confirmed.

MEMORIAL-STONES of a new Wesleyan church at Romiley, near Stockport, have been laid. The site is the ground formerly occupied by the old fire-damaged chapel. The new building is estimated to cost about 2,860*l.*, and seat, with gallery, some 500 persons.

THE old Newington vestry hall, which, since the creation of the new borough of Southwark, has been used as town hall for the enlarged municipality, is to be further extended at a cost of 14,000*l.* The extension has been occasioned in consequence of the greatly augmented staff of clerks and officials which the Borough Council has introduced into the old building.

THE corner-stone of new offices for the Horbury (Yorks) Urban District Council was laid on the 30th ult. by Mr. Joshua Harrop, the chairman. The offices, including the site, &c., will cost about 6,000*l.* Mr. Harrop afterwards entertained a large number of ladies and gentlemen at a garden party, and was presented with a gold Coronation medal by his colleagues.

ON Saturday last an accident occurred at Burnfoot Bridge, about three miles above Langholm, N.B. The bridge, which is a handsome structure, is at present being reconstructed and strengthened by Sir Frederick Johnstone, Bart., of Wester Hall, and Mr. Malcolm, of Burnfoot, to whom it belongs. It crosses the river Esk near Burnfoot. An extra arch has been put in, and five centres or supports have been used, and it was while these were being removed that the accident occurred. Each centre was very massive, requiring 16 men to lift it, and weighing fully a ton. The two outside supports had been safely removed, but on taking steps to remove a third the other two came down suddenly on a platform on which six men were standing. Three of them managed to clear themselves, but the other three were struck and knocked over. Wm. Beattie was cut on the head and had his right arm broken; D. Moffat, cut about the head and injured in the back; and Jas. Kyle had his arm cut and bruised. They were conveyed to their homes in Langholm, where they received medical aid.

THE foundation-stone of the new church of St. Matthew, Renishaw, was formally laid by Dr. King, the Lord Bishop of Lincoln, on the 24th ult. The church, the contract for which has been let to Mr. James Fidler, Eckington, is estimated to

cost about 4,300*l.* The new edifice will be in the Early English style of architecture, and will be constructed to designs prepared by Messrs. Naylor & Sale, architects, Derby. Externally the church will, when completed, present an attractive appearance and be a distinct addition to the architectural features of the district. At present, however, it is only proposed to proceed with the erection of the nave, the north aisle, the base of the tower, which will be utilised as an organ-chamber, and a vestry, leaving the chancel and the completion of the tower over for future consideration. The external walls will be built with Stoke Hall stone, from Grindleford, with Cox bench-dressing inside. It will be covered with green slates and oak and timbered roof. The lighting will be by gas and the heating by hot water. Accommodation will be provided for about 400 worshippers, and it is hoped it will be ready for opening by March next.

### VARIETIES.

A NEW Roman Catholic church was opened at Astley Bridge, Bolton, on the 27th ult.

THE newly-erected chapel and Sunday school for the Primitive Methodists at Knaresborough have been completed. The premises occupy a position on the north-east side of Pump Hill, with a frontage to High Street. They are of stone, very ornamental in appearance, the cost of their erection being upwards of 3,000*l.*

A MEETING of the registration committee of the local branch of the National Registration of Plumbers was held last week at the offices, Lord Street, Liverpool, Dr. Vacher, county medical officer of health for Cheshire, presiding. A number of registration certificates were distributed to plumbers, who attended from Oswestry, St. Helens, Liverpool, Southport, Waterloo, &c. A number of other applications were deliberated upon, as well as the financial statement of the movement, from which it appeared that the Plumbers' Company had already spent a sum of 31,821*l.* in excess of receipts on the movement since its inauguration in 1884.

THE new church of St. Columba, Middlesbrough, was consecrated on the 19th ult. The edifice is the design of Mr. T. Moore, of Hampstead, and, owing to the peculiar shape of the site, it is a remarkable structure. The style is a *mélange* of Early English, Gothic and Italian. The nave consists of a

double arcade of three bays, being 88 feet long and 32 feet wide, and is covered with three immense vaults of simple Early English type, boarded throughout and finished with French grey moulded ribs, springing from pilasters on the massive piers. The carved bosses at the intersection of the ribs are gilded and coloured, being some 60 feet from the floor. The east end terminates in three lofty arches, opening into the chapel beyond, there being no chancel. Over these is an ambulatory, and above this again a group of five lancet windows deeply recessed, like all the rest. The altar is raised on seven steps in groups reaching up to the platform. The choir is retained within dwarf walls advancing into the nave, and raised above it by two steps. Beyond the pierced east wall is the small chapel for daily prayers. This has three lofty arches springing from two very slender octagonal stone pillars. It has four lancet windows on the south side and a row of small ones filled with stained glass high up at the east end. On the north side is the vestry. The edifice will be entirely lighted by electricity. The tower, which is 72 feet high, has various lancet windows, with a row of round ones under the parapet, the whole being surmounted with a high-pitched roof bearing a simple cross. The cost has been £8,800, including £1,700 for the site.

THE church of St. Mary, Far Cotton, Northampton (one of the several churches erected under the Northampton Church extension scheme originated by the late Archbishop Magee, when Bishop of Peterborough), the foundation-stone of which was laid in May 1884, and which was consecrated in October 1886, has since that time been awaiting the erection of tower and spire, to bring it into a state of completion. Some eighteen months ago the amount subscribed towards this object was sufficient to guarantee the work being proceeded with, and Mr. M. H. Holding, the architect of the church, was consulted as to the preparation of plans; and these were ultimately agreed upon. The estimated cost was about £1,200. The contract for the work was entrusted to Messrs. J. Pullen & Sons, Bridge Street. The tower, which rises to a height of about 70 feet, is of Dunston stone with Bath stone dressings and cinquefoil windows in the lower stage. Tall double lancet windows are also placed in the belfry stage. The spire, springing from the tower, is built wholly of Bath stone, and is 58 feet in height, making a total of 128 feet. At the top of the spire is an octagonal finial, and this is surmounted by a decorated rod and vane, measuring between 7 and 8 feet. The

vane is the conventional gilt cock, and running thence down the edifice a lightning conductor, going down some 12 feet into the earth, will be fixed. The finishing touch to the work was completed on Monday by the fixing of the vane on the rod which had been prepared to receive it.

H.I.M. THE GERMAN EMPEROR (according to the German *Imperial Gazette* of July 23), has graciously accorded the distinction of the Red Cross (third class) upon Mr. Edwin O. Sachs, chairman of the British Fire Prevention Committee; Major Fox, chief officer of the London Salvage Corps; Second Officer Gamble, Metropolitan Fire Brigade; and Mr. Horace Folker, hon. secretary of the National Fire Brigades Union. Similar distinctions for merit in fire-preventive and fire-brigade work have been accorded to the following foreign members of the British Fire Prevention Committee, *i.e.*, to Count Kamorowski (chairman) and M. Henry (hon. secretary), of the International Fire Council; to Messrs. Czermack and G. de Marie (presidents of the Austrian and Luxembourg Fire Federations respectively); and to Chief Officers Westphalen (Hamburg), Dittmann (Bremen), Count Fernandez (Oporto), J. Meier (Amsterdam), Colonel Goldoni (Milan), Chevalier Pappini (Florence), and Lieutenant-Colonel Meyer (Copenhagen).

THE annual conference of the Auctioneers' Institute of the United Kingdom will be held in Belfast on September 4, 5 and 6. In 1899 the conference was held in Dublin and the coming visit will be the first since then. One of the objects which the Institute has in view is the securing of a Royal Charter, and if this year's meeting is as successful as is anticipated, and meets with the support which it is hoped it will, the movement will have received a great impetus. On the opening day the Council of the Institute will be entertained at a banquet given by the local auctioneers, and on the remaining days the visitors will be shown the principal industries and places of interest in Belfast, a trip to the Giant's Causeway concluding the arrangements for the occasion. An efficient and capable committee of city auctioneers has been appointed, of which Mr. Robert M. Gray and Mr. H. H. Montgomery are the hon. secretaries. Nothing has been left undone in regard to either the business or social arrangements to make the conference a thorough success, and it is to be hoped the auctioneers of Ulster will avail themselves of the opportunity of conferring with their brethren from England and Scotland on matters which intimately concern the best interests of the profession.

MARKT & CO., 20 CHAPEL STREET, MILTON STREET, LONDON, E.C.

tenoy, No. 47.

Cluny, No. 45.

ARRANGEMENTS have been made for the Twenty-fourth Annual Ecclesiastical, Educational and Art Exhibition to be held in the Exhibition Buildings in Gold Street, Northampton, which are admirably situated for the purpose, being close to the Congress Hall. It will be open on Saturday, Oct. 4, remaining open till Friday, Oct. 10. The exhibition will be thoroughly representative of the ecclesiastical and educational furnishing trades and manufactures throughout the country, and the clergy and churchmen generally are being invited to contribute towards the loan collection, which promises to be of very great interest, several well-known collectors having kindly promised their support. The Church societies and institutions, for whom during the Congress the exhibition always forms a convenient rendezvous to meet their friends and supporters, will again be mustered in full force. The exhibits will as usual comprise metalwork, embroidery, wood and stone carvings and "articles of every description used in the services of the Church, and in the fitting, lighting, warming, ventilating and the decoration and embellishment of churches, including stained-glass windows." Space will also be provided for Church literature of all kinds, Bibles, Prayer-books, &c., and a special feature is always made of educational works and appliances. Offers of loans of Church plate, embroidery, wood and ivory carvings, paintings, old MSS. and books and articles of archaeological interest generally, should be addressed to the manager, Mr. John Hart, Maltravers House, Arundel Street, Strand, London, W.C.

### NEW THAMES TUNNEL.

THE new tunnel for pedestrians, constructed for the London County Council by Messrs. J. Cochrane & Sons at a cost of 120,000*l.*, will be opened for free public use on August Bank Holiday. For the two days previously it will be handed over to the Seamen's (Dreadnought) Hospital and the Poplar Hospital for Accidents, which will make a small charge for admission. The work has taken three years to carry out, the actual tunnelling under the river being done in eight months. At first the County Council thought to make a tunnel slightly smaller than the one at Blackwall, to carry vehicles as well as passengers, but this project was soon dropped as the Millwall docks, on the Isle of Dogs, made it impossible to construct the necessary approaches. There was little traffic, and communication

between the two banks was needed wholly in the interests of the working people of both districts. The approach on the Greenwich side is from the north end of Church Street, in the rear of the famous Ship tavern, and on the Millwall side by a footpath 15 feet wide at the western end of Island Gardens. A ferry between Greenwich and the Isle of Dogs has about 1,300,000 passengers a year. The tunnel, which is 60 feet below high-water level, is 1,217 feet long and 11 feet in diameter. It has been driven by a shield working under compressed air from the north side, and the entrance at each end is by a circular shaft 35 feet in diameter, with stairways and electric lifts. The top of the tunnel is 13 feet from the bottom of the river.

### THE QUEEN VICTORIA STREET FIRE.

THE following questions were proposed to the jury on the victims of the fire on June 9, and the following answers were returned:—

What was the cause of death?—Suffocation, burns, shock and injury, in accordance with the medical evidence.

What was the time of the fire, and where did it first break out?—Between two and three minutes to 5 o'clock, on the second floor of No. 67.

Did the private fire brigade of the General Electric Company materially contribute to the extinguishing of the fire?—No.

Were reasonable precautions taken against fire by the General Electric Company, having in view the number of electric lighting lamps and wires in use and the amount of inflammable material about the premises?—We say No.

Whether the deaths under inquiry were not due to the shortness of the fire-escape sent from Watling Street station?—Partly.

Whether Watling Street station should not have been provided with a ladder sufficiently long to reach the fourth floor window of No. 67 Queen Victoria Street?—Yes.

Whether a 60-foot ladder could not have been kept equally well in place of the one stationed near the church in the street facing Watling Street station?—Yes.

Whether a tall ladder—say, of 60 feet—should not be taken in the first place to all fires?—We are of opinion that this question be left to the discretion of the Fire Brigade officials.

Whether Watling Street station should not have been able to send an escape long enough to reach a window-sill 55 feet high?—Yes.

Was the call at Watling Street reasonably early? In other words, did the lateness of the call contribute to this lamentable loss of life?—The call was a very late one, and in our opinion contributed to the lamentable loss of life.

Was the jumping-sheet of the Metropolitan Fire Brigade actually used to catch any person who jumped from the window?—No.

Would the lives of some or all of the girls have been saved had the Watling Street escape been able to reach the fourth floor window of No. 67 Queen Victoria Street on its arrival at the fire at 5.14 P.M.?—Some might have been saved.

Are the reasons given by Captain Wells as to the four cars' delay in converting Watling Street into a first-class station satisfactory?—No.

Had Watling Street station been adequately equipped to save any lives have been lost?—We cannot tell.

Is it desirable to allow automatic fire-alarms to be in direct communication with the fire-stations in the manner approved by Sir Eyre Massey Shaw?—This is a question for the London County Council authorities to decide.

Does the City get all it has a right to expect from its Fire Brigade?—It is an impossible question for us to answer.

Do you think that the premises of the General Electric Company, Nos. 67, 69 and 71 Queen Victoria Street, constitute a workshop within the definition of the Act?—We say yes, most decidedly.

Do you think that had proper structural exits been provided on the roof or elsewhere this loss of life would have been altogether or partly prevented?—We say yes, altogether prevented.

Was the sanction given by the district surveyor, Mr. Power, for the structural changes that connected 67 to 69 in your opinion legal or otherwise, in view of the fact that the General Electric Company's occupation of No. 67 was only partial?—We say illegal.

Was there any neglect of legal or other obligations or duties on the part of the following:—(1) The General Electric Company; (2) the Metropolitan Fire Brigade; (3) any of the various officials who have given evidence; (4) any of the various authorities alluded to in the course of evidence; if any negligence has been committed, to what degree does that negligence, in your opinion, amount?—We say, with regard to

the General Electric Company there was gross legal negligence, but not criminal. With regard to the Fire Brigade, "No, considering the appliances at their disposal." (3) We say "Yes;" we consider the factory inspector failed to properly represent to the Home Office the nature of the work carried on by the General Electric Company through not making sufficient inquiry. We think the district surveyor is to blame for his interpretation of the term "wholly occupied."

Do you consider the entrance to No. 71 sufficient for the employees at 67, 69, and 71?—We say "No, it is not sufficient."

The foreman said the jury thought the cause of the fire unknown, and as to who was responsible the jury could not say. They wished, however, to add the following riders:—

(1) We consider that the Watling Street station is totally inadequate to meet the demands of the district in which it is situated, and that it should be immediately reconstructed a first-class fire station. (2) We consider that the London Building Act, 1894, should be made retrospective as regards life-saving. (3) We consider that the General Electric Company, by evading the Factory Act and misleading the district surveyor, render themselves responsible for the loss of life. (4) We give unqualified praise to the Metropolitan Fire Brigade and the Salvage Corps, and we consider that, as usual, the City police did their duty exceedingly well.

The jury added their deepest sympathy with the parents and relatives of the deceased.

### A NEW PUMP.

At the Ilford District Council electric power station experiments have been made with a new air-lift pump, the invention of Mr. Joseph Price, of the firm of Legrand & Sutcliff, and the results show that a revolution has been worked in the method of raising water from deep wells, and that in all probability the knell has been sounded of the expansion deep-well pump.

By this system a great economy is effected, as it only requires one horse-power to operate any number of wells. The new air-lift pump designed by Mr. Price brings about a considerable saving of the waste of power inherent in the design of the ordinary air-lift pump. In this pump the rising main being of equal diameter throughout its length, the water and air rise in alternate layers. The action of the air as it rises in the main can be best understood by taking an

illustration. Suppose the height to which the water must be raised is 80 feet, and the immersion of the tube is 120 feet, thus making a total length of rising main of 200 feet. The air is pumped down the rising main through a small tube at a pressure which in this case would be 60 lbs. At this pressure it will occupy about one-fifth of its original volume. This air gets blown out at the bottom of the inner air pipe amongst the water of the rising main, and as it lightens the water and rises the pressure above it will become less and less, and at the top of the well will only have the atmospheric pressure above it. If it can it will expand gradually on its way upwards, until at the top it will occupy a length of the tube several times what it was at the bottom. In order to allow of this expansion the water above the layer of air must have been caused to travel very much faster than it did at the bottom. That is to say, much of the energy of the air has been uselessly employed, giving a rapid motion to the water in the upper parts of the tube.

In order to get over this difficulty Mr. Price has introduced a tapering rising main, so that it is wider at the top. In this tube the air expands laterally, and the layers of water travel with about the same speed at the top as they do at the bottom of the rising main, and there is thus no waste of energy in creating momentum in the water. In the Ilford well the immersion is  $1\frac{1}{2}$  to 1 of lift, the lift being 130 feet. The air pipe down the centre of the rising main is  $1\frac{1}{2}$  in. diameter at the top and  $1\frac{1}{4}$  in. lower down. The air is supplied by an Alley and McLellan compressor, which on trial gave the following results:—When the air pressure in the receiver was 80 lbs. the mean indicated horse-power of the air in the cylinder was 18.83; when 100 lbs., 22 i.h.p., and when 120 lbs. it was 24.3 i.h.p. On trial with one of these air compressors directly driven with a steam-engine the loss was only 6 per cent. At Ilford the compressor is driven with a motor.

The efficiency of the system may be compared with that of the deep-well pump, as there are records of the latter. If 10 per cent. be allowed as the loss between the steam-engine and the compressor, and 20.5 i.h.p. the mean of the air in the cylinders, a comparison may be made. The supply of water is 12,000 gallons an hour, the lift 130 feet and the pressure of air 90 lbs. With these figures the efficiency works out at 35 per cent, even for the first installations. The efficiency of the deep-well pump after working some time comes down to some 40 per cent. So when the cost of repairs, maintenance and small comparative supply of water

of the deep-well pump and the number of air-lift pumps and the large supply of water from each are compared, the result stands very strongly in favour of the new air-lift pump. Compared with the ordinary air-lift pump with straight, rising main, it will be seen that the results are 40 per cent. higher. The pump should prove of considerable advantage to the requiring water to be raised from deep wells in the Colonies as well as in this country. In Australia, for example, the wells are mostly of the artesian type, and in many of them the water rises of its own force to the surface, being what are known as gushers; but the air supply in the arrangement described above would have the effect of increasing the supply per horse power. In mining districts where there is already a steam plant extra fittings for the air supply to provide water would be very small, and economy would be obtained in a lessened expenditure in original cost. It should have a great vogue in electric power stations.

### ST. PETER'S CHURCH, BIRMINGHAM.

THE new church of St. Peter, which has been erected in George Street West, at its junction with Spring Hill, was consecrated by the Bishop of Worcester on the 19th ult. It is one of the largest and most important of the new churches of Birmingham, and will form the centre of a new ecclesiastical parish taken out of the districts of All Saints, Hockley, and St. Martin. It has been built in accordance with the provisions of the Birmingham Churches Act to replace the old church of St. Peter in Dale End. The cost of the site and of the building has been paid out of the fund created under that Act, and the Rev. W. H. Parker is the first vicar of the new church. The building has been erected from the designs of Mr. Frank Barlow Osborn, architect. The style is Early Perpendicular, and the materials used red brick internally and externally, with Hinton stone arcades, windows and dressings, and the roofs are covered with tiles. The church depends for its effect chiefly upon its proportions, stability and spacious interior without much expensive ornament. The west end faces George Street West, with a gabled baptistery projecting from the end of the nave, from which it is approached by an archway. On each side of the baptistery are porches leading into the nave, also with gabled roofs. At the west end of the south aisle is the tower, which rises 97 feet from the level of the footpath. The length of the nave is 95 feet.

ches, the chancel 38 feet 6 inches, and with the baptistery total internal length of the church 145 feet. The width of nave and aisles is 54 feet, and across the transepts 68 feet, a transept having a separate entrance. There is a chancel on the south side, and choir and clergy vestries with a chamber over, on the north side. Accommodation is provided for 800, and the whole of the seats are of oak. The chancel is lighted by a great number of traceried windows, including very large ones at the east and west ends. The roof is a fine open timbered one, showing the construction. The church from old St. Peter's Church has been remodelled and fixed to the baptistery. The old bell from the same church has been cast and enlarged, now weighing 1 ton 2 cwt., and has been hung in the tower by Messrs. Barwell & Sons. The old organ of St. Peter's has been enlarged and practically rebuilt by Messrs. Norman & Beard, of Norwich. Part of the old organ from old Christ Church has been refixed in the north transept, and both the organ cases in the chancel have been constructed from the architect's design out of the old mahogany of Christ Church, which is of beautiful colour and quality. The stained-glass window which has cost 340*l.* has been placed in the east window of the chancel. The chancel is paved with Italian marble mosaic. The choir stalls are of oak, simple and rich in design. The oak altar-rail and pulpit, of special design and richly carved, have been made by the contractors for the whole of the work, Messrs. W. Sappcote & Sons, 17 Camden Street, Birmingham. The church has been fitted with electric light by Messrs. Walker Bros., of the Old Square, in such a way that the glare of the light is not in the eyes of the congregation. The carving has been well executed by Mr. Thomas Catley, of Kennington, and includes a very fine life-size figure of St. Peter in the west transept, the heads of King Edward VII. and Queen Alexandra on each side of the west window, and also that of Her Majesty late Queen Victoria in the gable of the baptistery, as the church was commenced in her reign. Internally, on either side of the chancel arch, there is carved the head of a bishop, and the carving on the font is very effective. The cost of the church, exclusive of the organ and site, will be between 10,000*l.* and 14,000*l.* The leaded glasswork has been done by Messrs. Camm & Co., Smethwick, and Messrs. Haden, of Walsbridge, have carried out the heating on a system of compressed hot air and hot water. The ornaments have been supplied by Messrs. Hart, Peard & Co. The altar cross, presented by the parishioners, is in

the style of the Early Decorated period. The processional cross (presented by Mr. G. Herbert Lloyd) is of polished brass on ebony shaft. The type is that employed in the old Breton churches, whereof a fine example is shown in the Louvre. The eagle surmounting the lectern is of very noticeable design, being a copy in brass of the celebrated one in Worcester College, Oxford, carved by Grinling Gibbons. The sanctuary chairs are in oak of the kind usually known as "Glastonbury."

### SOUTHAMPTON IMPROVEMENTS.

A VERY interesting visit was made by the members and Associates of the Society of Engineers on Wednesday, July 16, to the works of the new graving dock and the widening of the Old Extension Quay at Southampton, and afterwards to the Southampton Corporation Waterworks at Otterbourne.

#### *The New Graving Dock.*

The graving dock now being constructed for the London and South-Western Railway Company at Southampton will be the largest of six dry docks belonging to the company, all of which are in constant use. About eight years ago a somewhat smaller dock (but at that time the largest in the world) was opened by His Majesty the King (then Prince of Wales). Since that time the size and number of vessels frequenting the port of Southampton has been steadily increasing, and it has become necessary to provide more dry-dock accommodation for vessels of the largest class. Accordingly, towards the end of 1899 the directors of the railway company instructed their consulting engineer, Mr. W. R. Galbraith, M.Inst.C.E., to prepare designs for the present work, the contract for which was let to Messrs. John Aird & Co. early in 1901.

The dock will be approached by vessels directly from the estuary of the river Test, which forms one boundary of the dock estate. The river channel is being deepened by dredging to form an ample approach to it. The dock itself will be 860 feet long (clear inside gates), with provision for extension if necessary; 90 feet wide at entrance, with the same bottom width inside, and 125 feet wide at cope level. The whole depth from cope to floor will be 43 feet, giving a depth of water over the keel blocks of from 29 feet 6 inches neap tides to 33 feet spring tides at high water. It is built almost entirely of Portland cement concrete, the floor, altars and walls being faced with this material. The bulk of it is made in the pro-

47 STRAND, LONDON, W.C. (FIRST FLOOR).

portion of 8 to 1, the facing to walls and floor, together with the culvert linings, being somewhat stronger, generally 4 to 1. A skin of 4 to 1 concrete is also laid on the underside of the floor, and carried up the back of the walls, so as to prevent any water which may accumulate there from soaking through the more porous concrete into the dock. This 4 to 1 concrete is made with special care, the large stones in the gravel being reduced in a crusher. A mass of 5 to 1 concrete is built in at the skewback, where the walls and floor meet, to resist the heavy crushing stress at that point.

The altars, seven in number, are all grouped near the top. They are 2 feet 6 inches wide and only 2 feet 9 inches high, and thus very safe and convenient to work on. Access to the floor is given by eight flights of steps, and four slides for timbers are provided.

The entrance-gates, which will have a span of 90 feet and a rise of 16 feet 9 inches, will be of steel, and will be worked by direct-acting hydraulic rams. The hollow quoins and cill quoins will be of granite from the Shap Quarries in Westmoreland. The steps and timber slides will also be faced with this stone.

For emptying the dock the water will fall into large pits near the entrance. From these three large culverts will lead it to the pump wells, placed at some little distance behind the eastern wall, and at a depth of 10 feet below the dock floor. Over these the pump-house will be built, and will contain two 48-inch centrifugal pumps, capable of emptying the 85,000 tons of water in the dock in a little over two hours. Space will be provided for a third pump in case the dock should be lengthened. The boiler-house will be built alongside the pump-house.

The site of the dock originally formed part of the extensive mudlands on the river Test shore, which were covered by every high tide. To reclaim the site a bank was tipped round it with chalk taken from the railway company's cutting at Micheldever. While tipping this bank a dredger was at work within removing the top mud, which was very soft and foul. The sea face of the reclaiming bank was pitched with stone to preserve it from storms, and covered with clay to render it water-tight. The latter process was a very troublesome one, owing to the difficulty of finding suitable clay. A supporting toe of 3-inch sheet piling was provided in places where necessary. As soon as the bank was sufficiently sealed to keep out the tidal water the enclosure was dried out with a 9-inch centrifugal pump and engine, erected just inside the bank.

Meanwhile a 1 in 12 incline road, with a winding engine had been built at the bow end of the dock, and as soon as the site was dried excavation by hand gangs, by steam crane and by steam navvy was commenced, the earth waggons being hauled up the incline and emptied on to other mudlands on the dock estate. The surface was thus lowered to a depth of from 26 feet to 30 feet below cope, at which level it was decided the timbered trenches should be commenced, in which the dock walls should be built.

At the entrance end the chalk enclosing bank approached very near the dock, and protection was given to it by driving a complete belt or dam of 12 inch sheet piling across the entrance, which in its turn is supported by raking struts. Inside this again a cross trench was sunk, so as to build the first 20 feet of dock floor, which now forms a massive toe for the timbering. The arrangement of this timbering is worthy of notice. The wall trenches are now being sunk and timbered in a substantial manner, and directly a length is sunk to its full depth the concrete wall is started inside it. When these walls are completed the dumping between them will be excavated in similar fashion and the concrete floor built in length by length. The excavation for the pump wells, &c., is being similarly dealt with, the trench being heavily piled to avoid all risk of displacement. Any water which finds its way into the enclosed area is led by pipes and grips to one or other of two pumps, which are provided to keep the works dry.

#### Old Extension Quay Widening.

The Old Extension Quay was built in 1875, and has been used principally by the large vessels of the Union-Castle Line. It is a tidal quay, well equipped with hydraulic cranes and good cargo sheds, and having a minimum depth of water of 20 feet at L.W.O.S.T. This depth, though at the time of its construction considered very ample, has of late years become quite insufficient to accommodate the large mail boats of this fleet. As the quay is close to the repairing factory and stores of the Union Castle Co., and so very convenient to them, it was thought better to deepen it rather than to construct another quay elsewhere. To effect this it was resolved to dredge to the required depth (30 feet below low water), at a distance of 50 feet from the existing wall, and to cover the intervening space with a platform, which would serve to widen the existing quay to deep water, so that vessels could still lie close alongside.

The design of this platform was the next problem. Its

and that timber is very soon destroyed in Southampton water by the ravages of the wood shrimp, which in a few years is a large timber through. Accordingly it was decided to build the platform of ferro-concrete on the Hennebique system. Piles of this material are built up in vertical moulds, in which are placed the long steel rods which really give the required length. These are laced together with wire stirrups, and Portland cement concrete of excellent quality is carefully put into the moulds and rammed round the steel. After a month the pile is taken out of its mould and conveyed to the quay, where it is driven in position much like a timber pile would be. The ram is exceptionally heavy, however (30 cwt. generally). The head of the pile, too, is protected from being bruised by covering it with a helmet or iron case filled with sawdust. Moreover, a timber dolly is always used. The whole process is novel and interesting.

The work is being carried out in three lengths so as to interrupt traffic as little as possible. Over the first length a temporary timber stage has been erected, on which two large four pile-driving engines for the permanent work have been placed. Each engine is provided with an 8-ton steam winch by which to pitch the piles and to lift the ram and other gear to position.

In the present work it was found impossible to drive the piles down to the required depth, especially in the front row, where they had to go 22 feet into the ground through gravel and hard sand. To overcome this difficulty the water-jet system of sinking was introduced. As beds of gravel and clay occurred it was impossible to sink with the water jet alone. Accordingly arrangements were made to drive and pump simultaneously. The water is fed down a  $\frac{3}{4}$ -inch pipe buried in the centre of the pile and ending in a  $\frac{3}{8}$ -inch nozzle at the point of the shoe. It is supplied from the hydraulic pressure mains, containing water at 750 lbs. per square inch. This pressure is reduced by throttling to about 300 lbs. per square inch for this work. The result has been entirely successful, and the piles are driven to their depth in less than an hour. Progress is retarded, however, by the fact that the piles and their guide timbers can only be fixed at low tide.

When the piles have been driven the concrete round the pile is to be stripped off, and the steel rods for the various beams and struts laid in position. Each set of rods is laced with wire or hoop steel, and surrounded with a timber casing. To this casing concrete is poured and rammed, and each beam or strut thus built up *in situ*. A flooring of rolled joists

and timber decking is laid on top of all. This will contain rails for the trucks and for the hydraulic cranes.

The engineer for the new dock works is Mr. W. R. Galbraith, M.Inst.C.E., and the resident engineer is Mr. F. E. Wentworth-Sheilds, Assoc.M.Inst.C.E., who has kindly supplied the foregoing particulars of the works. The contractors for the works are Messrs John Aird & Co., who are represented by Mr. J. W. Landrey.

#### Southampton Corporation Waterworks, 1290-1902.

The waterworks of Southampton have a history going back to a more remote date than can probably be ascribed to any other such undertaking in this country, it being recorded that on June 16, 1290 (Edward I.), one Nicholas de Shirlee granted to the Friars Minor the right to take water from a spring at Colwell (now called Spring Hill, Hill Lane) to Achard's Bridge, and thence by the king's highway to their church in the town of Southampton. It is further recorded that upon the Feast of the Purification, 1310 (Edward II.), the friars granted the use of the water to the town. On October 3, 1420 (Henry V.), they conveyed to the mayor and community of Southampton all their rights and title in the springs, conduit and pipes, and the waterworks of the town have ever since, for a period of 482 years, remained in their possession.

The original vaulted chambers covering the Colwell spring and one of the old water-houses (adjoining St. Peter's Church), to which the water flowed, may yet be seen. On June 1, 1515 (Henry VIII.) another spring at Lobery Mead (now Grosvenor Square) was presented to the town by John Flemynge. The water was led to a water-house (which until recently could be seen in Waterhouse Lane) and thence to the still existing house, which was quite close to it. From this water-house lead pipes conveyed the water to the town, and, together with sundry wells of a purely local character, including the Houndwell Well (1490, Henry VIII.), constituted the water supply until 1803. The first Act of Parliament was obtained in 1747, followed by others in 1803 and 1810.

About 1804 the No. 1 reservoir was constructed. It collected surface water from the common by means of earthenware pipes, and a line of elm pipes conveyed the water to the town. This reservoir has been abandoned, and the banks levelled down.

About 1811 the No. 2 reservoir, and about 1832 the No. 3 reservoir, was made on the common. They also collected the surface water, which was conveyed to the town by a line of 10-inch cast-iron pipes. They continued in regular use until 1852, after which, and until recently, the water was used only

for road watering. They have now been converted into ornamental waters.

In 1838 the deep well on the common was commenced, and the work was carried on intermittently until 1883, when it was finally abandoned at a depth of 1,317 feet (842 feet in chalk), having involved an expenditure of 20,000*l.* for a yield of only 130,000 gallons per day.

In 1851 a supply of water was obtained from the river Itchen, at Mansbridge, the works comprising a brick and masonry-lined subsiding reservoir (3½ million gallons), a pair of Cornish engines and three boilers, at the same time the two upper reservoirs, Nos. 4 and 5, on the common were constructed. The old supplies were then discontinued, and in 1865 the Mansbridge works were increased by the addition of a second engine and boiler-house, containing a pair of coupled rotative engines and five Lancashire boilers. An additional boiler had meanwhile been added to the older plant.

In 1884 the water in the river Itchen had become so liable to pollution that it was determined to abandon that source and obtain a supply from wells sunk in the chalk at Otterbourne, to accomplish which an Act of Parliament was obtained in 1885. The works were put in hand at once, and the original portion was completed by June 1888. In 1896 large additions were made, and yet further extensions are now in progress.

The Otterbourne works, when the extensions are completed, will comprise two wells and a shaft 100 feet deep, about 1,500 feet of adits, a pumping station at a level of 90 feet above Ordnance datum, containing four compound beam pumping engines and three boilers, a workshop; softening plant, consisting of lime mills, lime cylinders, lime storage tank, mixer, softening tank and filters; four limekilns, a quarry with hydraulic hoist, waste deposit tanks, a railway siding, roadway, and seven cottages for the working staff. The area of land acquired is 13 acres, to which 35 acres and four houses are about to be added for protective purposes.

The quantity of water pumped during the the year 1901 averaged 3½ million gallons, and often exceeded 4 million gallons, per day, the population supplied being about 77,000. The trade supplies equal over one million gallons per day. The capital outlay upon these works has been about 85,000*l.*, to which must be added about 12,000*l.* for extensions in progress.

The water is pumped from these works through a 24 inch main—about to be duplicated—to a covered reservoir on Otterbourne Hill, whence it gravitates to Southampton through

24 inch and 16 inch trunk mains, the surplus water going to reservoirs Nos. 4 and 5, which were covered in in 1897.

The total capital outstanding upon waterworks accounts is only about 170,000*l.*, and, in connection with the very moderate working expenses incurred, enables water to be supplied for domestic purposes at the exceptionally low rate of 10d. in the *£* on assessable value (without extra charge except for fire pipes), and for trade purposes at 8d. per 1,000 gallons, the then being still a surplus sufficient to reduce the general district rate to the extent of 4d. or 5d. in the *£*.

There is being erected an additional independent compound rotative beam engine, of the Woolf receiver type, driving a high and a low-lift pump. The cylinders are respectively 28½-inch and 38½-inch diameter, with stroke of 4 feet 9 inches and 7 feet. The distribution of steam is effected in the high-pressure cylinder, by means of Meyer's variable expansion slides, driven off the crank shaft and the radius of the parallel motion; and in the low-pressure cylinder by means of Cornish valves, driven, by means of tappets and cams, off the crank shaft. The normal speed of the engine will be 18 revolutions per minute, and the indicated horsepower about 125, when working against a head of 235 ft. The steam pressure is to be 60 lbs. per square inch, and coal consumption is guaranteed (under the pain of penalties) not to exceed 2½ lbs. of the best Welsh steam per actual horse-power of work done by the pumps themselves. The condenser is of the multitubular surface type, the water raised by the engine passing through it. The pump is 22 inches diameter, with a stroke of 2 feet 6½ inches.

The low-lift pump, which draws water from the bottom of a well and delivers it to the softening works, is of the bucket and plunger type, the bucket being 22 inches in diameter with a stroke of 5 feet. The high-lift pump, which receives water from the softening works and delivers it into the Otterbourne reservoir, is of the by-pass bucket and plunger type (having suction and delivery valves of exactly the same size and pattern), the pump piston being 19½ inches diameter with a stroke of 7 feet. This pump delivers 10 per cent. more water than the low-lift pump, this quantity of water being pumped for use in the softening process. The pumps are driven from the outer end of the engine beam, the connecting-rod being between them. This engine will be identical with the three already at work. The waterworks engineer is Mr. William Matthews, M.Inst.C.E., by whom the foregoing particulars were kindly supplied.

# The Architect.

## THE WEEK.

IF the campanile of Venice has to be rebuilt, it will be necessary to seek subscriptions from other countries besides Italy. For such a purpose the opinions of artists will in France exercise much influence over the multitude. M. GEORGES BOURDON has endeavoured to record in the *Figaro* the conclusions of several well-known sculptors and painters. M. FRÉMIET says reconstruction is inevitable, but the new campanile must be identical with the old, and an obligation should be imposed on the architects to make the copy rigorously exact. M. DENYS PUECH declares rebuilding is easy enough, and it is possible to impart to the stones a patina which will make them appear ancient. But the new campanile will never be the one which was loved. He maintains there is no use struggling against fate, for everything is doomed to pass away. No one dreams of reconstructing the Parthenon or the Coliseum. Ruins have their poetry; they are more serviceable to evoke beauty than the most splendid structures. It would be better to leave the ruins of the campanile and of the loggia than to rebuild them. M. RENE BINET is of a similar opinion; but if the tower must be rebuilt, it would be better to have it in its primitive form than to suggest the tops of mustard-pots, the Wallace fountains and the American stoves with which modern architects surmount their structures. M. BINET, like M. DENYS PUECH, evidently is not an admirer of French architects. M. MUCHA thinks the campanile was impressive because it was the witness of a glory that has departed. If reconstructed it can only possess a relative value, but he also prefers to have a copy rather than deliver the Place St. Marc to the mercy of architects. M. GUADET, architect of the Comédie Française, believes in reconstruction, the fragments found in the ruins being employed as models for details. M. GÉROME, the painter, also desires to see an absolutely integral copy of the old campanile; but he, too, has a prejudice against architects, and he professes to know them well. He would give severe orders, from which he would not tolerate the least departure. M. NENOT, the architect, is of opinion that unless there is a reconstruction the Place St. Marc will show an excess of horizontality. He, in his turn, sets small value upon the opinions of critics, as they are only the advocates of artists, and they can find arguments for their pleadings on one side as well as on the other. M. BONNAT is also sceptical about the work of modern architects, and, as a philosopher, he holds it is better to accept the misfortune and to think about something else. M. JAMBON, the scene-painter, is afraid of the inventive genius of architects, and although he does not consider the campanile was a great work, yet, on account of its associations, he would have it reproduced without any modification. M. RAFFAELLI wishes to see not only the same form but the new materials resembling the old, as they were subjected to centuries of sunshine and rain. M. EMANUEL ORAZI as an Italian has had the courage to state that the campanile was heavy and formless, without any definite character or artistic interest and out of keeping with its surroundings. People, however, had grown accustomed to the monstrosity and the lamentations arise from the loss of a familiar object. It was like a piece of old furniture, and a reproduction would have a double amount of ugliness, for it would combine the old and the new. The chief loss is the work of SANSOVINO, which was a masterpiece of purity and harmony, and in destroying it the campanile was doing injury to the last. With such a medley of opinions it is doubtful whether Frenchmen will largely contribute towards the rebuilding.

THE reputation of Russian artists rarely extends beyond the boundaries of the empire. One of the exceptions was MARC ANTOKOLSKI. He obtained a médaille d'honneur from the Paris Exposition of 1878, and immediately afterwards was admitted into the Legion of Honour. He became one of the corresponding members of the French Institut. In Russia he was among the councillors of State,

and it was commonly believed that he was the greatest sculptor produced in the North. He died at Homburg on the 9th ult., after a long illness. As he was born in 1842 in Wilna, he had only attained his sixtieth year. Ability is not confined to any rank, and ANTOKOLSKI belonged to that Hebrew race which is the most oppressed class in Russia. His father was only a poor workman. His talent was recognised, and in his twenty-first year he entered the Imperial Academy of Art at St. Petersburg, where he remained for five years. Owing to his failure to gain commissions, and possessing no money to purchase marble, he began his career with modelling little groups of terra-cotta of a humorous kind, like those which are familiar in France and Germany. Many of them were good-humoured caricatures of the people of his race. In 1871, through some beneficent influence, he had an opportunity to demonstrate his power by his large marble statue of IVAN THE TERRIBLE, the first Russian ruler who assumed the title of Czar. IVAN, who lived in the sixteenth century, recalls the mythic legends of wholesale slaughter, but the Russians of a later time consider him to be one of their heroes. The statue is now in Moscow. The success of this work enabled ANTOKOLSKI to carve other statues which were mainly imaginative or traditional in their portraiture. Like many of his countrymen, the sculptor was attracted to Paris, and lived there. He occasionally visited Russia, where his talents continued to be admired, and his death is therefore a national loss.

THE collection of papyrus records relating to the city of Arsinoë in the Fayoum suggests that there was a great similarity between the names of the streets and those in modern towns throughout Europe. Some were called after buildings which stood in them, such as Gymnasium Street and High Temple Street. Others recall the names of deities. Geographical position was also suggested by Lower Street, South Street or Western Street. There were evidently traders' streets, for we hear of Salt Merchants' Lane, Linen Weavers' Street and Clothiers' Market. In Paris, in the vicinity of the St. Lazare terminus, there are streets which from their titles might be presumed to lead to the various capitals of Europe. Something of the kind was found at Arsinoë, as in Arabia Street, &c. Individual names were also used, as Demetrius Street, Theon Street, Ammonios Lane, Therapeia Street. One of the principal thoroughfares was known as King Street. We may yet discover whether the houses were distinguished by numbers and the names of occupants, but we are never likely to ascertain whether uniformity of appearance prevailed among the houses, as in English towns.

AN addition to technical publications has appeared in *Business Illustrated*, an unconventional magazine-review (The Bishopsgate Press). It is intended to occupy a field between the technical journal and the popular magazine. The most interesting article in the first number is devoted to the great horticultural building industry at Loughborough, known as MESSENGER & Co., Ltd. There are ample accounts, with illustrations of the various departments. Not only are there all varieties of horticultural buildings, from the smallest glass to the palatial conservatory, but as our readers are aware, there are a great many appliances for regulating the temperature of the structures, and also special inventions for heating. The Midland Horticultural Works comprise, therefore, workshops for dealing with wood and glass, besides others in which metal is utilised, and thus we find combined foundries, engineering workshops, &c. A vast industry has been created, by which art comes to the aid of nature to enable us to produce and retain colour and form in vegetation which otherwise could not survive in our climate. In describing the works of Messrs. MESSENGER & Co. it does not appear to us that sufficient importance has been attached to the architectural merit of the conservatories. It is possible to carry out architects' designs in various ways, but in the Loughborough structures it is easy to trace a feeling for architecture, and consequently, in all the details, whatever the material employed, we see lines and contours which must gratify the most fastidious. Indeed, in many cases it must be owned that the horticultural annexe is more beautiful than the residence itself.

PAINTERS' ARCHITECTURE: RAPHAEL.

## SURVEYORS AND THE QUEEN VICTORIA STREET FIRE.

By A SURVEYOR.

UNDER the ordinary inquest powers, the City coroner, Dr. WALDO, with the able assistance of Sir HOMEWOOD CRAWFORD, the City solicitor, last month conducted an inquiry upon the Queen Victoria Street fire, and, in addressing the jury on the opening day, the coroner remarked that the duty of the Court was twofold, *i.e.* firstly, it had to discover the cause of the death of the unfortunate persons involved; secondly, to inquire into how far the fatal results of this fire were preventable.

Regarding the latter point, the coroner considered that they would "primarily have to investigate the inefficiency of the fire extinguishing and life-saving appliances and their application by the Metropolitan Fire Brigade;" and, further, "the structural safeguards for the escape from the building concerned—whether such safeguards existed, if so, whether they were sufficient, and if not, why not?"

As far as we are concerned, we will only deal with questions of Fire Brigade efficiency, management, or tactics at the end of these lines, as space permits, for we have had occasion before to express adverse views as to the force in practically everything outside the personal activity and bravery of the men, and the very excellent planning and construction inaugurated in Mr. BLASHILL'S time.

For the moment we would only deal with the "cause" of the fire, and its "preventability" by what the coroner describes "structural safeguards."

As to the "cause," this is of considerable importance to architects, inasmuch as electricity is being installed in nearly all modern buildings under their supervision, and the risks attending electrical installation are not yet fully appreciated by them. There is still an inclination on their part to rely altogether too much on the wiring contractor for advice rather than to call in an electrical consulting engineer to supervise this part of the work, of which the majority of architects can, at the most, have but a superficial knowledge.

The "cause" of the fire, as could be distinctly seen from the evidence of the second and third sitting, was an electrical cause. A certain basket of artificial flowers with illumination lamps, prepared for Coronation purposes, started the fire. This basket was apparently connected to the ordinary mains and the lamps were hence, we assume, under current. Whether the actual first spark was due to "short-circuiting," owing to the insulation in the wiring being worn off—which is not unusual where pendants swing from one point—or whether it was due to a defective lamp becoming over-heated, are points which will probably never be cleared up. But the object lesson is served, inasmuch as the importance of good insulation for pendant work cannot

be too strongly emphasised, whilst the advantage of a double pole switch, more particularly in workshops and factories where all kinds of attachments are frequently made to the different circuits, requires most careful consideration.

Had it been one of the lamps, for instance, that caused the outbreak, the question to ask would be whether the lamps used were English-made standardised lamps or lamps of a foreign make, or what would perhaps be worse, whether they were some of the many inferior lamps technically known as "throw-outs," which several of the English supply companies were recklessly using in order to meet the Coronation demands for a cheap and not necessarily standardised illuminant. It is common knowledge that in order to meet the demands of the Coronation several makers were selling English lamps which, in the ordinary course, they would have broken up as ineffective. There were actually lamps of this description on the market with wrong voltage and wrong candle-power, not to the extent of a mere difference of, say, a 110-volt lamp being supplied for a 105-volt current, or a 210-volt lamp for 200-volt current, or perhaps an 8 candle-power lamp supplied instead of a 5 candle-power lamp. These "throw-out" lamps were actually sometimes as much as 30 to 50 volts out from standard, whilst the supposed 5 candle-power was found to be 16 candle-power, or even more. Such irregularities of course really create a new danger, which has been made more apparent by the Coronation, and the recklessness of the electrical trade generally. It would be well for architects to bear this in mind, more particularly when entrusted with temporary decorations and the like, and to make their contracts subject to responsibility in the case of wrong supplies. We would almost say that these supplies are criminally wrongful, the dangers involved being so far reaching; for with the modern tendency of covering up lamps with shades of all kinds of paper, silk, and even celluloid, the extra heat engendered only too easily becomes the cause of fire.

It would be difficult and unlikely, as we have indicated, for a jury of laymen in the absence of expert assistance to elucidate the detailed electrical cause of the outbreak, and as we have pointed out, it was impossible for the jury to say more than that the fire was caused by electricity, but it might be in the interests of the Institution of Electrical Engineers and of the representative institutions of architects and surveyors if this matter were cleared up. It is, of course, generally known that the rapid growth of electricity for illumination purposes has brought with it a large personnel of unskilled labour and a great amount of negligence, and as in the case of the lamp, so architects should be generally warned against the cheap and dangerous forms of wiring with badly soldered joints, so often adopted by unconscientious electricians.

As far as regulations are concerned, the Building Act does not deal with electrical risks, and our theatre regulations only indirectly deal with them, the matter being mainly left to the discretion of the electrical engineer of the London County Council. Our safeguards lie mainly in the inspections of the insurance companies and the supply companies, and it might be deserving of consideration whether the wiring rules which the Institution of Electrical Engineers itself considers essential should not be administered by some central and responsible authority in the same way as the Building Act is administered from Spring Gardens, with the aid of the statutory district surveyor.

Leaving the general question of "cause," on which the evidence has certainly been very ample, we would now turn to the structural safeguards, which, of course, involve both questions of plan and construction proper.

The offices of the General Electric Company were offices of an ordinary type, situated in a corner building, of which the Company had the whole occupation, and upon its business increasing the directors took additional offices in the upper floors of an adjoining house, breaking through the party wall in order to obtain access. It was through this opening in the party wall that the employees in these upper floors of the adjoining premises had their sole ordinary means of approach and exit.

It is apparently quite clear that there were not forty employees used for manufacturing purposes in this additional block, and according to the Home Secretary's dictum in the House of Commons, the whole of the premises cannot in any way be looked upon as a factory, although from the common sense point of view, whether there were only twenty employees occupied in the actual manufactory as distinct from warehousing, type-writing and book-keeping is mere "splitting straws." At all events, the building was not under the Factory Act, it was not under the Home Office Register, and hence was not subject to the inspection of the London County Council. There is also nothing in the Building Act which would make this building controllable, for it was erected before 1894, had not been subject to any material structural alterations, and even if it had been subject to material structural alterations, it would not even have come under the clause which requires certain buildings to have exits to the roof. Whether the case is affected at all by the regulations for employers' liability we do not know, but as this point has so far not been raised we assume that learned counsel and others do not consider that it has any bearing on the question. The net result, however, is that there is no regulation in force, of all our many laws and by-laws, by which a building of this kind, of which there are many hundreds, if not thousands, within the square mile of the City, can be in any way controlled.

Further, although it has been in the mind of both those who drafted the Building Act and in the mind of many legislators dealing with this Act and with the Factory Act to improve the protection of employees; any attempt to obtain this amendment has always been vetoed by Parliament in some stage or other, with the result that no progress has been made in this direction.

We hold it absolutely essential that all buildings of certain cubical content, and all factories and warehouses employing a certain number of hands, no matter whether they be described as clerks, warehousemen or factory hands, should be subject to control, and above all, that any change in the purpose of a building should be compulsorily notified to the Building Act and Factory Act authorities. As the law stands at present a building may practically contain 200 employees, the majority of whom are clerks, storekeepers, warehousemen and even fitters, who are assembling different parts of an apparatus in order to send them out in its complete form, and there may be only ten or twenty employees actually workmen manufacturing a new article from raw material. Nevertheless, the whole of this structure, with its beehive of 200 hands, is not considered a factory, and does not come under any regulation. The anomaly of this is as obvious as it is serious.

As far as the City inquiry is concerned, there is certainly in law nothing which either landlord or occupier is compelled to do for the safety of the employees. As a matter of fact, it appears from the evidence that there was

some attempt at installing hydrants, fire alarms, and drilling a private fire brigade in order to meet emergencies of this description, which, although done in a very amateur manner, certainly resound to the credit of the occupiers, for attempts in this direction are seldom made among the vast majority of employers.

But to our mind there is a great moral responsibility for every employer of labour in safeguarding his staff, and although we recognise it is common practice not to attend to their safety, we believe that after this fire there will be a very different standard of public opinion on these matters, and that any employer again having the misfortune in the City of London to encounter such serious loss of life among his staff will be held morally responsible, no matter what the legal reading may be. We would hence endorse what the executive of the British Fire Prevention Committee wrote some little time ago, namely, that the fixing of the personal responsibility of employers is one of the main objects that should be striven for. This localisation of personal responsibility of employers is practised in many of the individual States of the United States of America and in several continental countries, and the mere feeling of employers that they can be placed in the dock on a charge of manslaughter for neglecting the safety of their employees would give the whole question of fire prevention, not only in respect to loss of life, but also in respect to loss of property, a very different aspect.

Again, it is obvious that the Building Act requires modernisation, not only on questions of safety of life, as shown by the Queen Victoria Street fire, but also from the point of view of loss of property, for it is indeed a serious matter that the Metropolis should be subject to such a destruction of property as occurred in the Cripplegate and Barbican fires. No remodelling of the Building Act or provision in it to meet modern requirements by modern methods would, however, be complete if the regulations were not made to some extent retrospective; and whilst we do not wish to see the resources of the landlord or occupier drained too heavily with costly "improvements," there are many simple safeguards which are obtainable at small expense, and yet mean much in the safety of the community and the safety of property. Thus, the mere question of the provision of an ordinary trap door and ladder exit on all buildings, new and old, throughout the Metropolis, would be invaluable for the safety of life, whilst much again could be done by the mere pugging of all floors separating shops from tenements, and the compulsory fireproofing of the partition which generally separates the passages from the staircase of a house in front of which a shop has been added.

The Metropolis has always suffered from a decentralisation of administration and a confusion of responsibilities. Thus, there is considerable confusion in the administration of matters referring to the safety of life and property, whether it be by preventive measures, in which we are at present interested, or in questions of the Fire Brigade. Where so much time is frequently spent by the authorities on matters of trivial importance, it would be well to consider whether an entire remodelling of everything relating to fire protection under one central authority might not be of advantage.

If we recollect rightly, the Municipality of Glasgow, which is more far-seeing than we are, had an Act in Parliament not long ago, known as the "Fire Protection Act," in which everything was practically dealt with in relation to the safety of the city, both as to life and property. It is a Fire Protection Act centralising all questions of safety from fire in factories, warehouses, theatres and public places of amusement, as well as in the ordinary tenement, shop and dwelling-house, that London requires at the present time, and with the rapid development of the Metropolis, these questions are becoming of grave import.

It was, we believe, within the scope of the coroner's jury at the Guildhall to make general proposals in this direction by means of a "rider," but the actual rider was a limited one, dealing only with the question of making the Building Act retrospective. It is, however, to be hoped that the Corporation will press for the revision of our fire protective arrangements generally, and we are sure that the comparatively large body of architects and engineers who are located within the square mile of the City will do everything in their power to assist any suggestion in this direction.

It would, indeed, be a boon to architects if there were one central authority and one Act dealing with all questions of fire protection, as far as buildings are concerned, rather than the present unfortunate state of numerous authorities, each with inadequate power and a confused conception of their duties.

And now for the very few words which space permits in respect to the Fire Brigade. To all technical minds outside Southwark and Spring Gardens the inefficiency of the Fire Brigade has been apparent for several years. There are not enough firemen, they are not officered in the right way, they are not properly equipped, and they are most improperly trained. The daring fire-quencher of old and the policy of dare-devilism are only to-day required in a minor degree, and mainly as an attribute to technical knowledge and skill. What we require are firemen who understand buildings and building construction, trained carefully in fire geography and tactics, and officered by men who are preferably surveyors, civil engineers or royal engineers by training. The naval man or the military officer with an amateur liking for the glory of a fireman's life are not the right class of people to select our Fire Brigade officers from. We require something very different, and until the chiefship of the Fire Brigade is changed and the Brigade itself receives a good sprinkling of artisans and mechanics, we are not likely to obtain a Fire Brigade that will meet the exigencies of London. The second officer, we believe, is an old borough surveyor and a member of the Institution of Civil Engineers; it is only to be regretted that he cannot make his influence more felt at headquarters.

In the course of the Fire Brigade evidence, we heard much of the Metropolitan Fire Brigade having the best appliances in the world's market, which statement would have been an obvious untruth had it not been merely due to ignorance. That such ignorance should, however, be seriously put forward in an open inquiry is a disgrace to the London County Council's powers of discrimination in the selection of its staff.

#### THE ENCYCLOPÆDIA BRITANNICA.\*

A PROMINENT feature of the latest volume of the "Encyclopædia Britannica" is the series of articles relating to electricity. They are by recognised authorities on conduction, currents, discharge, lighting, traction, industrial developments, electro-chemistry, metallurgy and magnets. They form, in fact, several treatises on the latest advances of the science. Professor R. H. THURSTON, of the Cornell University, is a well-known writer on engineering subjects in the United States; he describes the newest forms of elevators or lifts which are in use in the lofty buildings in American cities. In his remarks on safety he says:—

Safety devices constitute, perhaps, the most important of the later improvements in elevator construction where passengers are carried. The simplest and, where practicable, most certain of them, is the "air cushion," a chamber into which the cage drops if detached or from any cause allowed to fall too rapidly to the bottom, compression of the air bringing it to rest without shock. This chamber must be perfectly air-tight, except in so far as a purposely arranged clearance around the sides, diminishing downwards and in well-established proportion, is adjusted to permit a "dashpot" action and to prevent rebound. The air-cushion should be about one-tenth the depth of the elevator shaft; in high buildings it may be a well 20 or 30 feet deep. The Empire building in New York is twenty storeys in height, and its air-cushion, at the bottom of 287 feet of travel of cage, is 50 feet deep, extending from the floor of the third storey to the bottom of the shaft. Sliding doors of great strength, and automatic in action, at the first and second floors, are the only openings. The shaft is tapered for some distance below the third floor, and then carried straight to the bottom. An inlet valve admits air freely as the cage rises, and an adjusted safety-valve provides against excess pressure. A "car" falling freely from the twentieth storey was

checked by this arrangement without injury to a basket of eggs placed on its floor, the weight being about 1 ton. The velocity of the fall attained a maximum at about 70 miles an hour, assuming retardation by friction to the extent of about 10 per cent. Other safety devices usually employed consist of catches under the floor of the cage, so arranged that they are held out of engagement by the pull on the cables.

The Employers' Liability Act is reviewed by Mr. MAURICE HILL. He has to acknowledge that definition is difficult or impossible, and all that can be done in each case as it comes before the Court is to decide whether it falls within or without the Act. Many ambiguities have already been made clear by authoritative definition, but no statement of the effect of the Act can be made with any approach to finality. Enamel has been only lately introduced or revived in this country. An article on it by Mr. FISHER, who can claim to have "rediscovered the making of many enamels, the secret of which had been jealously guarded," explains the process, which in good hands can produce gorgeous results. Collectors may find an advantage in remembering that imitations of old enamels, even to the cracks and scratches incidental to age, are now in demand, and sometimes are of a quality to deceive experts. The doctrine of energy in mechanics, which was first announced by SADI CARNOT, "the organiser of victory," is treated by Dr. LARMOR of Cambridge. Steam-engines in the latest forms are described by Professor EWING and gas and oil engines by Mr. DUGALD CLERK. English political history during the reign of Queen VICTORIA is narrated by Sir SPENCER WALPOLE, that of Europe by Sir D. M. WALLACE, and of France by Mr. J. E. C. BODLEY.

The article on fire and fire extinction is partly by Captain WELLS, the chief officer of the Metropolitan Fire Brigade, and partly by General ROCKWELL, of the United States. There is a striking difference between the two contributions. The information given about the London system is mainly statistical, and is sufficient to show that the Fire Brigade has not reached the efficiency which is required for the Metropolis. Although in America the danger from fire has been increased by high buildings and great manufacturing establishments, yet there has been a remarkable freedom from disastrous fire owing to the general employment of fireproof construction, the numerous appliances for the extinction of outbreaks, and the excellent organisation of the firemen. The automatic sprinklers have been proved to be most successful; the automatic alarm has been introduced in more than 600 buildings in Boston and 2,000 in New York. A fire-alarm system is installed in most of the cities and towns. In Boston there is a salt-water fire system consisting of about 5,000 feet of 12-inch cast-iron pipe. Water drawn from an inexhaustible supply can be concentrated in enormous streams upon a given point. Chemical engines and portable extinguishers also find favour. Evidently in the United States invention is encouraged and with satisfactory results. The appearance of the article is opportune, although, unhappily, it is not convincing about our superiority in providing for the encounter with a terrible enemy. The article on forests and forestry, by Professor SCHLICH, of Cooper's Hill College, and Mr. G. PINCHOT, of the Yale Forest School, calls attention to a subject which has been long undervalued in this country. In Great Britain and Ireland, it appears, the population multiplied in the period 1880-1900 by about 20 per cent., whilst the imports of timber have grown by 45 per cent. The wood pulp imported into Britain consumes at least two million tons of timber. Of materials besides timber derived from trees and used for commercial purposes the annual imports are of a value of about eight millions sterling. In Ireland there are three million acres which are useless, and what appears more remarkable, "even within a radius of fifty miles of London 700,000 acres of land are unaccounted for in the official agricultural returns." We might imitate the example of Saxony, which derives a net revenue of 21s. an acre from its State forests. India in twenty-five years has increased the annual revenue from forests.

Without fine timber we cannot have fine furniture. There is not only required beauty of surface, but strength which will allow of delicacy in supports. The breaking of the grain of wood is an expedient which is not favourable

\* The new volumes of the *Encyclopædia Britannica*, constituting, in combination with the existing volumes of the ninth edition, the tenth edition of that work, and also supplying a new, distinctive and independent library of reference dealing with recent events and developments. The fourth of the new volumes, being vol. xxviii. of the complete work. (Published by the *Times*, London.)

to endurance. In some of the examples of the new style, to which Mr. J. H. POLLEN devotes himself in his all too short article on furniture, the contorted lines are sometimes arranged in order to avoid ill effects. As was to be expected from long service among the old examples in South Kensington, Mr. POLLEN is not favourably disposed towards the L'Art Nouveau. He says:—

The French makers of the new style of furniture seem in some instances to have a positive distaste for straight lines. They delight in strange curves, usually sweeping curves with sudden twists. Wardrobes and china closets are pyramidal, chairs and seats have raking legs, table-legs are fortified with bronze, &c. One cabinet is made to represent a leaf-clad arbour, with tree-trunks, branches and boughs entwined to the life. A pianoforte in the American section of the exhibition was no less extreme an instance of the new taste, a tree-trunk being carved along the front of its bed. Such an instrument as a pianoforte is entirely artificial; the very wood of it is taken from the choicest part of the tree, dried and prepared with the utmost care. How is this symbolised by a stem to imitate nature, however well sculptured? It is obvious that an interior furnished in this manner must be lacking every desirable qualification for home life. A piece of furniture is not a painting; it has a use, and the use must be kept in sight throughout. The naturalism of the Nancy workers extends to the working of the metal; the ormolu lines of flower and leaf-work are fastened along the edge of cabinets and wardrobes, and then carried up to the tops, where they bend over and form a sort of buttress to support a shelf. In chair frames the craftsmen bind all parts of the seat, as if a kind of strap were necessary round a decaying object. As lightness is a merit in chairs, brass bars and straps ought not to be necessary to their security. The marquetry work of this modern school is also purely realistic, and the attempt is made, notably by Gallé of Nancy, by various coloured woods, to represent nature in colours, a questionable use of that form of decoration when applied for use.

The articles on gas explain the endeavours towards enrichment by means of tar, oil gas, volatile hydrocarbons, &c. The introduction of incandescent mantles is a result of long and anxious experiments. They are generally composed of 99 per cent. thoria with 1 per cent. cerium. Professor LEWES is clear and concise in his explanations. Mr. DOWSON in his article on gas plants points out "that a modern Dowson gas plant is now working regularly at the historical works of BOULTON & WATT at Soho, Birmingham, and that the holder used for this gas is one which was erected there by WILLIAM MURDOCH, the pioneer of gas lighting."

There is a valuable contribution on geology by Sir A. GEIKIE, relating to the changes of view and additions of knowledge in the larger questions involved, such as the cosmical aspects, dynamical and structural geology, which are described with characteristic vigour. In Zonalstratigraphy it is concluded the next advances will be made in the investigation of formations and the history of organic life. In connection with the great problems of space and force which geology suggests there are possibilities for the use of non-Euclidian geometry, of which the Hon. B. A. W. RUSSELL is the exponent.

The new volume, like its predecessors, is noticeable for its variety, and the literary skill shown in the treatment of the subjects removes it from the class of the old encyclopædias. There are certain branches of science which it is almost impossible to discuss with a light hand, but with those exceptions it is surprising with what pleasure the majority of the pages can be read. The illustrations include plates of English and foreign pictures.

#### AN INDIAN ARBITRATION CASE.

THE position of an arbitrator in a building case is onerous, and the courts to whom such subjects appear often as insoluble problems generally are disposed to uphold his decisions. An Indian case which came before the judicial committee of the Privy Council a few days ago will exemplify the practice. It related to the erection of the Victoria Jubilee Town Hall in Lahore, a building which was completed in 1890. On the completion of the work disputes arose between the contractor, Mr. BUTA, and the Municipal Council, which it was arranged should be referred to Mr. J. C. HAYWARD and Mr. P. ROSS. The award was published on June 30, 1891. Mr. BUTA, as contractor,

wrote on the same day asking for (1) a copy of the award given by the arbitrators; (2) a copy of the details furnished by the arbitrators in respect of all the items; and (3) a copy of the order given by Mr. SINCLAIR, junior Government advocate, in reply to the letter addressed to him by the secretary of the municipal committee, under which a decision was passed as to the powers of the arbitrators. On July 27 Mr. BUTA wrote to the arbitrators raising objections to the award and stating that unless he got a "sound and satisfactory answer" to his objections he was not prepared to accept the award. The Council, however, accepted the award, and the plaintiff was informed on July 30 that they were prepared to hand him "a cheque for the balance of the amount due, after deducting from the amount of the award the sums that have been paid to you already." Application was made to have the award filed, and the balance, amounting to 10,395 rupees, was paid into Court and afterwards handed over to Mr. BUTA. He subsequently filed a plaint for adjustment of accounts and recovery of the money that may be found due to him for work done and materials supplied under the contract of 1887, for additional work done outside the contract and for damages. No reference was made to the arbitration and award, but the defendants relied upon the plaint as an answer to the greater part of the demand, and they disputed the claim for damages. The plaintiff by his replication challenged the award on the ground that "the arbitrators exceeded their jurisdiction and were guilty of misconduct," and that, "if valid, it was so only to the extent of the matters with which the arbitrators dealt." In the agreement of reference it was stated that in addition to questions relating to measurements and prices the arbitrators were to consider "all other matters in difference, controversies, claims and demands whatever now subsisting or depending by or between the said parties, or in any wise incident or relating thereto." The arbitrators having applied to the secretary of the Municipal Council as to whether the clause was distinct or subordinate, he wrote to Mr. SINCLAIR, who said the clause "merely covers any incidental or minor matters arising out of the main subject of the reference to arbitration, viz.—(1) measurements; (2) rates where not fixed, and must be taken and construed accordingly." The correspondence was not communicated to the plaintiff until after the award was made, and the omission to do that was one of the acts of misconduct charged against the arbitrators. Their lordships of the judicial committee considered that although there might be an error of judgment on the part of the arbitrators there was no ground for impeaching the good faith of any of the parties concerned or the correctness of the opinion given by the counsel consulted. It was also alleged that Mr. HAYWARD delegated his duty to his son and employed him to take the measurements instead of taking them himself. On that point the evidence of Mr. ROSS was that "Mr. HAYWARD was present when the measurements were taken except once, and he was present throughout the inquiry except once, which was towards the end of the inquiry. Their lordships said that the parties had the benefit of Mr. HAYWARD's experience and judgment on the matters referred to him, and there was no doubt that an arbitrator might delegate to a third person the performance of acts of a ministerial character, which was at most all that Mr. HAYWARD did in this case. The charge of misconduct against the arbitrators therefore failed as regarded the form of the award. Their lordships saw no reason to doubt that the arbitrators came to an honest determination upon the specific matters referred to them, and any faulty direction they might have given in excess of their authority might be treated as null. On all other matters the judicial committee were no less decided, and finally it was resolved that they would humbly advise HIS MAJESTY that the decrees of the Chief Court of the Punjab of July 20, 1898, ought to be confirmed and the appeal dismissed. The appellant must pay the respondent's costs of the appeal. The case is remarkable as coming from India, and the points raised on appeal were remarkably subtle. There was undoubtedly a want of precision in the agreement of reference, but their lordships evidently considered that from the character of the inquiry it should not be scrutinised too closely.

## CORYAT AND THE CAMPANILE.

THE following letter has appeared in the *Times* :—

Sir,—In the year 1610 Thomas Coryat, of Odombe, in Somerset, the absurd but admirable author of "Coryat's Crudities," spent six weeks out of a four months' foreign tour at Venice. In his book, which was printed the following year, he particularly describes the tower of St. Mark's, dwelling with delight on the commodity of its ascent and the beauty of the view to be obtained from the summit. Would it interest your readers, while the recent catastrophe is fresh in their minds, to learn how these things struck an impressionable English traveller 300 years ago? Most people have heard of Coryat and of the grotesque humours by which it was his pleasure to make himself a butt among the wits and courtiers of his time. But his book is rare, and only students read it, or know how well he could observe and write when he chose to lay his fooling aside. Even of students, most, I dare say, remember another and less edifying passage from his account of Venice rather than the one I am about to quote. Yet the serious charm of the city, "the fairest lady, nay the richest Queene and Paragon in Christendome," as he calls her, loses nothing in passing through the "Odombian limbecke," and from the days of James I. to those of Victoria no one has expressed that charm in terms more just and glowing.

There are many notable things (writes Coryat) "to be considered in this Piazza of St. Marke, the principall whereof I will relate before I come to the description of St. Marke's Church and the Dukes Palace. Most memorable is the Tower of St. Marke, which is a very faire building, made all of bricke till towards the toppe, being distant from St. Markes Church about some eighty foote. It is from the bottome to the toppe about some two hundred and eighty foote, and hath such an exceeding deepe foundation that some doe thinke the very foundation cost almost as much as the rest of the building from the ground to the top. This Tower is square, being of an equall bredth in every side—namely forty foot broad. The whole top is covered with pieces of brasse, made in forme of tyles that are gilt. Such is the height of this Tower that in a faire season it is to be seene by sea from Istria and Croatia, which is at the least one hundred miles from Venice; the staires are made after such a strange manner that not only a man, or woman or child may with great ease ascend to the top of it, but also an horse, as it is commonly reported in the citie. But I thinke this will seeme such a paradox and incredible matter to many, that perhaps they will say I may lie by authority (according to the old prouerbe) because I am a traoueller. Indeed, I confesse I saw no horse ascend the staires, but I heard it much reported in Venice, both by many of my countrey-men and by the Venetians themselves; neither is it unlikely to be true. For these staires are not made as other common staires by which a man can ascend by no more then a foote higher from staire to staire till he commeth to the highest; but these are made flat, and ascend so easily by little and little in heighth, that a man can hardly be weary, and scarce perceiue any paines or difficulty in the ascent. . . . When you haue ascended almost as high as you can, you shall leaue the staires, and enter into a voyde loft, and from that you are conueyed by a short ladder into a little square gallery butting out from the Tower, and made in the form of a tarrasse, being supported with faire round pillars of alabaster. From euery side of which square gallery you haue the fairest and goodliest prospect that is (I thinke) in all the world. For therence may you see the whole modell and forme of the citie *sub vno intuitu*, a sight that doth in my opinion faire surpasse all the shewes vnder the cope of heauen. There you may haue a synopsis, that is a generall view of little Christendome (for so doe many intitle this citie of Venice) or rather of the Ierusalem of Christendome. For so me thinks may a man not improperly call this glorious citie of Venice: not in respect of the religion thereof, or the situation, but of the sumptuousnesse of their buildings, for which we reade Ierusalem in former times was famous about all the Easterne cities of the world. There you may behold all their sumptuous Palaces adorned with admirable variety of beautiful pillars: the church of S. Marke which is but a little way therence distant, with the Dukes stately Palace adioyning vnto it, being one of the principall wonders of the Christian world; the lofty Railto, the Piazza of Saint Stephen, which is the most spacious and goodly place of the Citie except S. Markes; all the sixe parts of the citie. For into so many is it diuided as I haue before said; their streetes, their Churches, their Monasteries, their market places, and all their other public buildings of rare magnificence. Also many faire gardens replenished with diuersity of delicate fruites, as Oranges, Citrons, Lemmons, Apricocks, muske melons, anguriales, and what not together with their little Islands bordering about the citie wonderfully frequented and inhabited with people, being in number fifty or there about. Also the Alpes that lead into Germany two waies, by the Citie of Trent, and the Grisons country; and those that leade into France through Sauoy, the Appennines, the pleasant Euganean

hills, with a little world of other most delectable objects; therefore whatsoever thou art that meanest to see Venice, in any case forget not to goe up to the top of Saint Markes tower before thou comest out of the citie. For it will cost thee but a gazet, which is not fully an English penny; on the toppe of the tower is erected a brasen Angell fairely gylte, which is made in that sort that he semeth to blesse the people with his hand."

When lately that angel was cast down in the very vestibule of St. Mark's Church, and the tower and its staircase sank together, Coryat must surely have turned in his far-off grave at Surat, where he died six years later, after long wandering in Egypt, Palestine, Mesopotamia and the East Indies. The sequel of his description concerns the Loggetta of Sansovino, now shattered with all the rest. Living in the flush of the English Renaissance, Coryat shows himself full of enthusiasm for this work, which Ruskin, the impassioned Gothic gossamer of our own age, had no eyes for, and would little have missed even had it perished in his day.

"There is adioyned vnto this tower a most glorious little roome that is very worthy to be spoken of, namely, the Logetto, which is a place where some of the Procurators of Saint Markes doe vse to sit in iudgement, and discusse matters of controuersies. This place is indeed but little, yet of that singular and incomparable beauty, being made all of Corinthian worke, that I neuer saw the like before for the quantity thereof. The front of it looking towards the Dukes Palace is garnished with eight curious pillars *versicoloris marmoris*, that is, of marble that hath sundry colours; whereof foure are placed at one side of the dore, and foure at another. The steppes of the staires, which are in number foure, are made of red marble. Two faire benches without it of red marble. The walke a little without paved with Diamond pauier contriued partly with free stone, and partly with red marble, all the front of red marble, except the images, which are made of most pure alabaster ouer the tribunal where the Procurators sit, the image of the Virgin Mary is placed bearing Christ in her armes made of alabaster, and two pretty pillars of changeable-coloured marble on both sides of her, under whom this is written in a little white stone, *Opus Iacobi Sansouini*. The sides of the dore are made of alabaster, and the top rayled with a curious tarrasse of alabaster. On both sides of the dore are foure very goodly faire statues made in brasse, two on one side and two on the other. Each betwixt a paire of those curious pillars that I haue spoken of; on the right hand as you enter the dore there are these two, the statue of *Mercury* with a dead man's skull under his feete; the other the statue of *Peace* with a burning torch in her hand, wherewith she burneth an helmet (a strange thing to burne steele with fire) and a Target. On the left hand these two; Pallas very exquisitely made with an helmet and a feather in the crest, a shield in one hand and a trunchin in another, a mantle about her and a Souldiers coat of maile; the other the statue of *Apollo* like a stripling without a beard, with an horne in one hand and a quier full of arrowes in another hanging down about his necke. All these statues were made by Iacobus Sansouinus, a Florentine."

I am, Sir, faithfully yours,

SIDNEY COLVIN.

## THE CAMPANILE AND CEMENT GROUTING.

IN a letter to the *Times*, Sir E. Durning-Lawrence says :—It seems now to be demonstrated that the cause of the collapse of the Campanile of St. Mark's was that the materials of which it was composed had by the lapse of time lost their coherence, so that the whole was little better than a mass of dry dust. It is therefore not unnatural that others as well as your correspondent whose letter appears in the *Times* should be persuaded that it would have been an impossible task to have rendered this grand old tower once more safe and strong and able to endure for another 1,000 years.

This is, however, a mistaken view, as it would have been perfectly easy and even cheap to have made the structure as strong and, perhaps, even stronger than when first erected.

Any tower of masonry which is fairly upright and the foundations of which are not hopelessly irreparable can be rendered strong and safe, as the Campanile could have been rendered strong and safe, by the simple process of drilling holes about 4 inches in diameter nearly through the masonry (masonry includes brickwork) and pumping into the structure Portland cement grouting. The holes should be about 3 feet apart, and commence at the bottom. It is generally possible to do this work from the inside so that the facework is not in any way disfigured. In the case of the perished Campanile about eight or ten thousand such holes would have been required, and these should have been cut or drilled at the rate of about fifteen or twenty a day, commencing at the bottom of the tower, the Portland cement grouting being pumped into the holes each day as the work proceeded. The whole process

would thus have occupied about two years, the labour on each hole for drilling and filling costing about three francs, or half a crown. About 400 or 500 tons of Portland cement would have been required, say, 1,500*l.* to 2,000*l.*; superintendence and further repairs to stonework and contingencies about a further 2,000*l.*, so that 5,000*l.* would probably have perfectly restored the whole.

Treated by this method the Campanile would perhaps have been considerably stronger and more durable than when first erected. An old brick, which is scarcely more than a mass of dry dust, becomes when it has absorbed Portland cement grouting hard and strong, while the mere dry rubbish in the centre of the walling forms a solid mass of Portland cement concrete as hard, solid and durable as the best natural rock.

This process is exceedingly safe, simple and easy, and only two precautions are necessary, viz. not to proceed too rapidly with the work, and to take care that the Portland cement selected is of good quality and has been what is technically called "killed," i.e. exposed to the air on a barn floor for some two months before being used as grouting in order that it may not expand—or "blow," as it is called—after it has been pumped into the walling.

Nearly any masonry structure and most natural rocks can be rendered permanently strong by this simple process of pumping into them a grout of Portland cement, which is now being largely used by engineers in various parts of the world.

### CHESTER CATHEDRAL.

ON July 31 there was a dedication service held in Chester Cathedral on the completion of the memorial of the late Duke of Westminster.

The memorial takes a twofold form, and has been subscribed for by both city and county admirers of the Duke. Of the 10,000*l.* subscribed for the purpose, 7,000*l.* odd has been devoted to the restoration of the south transept, 1,849*l.* to a recumbent effigy of the late Duke in marble, and the sum which remains to various necessary incidentals. The south transept, which was once the parish church of St. Oswald and is a structure that has an interesting history, long presented a dilapidated incongruous appearance, parts of the stone walls and pillars having lain hidden under a coating of whitewash since, it is said, Reformation times, while other parts were chipped and broken, and there was a wretched boarded floor. Under the guidance of Sir Arthur W. Blomfield & Sons (the cathedral architects) Messrs. J. Thompson & Co., Peterborough, who were given the contract to fulfil, have wrought a wonderful transformation in the transept's internal appearance. The stone of the columns and walls, scraped of its whitewash, looks perfectly new, and this and the repair of the decayed and dilapidated stonework have made a vast improvement in themselves. But the restoration has proceeded much further. The stone vaulting of the western aisle has been completed, and the broad aisle has been vaulted in oak to harmonise with the architecture of the nave. The old boarded floor has been removed, and substituted for it is a level flooring of hard Yorkshire flags, laid on a bed of concrete. All these improvements have given the south transept of Chester Cathedral—one of the largest south transepts in the kingdom—a graceful and dignified interior, and have brought it into harmony with the general scheme of the cathedral architecture. The larger bosses in the centre aisle depict Old Testament scenes, and the four coloured ones are heraldic, representing the arms of the Grosvenor family, the Archbishop of York, the Bishop of Chester and the Dean of Chester. The bosses in the western aisle, which are carved out of huge blocks of stone, represent scenes in the life of our Saviour, including the Baptism of our Lord, the Transfiguration, the Resurrection and the Ascension.

The recumbent effigy by Mr. Pomeroy of the late Duke has been placed in the centre bay of the western aisle, and rests on a sarcophagus or altar tomb designed by Mr. Chas. Blomfield in sixteenth-century style. The latter is worked in Staffordshire alabaster, and is divided into eight large panels, each containing a heraldic shield of the Grosvenor arms; and the capping, which is one piece of alabaster, is a solid bronze bearing in raised burnished letters the inscription, "To the Glory of God and in memory of Hugh Lupus Grosvenor, first Duke of Westminster, K.G., Lord Lieut. of the County of Chester. Born October 13th, 1825, died December 22nd, 1899." The effigy is in Carrara marble of the purest quality, and is a fine example of the sculptor's art both as regards the fidelity with which the features of the late Duke have been reproduced, and the beauty and finish of the carving. The recumbent figure lies in a position of calm and natural repose with the head resting on a cushion, the feet touching lightly the back of a Talbot dog, and the hands meeting across the breast. The figure is robed as a Knight of the Garter, and

in the droop of the drapery, as in other portions of the work, the sculptor has attained as near perfection in stone as one can conceive to be possible. The effigy rests upon a plinth of Sienna marble, which intervenes between it and the alabaster tomb. The latter has been executed by Messrs. W. Haswell & Son. The same firm has also done the polished marble floor of Genoa green and Pavonazza which surrounds the monument, and had charge of fixing the memorial in its entirety. The monument is enclosed by ornamental railings, consisting of a bronze plinth, wrought-iron sides relieved by bronze mouldings, and at each angle a Talbot dog holding a heraldic bannerette. All the metalwork has been carried out by Messrs. Hart, Son, Peard & Co, London and Birmingham.

### STONEHENGE.

IT was anticipated that a long discussion about the control of Stonehenge would be heard at the meeting of the Wilts County Council on Tuesday. But the effect of a letter from Sir Edmund Antrobus, which was referred to by Lord Edmond Fitzmaurice, M.P., was to delay the proceedings for the present. His Lordship said:—That letter, the actual text of which he was not warranted, without leave, in communicating to the Council, in his opinion opened up a reasonable prospect of successful negotiations for the purchase of Stonehenge. The letter concluded by giving him a very courteous invitation to visit Amesbury in order to go into the matter with Sir Edmund Antrobus. Beyond that he could not then go, except that he thought it was only due to Sir Edmund Antrobus that he should immediately say this, that the statement which he supposed they had all heard, and which had got into the public Press, that Sir Edmund Antrobus ever asked 125,000*l.* for Stonehenge and the land immediately adjacent was quite untrue. That matter related to a far larger negotiation, and not only was it not the figure named for Stonehenge, but it related to negotiations for land from which Stonehenge was expressly excluded. He thought it was only right that he should say that, because he thought it would clear the air. Another aspect of the matter which he wished to urge upon the Council was to express his deliberate opinion that to have a discussion about rights of way and other topics seemed to him to be an unnecessary and a risky thing in the present circumstances, because it might interfere with the success of those negotiations to which he had alluded for purchase, and to which, it seemed to him, they must eventually look forward as a satisfactory solution of the question. His object in making that statement was to ask the Council whether it was worth while discussing the question at all that day.

The Hon. Percy Wyndham, as chairman of the roads and bridges committee, had given notice to move the following resolution:—"That the Council, being informed by the report of the committee on roads and bridges that such committee, having duly considered the reports of the three members of the sub-committee appointed to hold an inquiry into the subject matter of the petition of the Amesbury Parish Council under section 26 (4) of the Local Government Act, 1894, alleging a failure on the part of the Amesbury Rural District Council to take action in regard to the obstruction of certain alleged public rights of way at Stonehenge, and having also taken into consideration the evidence given at the above-mentioned inquiry, do not recommend the County Council to take over the powers and duties of the Amesbury Rural District Council in regard to the alleged rights of way. That the County Council further record their agreement with the opinion expressed by the committee that the question of public free access to Stonehenge and the enclosure of the monument, which were largely mixed up by the petitioners with the questions of the rights of way, are not questions in regard to which the Council has jurisdiction." Mr. Wyndham said he was quite willing to accept generally what Lord Edmond Fitzmaurice proposed. The motion he was going to move would no doubt have led to a general discussion, but in the circumstances he would not move it.

Mr. J. M. F. Fuller, M.P., said he fully agreed with the course it was proposed to adopt, because he thought it would be a public disadvantage to go into the merits of the case after what Lord Edmond Fitzmaurice had said. It was well known, however, to many members of the Council that he was prepared to move in the matter, but he now joined with the previous speakers in expressing the earnest hope that nothing more would be said at that meeting of the Council.

Lady Butler, the wife of General Butler, commanding the Western District, on Monday laid the corner-stone of an obelisk which is being erected by Mr. Molesley on Plymouth Hoe to the memory of Prince Christian Victor and the soldiers of the West of England who fell during the South African war.

### NOTES AND COMMENTS.

It is to be hoped that if any negotiations are entered into for the purchase of Stonehenge they will be conducted with tact. Salisbury Plain has been for so long a time regarded as a common, it was to be expected that people in general should imagine that Sir E. ANTROBUS had no right to prohibit the public from approaching the stones in any way they pleased, or to enclose the ground with a barbed-wire fence. We have already pointed out that in this case, as in others of minor importance, law must be respected, and it declares that an owner's rights are of paramount importance. The Wilts County Council have no wish to undertake the costly experiment of asserting imaginary rights. The task would therefore fall upon the local parish council, that under the circumstances would appear as a litigant under most unfavourable conditions. We do not believe that the owner is desirous to make a profit out of Stonehenge, but he is not to be blamed for upholding his claim to the land with whatever stands upon it. In any case it will always be possible for a visitor to see Stonehenge, and the interest and mystery of the stones are not in the least diminished by the precautions taken by the proprietor.

It is difficult to resist the conclusion that technical assistants of all kinds are not in favour with the official world. It has repeatedly occurred that men of that class have been passed over when opportunities for promotion arise, and the appointments given to officials who have only the general knowledge of the ordinary Civil servant. Routine always wins the day in a competition with skill. But it is not only in promotion that a difference is made. The grievances of the Ordnance Survey employés which were brought before the House of Commons by Sir BARRINGTON SIMEON and Major LEE afford a remarkable revelation of the partial way in which pensions are bestowed. Assistants appointed prior to 1870 are in receipt of pensions, but the men appointed after that date, who perform identically the same work, after spending the best years of their life on the Survey, are treated as day labourers, and when they leave the service do not receive the least compensation. The principal reason adduced is that discontent would certainly be created in one half of the staff if pensions were allowed to the other half. Everyone is aware that in the Civil Service jealousy is rampant, and a man is no sooner promoted than those who have a chance of succession begin to speculate about his disgrace or death, but it was not to be expected that in a department like that of the Ordnance Survey there should be a desire to restrict pensions to a limited few, although an increase in the number of pensioners would not diminish the amounts which were arranged. It is more probable the true cause is the dislike to men who have had a technical training.

DURING last week many members of the Royal Society of Antiquaries of Ireland visited Londonderry and other places in that district. Archæology is not suggested by the property of London companies. But although the modern spirit may prevail, that part of Ireland can show as many records of old times as districts in the south or west. Derry appears to have possessed a church as far back as A.D. 546, and it has been a bishop's see since 1148, or some years prior to the English invasion. The reputation of Londonderry is in modern times mainly connected with the famous siege of 1688-89. Some of those who took part in the excursion visited Brough, where the gold ornaments now in the British Museum were found in 1896. The circumstances under which the objects were obtained have been described by Mr. ROBERT COCHRANE, F.S.A., the honorary general secretary, in a paper which we shall publish next week. It will be observed he suggests that the ornaments have had a local history, and without any disregard of probability, they might have been memorials of the visit of St. COLUMBA to the district, and votive offerings for his delivery from shipwreck on his voyage to Ireland with a Scottish

king. When the trial takes place the right to the possession of the ornaments will be contested on other grounds than those furnished by archæology. But in such a case too much information cannot be forthcoming. Another place visited is the Greenan of Ailech, about four miles from Derry. It is a prehistoric fortress. In the fourth century of our era we are told that FRIGRIUN, a famous builder or architect, eloped with the daughter of the king of Scotland, AILECH, and brought her over for protection to Ireland. King FIACHA gave them this fortress for a residence, and hence it is called Frigriun. This king FIACHA was killed in battle A.D. 322. Here FRIGRIUN built a splendid palace of wood for his wife. The material was red yew, carved and so studded and emblazoned with precious stones and gold and bronze "that day and night were equally bright within it." The ancient Irish admired architecture as well as other arts, and it is not every country which can produce a parallel to the interesting legend.

M. GUILLAUME, the French sculptor, is a gentleman who is remarkable for urbanity no less than for administrative and artistic skill. For the third time he has been elected as Director of the French Academy in Rome. The sculptor dates his acquaintance with Rome from 1845, when he entered the city as winner of the Grand Prix. He has had a long experience of official responsibilities. In 1864 he was appointed Director of the Ecole des Beaux-Arts; he held the post for about fifteen years. Then he became Director-General of Beaux-Arts. Afterwards he was sent to Rome, and he has presided over the Villa Medici for eighteen years. M. HÉBERT, his predecessor, held the office for five years, HORACE VERNET for six years and INGRES for six years. SCHNETZ was director for nineteen years, but they were not in succession, for there was an interval of six years between the two terms. M. GUILLAUME is one of the few artists who is a member of the French Academy. He owed his election to his writings on art, which we have noticed at some length. But the sculptor of the *Gracchi*, *Le Faucheur*, *Anacréon* and the Caryatides of the Pavillon Turgot has had to sacrifice his art for the sake of devoting himself to official duties.

FRENCH tapestry, if we may judge from the prices given for old pieces, is never likely to be superseded in the affections of one class of amateurs. Like CLEOPATRA, age cannot wither it, for the older it grows the more reposeful are the colours. The official exposition which has been organised in the Grand Palais of the Champs-Élysées will probably be more visited by artists than by any other section of the inhabitants of Paris. The exhibits belong to all the periods that have elapsed since COLBERT bought the factory belonging to the GOBELIN family in 1662 down to the last century. Tapestry was woven at the expense of the State in various parts of Paris, but the Minister wished to have them all united under one controlling power. CHARLES LE BRUN became director, and the style associated with his name was long respected in the factory. But designs were obtained at all times from some of the first artists in Paris, and it was often difficult to understand why a composition was executed in tapestry rather than in oil-colours. In order to keep up the reputation of the tapestry the wool used was dyed in the factory. CHEVREUL, the famous chemist, was appointed superintendent of the dyeing department. He received several complaints about the want of permanence in some colours and the want of vigour in others. After many investigations he ascertained that the wool dyed at the Gobelins was equal to any he could purchase, and he was obliged to seek another cause for the failures. His researches enabled him to announce the law of the simultaneous contrast of colours, which was made the subject of a book published in 1835. The Gobelins factory is, therefore, connected with the history of science in France, as well as with the history of art. It is satisfactory to know that the labours of the chemist, as well as of the artist, have produced works which seem destined to survive all the vicissitudes of taste.

## ILLUSTRATIONS.

BEACON TOWER, MARINE RESIDENCE, WALMER, KENT.

**W**ALMER LODGE, Walmer, of which we present some plans this week, and a sketch of one of the features of the elevation, and of which we also presented a perspective view of the hall and a perspective view of the principal staircase on July 11, is the marine residence of Mr. ALBERT OCHS, which has been recently entirely remodelled from designs by and under the personal supervision of Mr. EDWIN O. SACHS.

The property, when purchased by Mr. ALBERT OCHS, comprised a rambling house of exceptionally ugly appearance and eminently impractical plan, the result apparently of numerous previous alterations and additions by an amateur.

The position of the building, overlooking to the east the Goodwins, with Walmer Esplanade on the north and

Walmer Castle abutting on the south, made it, however, well worth the owner's while to spend much thought and labour on making the house a thoroughly practical residence to meet the requirements of the modern week-end of a business man, as well as the general entertainment and house parties of a country season. And it should here be remarked that the position of Walmer lends itself particularly well to business men, inasmuch as it is within easy motor-drive of some twenty minutes from Dover, which has boat-express trains to town and excellent continental services.

Mr. SACHS's instructions were to gut the worst portions of the building, alter such part of the premises as could be adopted, and to add a wing with the view of obtaining extra accommodation. There was, further, the specific instruction of creating a good look-out tower, from which an extensive view, both seawards and landwards, could be enjoyed, and that some attempt should be made to render the exterior of the structure less displeasing to the eye than at the time of purchase. The result has been a ground-floor plan comprising a small vestibule, a large square oak hall with gallery, and staircase hall, around which are grouped the

large drawing-room and library, secretary's room, dining-room with servery, and billiard-room, as well as a small schoolroom. This floor has an average height in the old part of 12 feet from floor to floor, and in the new part of 13 feet 6 inches. The hall, gallery and staircase are treated in light oak, in the English Renaissance style, as already illustrated. The drawing-room is in the Louis XVI. style, the dining-room in Queen Anne style and the billiard-room in Dutch style. Parquetry is laid throughout. Electric light is installed to a very considerable extent here, as throughout the house, and all the modern facilities of speaking tubes, telephones and the like have been made use of. Fire hydrants have been installed and all the various services of hot-water heating, hot and cold water supply.

A special feature are the dado rails throughout this floor, from which electric light can be obtained at any point, as they are grooved and fitted on the E.L.B. system.

As to the first-floor, Mr. SACHS had to accord the accommodation of a morning-room in the best position, and the necessary bedrooms for the family, including three children, together with tutor's room and maid's room. Besides these, spare rooms had to be provided—three double-bedded and one bachelor's room. Three bathrooms were provided in suitable positions. The feature of this floor is a long passage or corridor reaching from end to end, with light at each end, intended to be a useful "quarter-deck walk" in bad weather. The decoration of the first-floor rooms is of the simplest character, with whitewood fittings.

The new wing alone was taken up to form a second-floor, with servants' accommodation, and has been entirely devoted to this purpose, but the back staircase is continued up into the tower, from which a particularly excellent view can be obtained. The height of the tower from ground to top of finial is 85 feet. The finial is equipped with an electric light and weather vane, and a large gong bell has also been fitted in the tower.

Turning to the basement, Mr. SACHS has so arranged this lower floor as to enable an easy service with a small staff when used for week-ends in the winter, and yet sufficient accommodation for large entertaining in the summer. Thus, there is a large kitchen and also a scullery kitchen, a pantry with a large servants' hall, which is also fitted for pantry purposes for entertaining, and the like. Throughout the basement white tiles have been used and blue paint, whilst all kitchen fittings are teak-topped and copper-lined.

Of specialists' work in the building, we would notice that the whole of the electric-light work, with fittings, also the hot-water appliances for heating and the hot and cold water services are by Messrs. STRODE & Co., whilst everything else, including decorative work, was undertaken by the general contractors, Messrs. TROLLOPE & SONS, working under Mr. SACHS's instructions, Mr. SACHS being represented by Mr. LISTER, his manager, and Messrs. TROLLOPE by Mr. PARSONS.

As to the exterior of the building, an attempt has been made to modify its ugliness and bad proportions, and to frame the windows and openings with Italian mouldings, whilst the large surfaces are rough-cast. This, together with the aid of flower-boxes and later with creepers, at all events, makes the building a pleasing group to the eye, the new wing having done much to improve the general grouping of the building, which, with its loggia towards the sea, and terracing, makes quite a pretty picture, both from seawards and from the south. Unfortunately many of the sash-windows had to be retained, and thus the better effect of the casement-windows, particularly if divided into small squares, is lost.

In respect to the grounds in which the house stands, Mr. SACHS delegated the whole of the garden design to Mr. T. H. MAWSON, who, by terracing, created an English formal garden, which in due course should be a most picturesque adjunct to the property. The terracing, which also has a picturesque summer-house, some sun-dials, gates and other artistic features, certainly assists the general appearance of the building.

Perhaps we should here remark that the site of Walmer Lodge became the subject of considerable interest about a year ago, when, in the course of excavations, a number of

very valuable and fine specimens of Roman remains were found, including glass vases, terra-cotta work and coins. These have been carefully arranged, and now form an interesting exhibit in the principal hall of the building.

#### THE PUBLIC BENEFIT BOOT COMPANY'S PREMISES, TRURO.

THESE occupy a very commanding position at the corner of King Street and Boscawen Street in the very heart of the city, and where all the principal traffic converges. Upwards of 12 feet have been taken off the King Street frontage of the property for the purpose of street widening. The material used for the walling is best red facing with buff Ruabon terra-cotta dressings, and the contrast is an agreeable one in colour. The roofs will be of Delabole slate, and the works generally of a very solid and substantial description. The company to which it belongs are very enterprising, and have branches all over the country, with headquarters at Bristol and Leicester.

Mr. SILVANUS TREVAIL, P.S.A., of Truro and Palace Chambers, Westminster, is the architect, and Mr. WM. E. BLAKE, of Plymouth, is the builder.

#### CATHEDRAL SERIES.—HEREFORD: EAST END. SOUTH SIDE OF LADY CHAPEL.

#### QUEEN'S HOTEL, LEICESTER SQUARE: SMALL DINING-ROOM. TABLE D'HOTE ROOM.

#### LANSDOWNE SOLDIERS' HOME, LIMERICK.

#### THE SHANNON FACTORY, DALSTON.

THE Shannon Factory, which is being erected for The Shannon Company, Ltd., at Dalston, will be a model cabinet-making factory. It is to be opened in the early autumn, and is already practically complete.

It has been designed and executed under the personal supervision of Mr. EDWIN O. SACHS, who was assisted by his manager, Mr. LISTER, and latterly by his partner, Mr. S. HOFFMAN; Mr. KISSACK acting as clerk of works, and the general contractors being Messrs. HOWARD & Co., of Bow Street, Covent Garden.

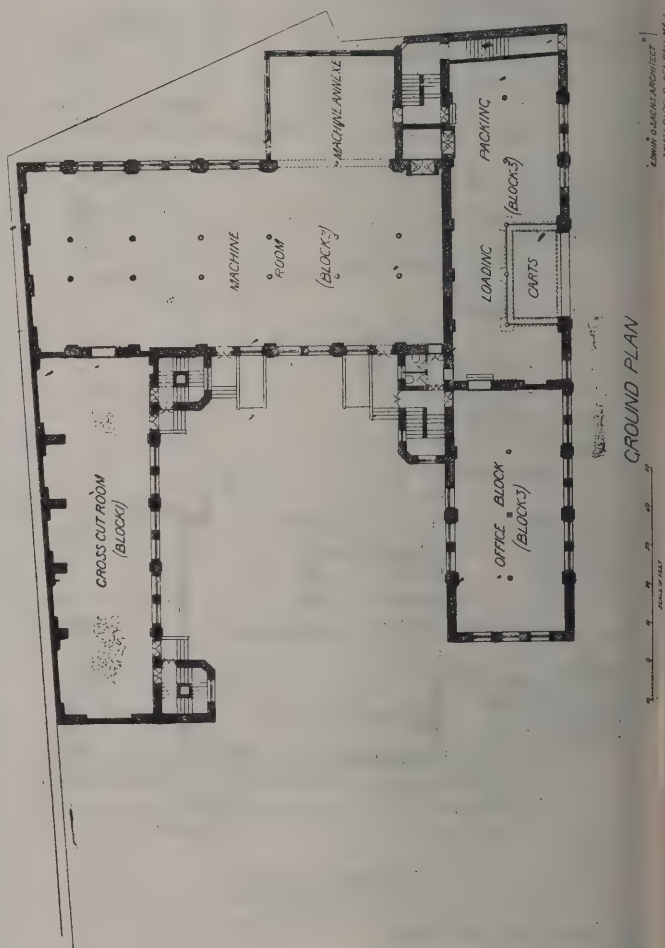

It is being equipped under the personal direction of the managing director, Mr. SCHAFER, in consultation with Mr. SACHS and Mr. RAVENSHAW, the latter acting as consulting electrical engineer. It embodies everything that is new in the best American and Continental practice, including a full equipment of modern American tools and machines, and much English plant on American models.

The purpose of the factory is the execution of first-class cabinetwork and the finer forms of joinery, as well as the general cabinet-making of the roll-top desk and other office utensils, with which the name of The Shannon Company, Ltd., has been so successfully associated, but in respect to which architects have certain prejudices on account of the American mouldings, which do not appeal to English taste, and which will now be almost done away with to make room for English work and designs.

The property taken by Messrs. The Shannon, Ltd., for their new factory and warehouse is at Dalston, close to Dalston Lane station, and is cut in two by a small street called Tyssen Street. The larger half of the site is now the scene of the present building operations, and this site measures 220 feet by 140 feet, and is almost rectangular in shape. Light is obtained in the aforesaid Tyssen Street on one side, from Tyssen Passage on the other, and as the land abuts on the Great Northern Railway, light is also obtainable from a third side.

The basis of the plan was the formation of a large central block, with two wings projecting, and thus forming

a semi-enclosed central court. Facing this court, but at the opposite end of the site, were to be placed the boiler-house, dry kilns and other minor adjuncts of the concern.

The main block has a basement 10 feet high, a ground floor 20 feet high, a first floor 20 feet high, a second floor 10 feet high and a third top-lighted floor. The west wing and east wing both have the same high ground floor, but the first floor is divided into floors of 10 feet high each, and thus a series of 10 feet floors are provided for.

The different blocks are separated by strong party walls and the various double iron doors required under the Building Act. Further, all the many provisions of the Factory Act have been most carefully acceded to, and in staircase accommodation, exit doors and emergency exits generally, there are few factories that can compare with this structure in the United Kingdom. The central block is particularly remarkable for the fact that it is just within the maximum limits of cubical contents that can be accorded in the county of London, and is hence, perhaps, the largest individual factory block in the Metropolis.

The Columbian Fireproof Flooring Company have had the construction of the floors, WENHAM & WATERS the

casements, the Crittall Manufacturing Company the iron doors, the Patent Impervious Stone Company the stone steps and general stonework. Fire-resisting floors have not only been used throughout, but the big columns, girders, &c., have been protected by 2 inches of concrete, and again, besides the constructional preventative measures, the entire blocks are being fitted with a sprinkler system.

Intercommunication between the different floors is by means of lifts, wells, cranes, as well as by the staircases. Conveniences for the staff are on every floor, and the west wing basement is devoted entirely to mess-rooms and dressing-rooms for the employes.

The actual division of the building into various workshops is not a matter that should be described at the moment, but it might be said that everything has been done to save unnecessary moving of material and to economise in labour. Runaways, trolley lines, &c., have amply been made use of.

Of the buildings facing the main structure, the boiler-house with its chimney 80 feet high is the most important, containing not only boilers, but also dynamo-rooms, &c., for creating the necessary power plant, the whole of the installation being worked by electricity.

Dust-removal contrivances, ventilation and heating apparatus are all on modern lines, worked from this central boiler-house.

The site that has been left vacant on the other side of Tyssen Street for the moment is the future location of a large warehouse for the company, which Mr. SACHS has so contrived as to materially assist the general *ensemble* of the group, particularly if permission can be obtained from the local authorities to arch over Tyssen Street.

As to exterior architectural treatment, an attempt has been made to follow the example so excellently set by Mr. ASTON WEBB in the design of his silos on the Thames, with the result that instead of obtaining the usual factory monstrosity, Mr. SACHS has been able to present a factory of architectural pretensions without in any way deteriorating the practical purposes of the building.

It is to be hoped that when the factory is completed it will be considered a suitable subject for a visit on the part of the Architectural Association and the other technical societies whose interest in model institutions leads them to make visitations, for both the design of the building and its equipment are highly instructive.

## THE NEWCASTLE SOCIETY OF ANTIQUARIES.

THE Newcastle Society of Antiquaries recently held their third outdoor meeting for the season at Morpeth and Bothal. Arriving at Morpeth station at ten o'clock, those present, under the guidance of Mr. R. Blair, one of the secretaries, drove to the parish church (St. Mary's), which stands on the Kirk, a hill about a quarter of a mile south-west of the town. Mr. Blair read a letter from Canon Bulkeley, rector of the parish, in which he stated the recent changes in the fabric, the chief being the carvings of the corbels in the chancel. Mr. Knowles gave a succinct account of the architectural features of the church, which, he said, for beauty of situation and its good state of preservation was one of the finest parish churches in the north. A visit to St. Mary's, Morpeth, was at all times a refreshment and inspiration.

Canon Walker Whalton followed with interesting remarks upon the purely ecclesiastical history of the church.

The Rev. the Hon. W. C. Ellis, rector of Bothal, said there were parallels between Morpeth Church and his own at Bothal in respect to their north arcades, the remains of old paintings on shafts of the arches, a low side window, and a squint or hagioscope. At Bothal they had the smallest squint known. Leaving the church they went to Morpeth Castle, and from thence to Morpeth town hall, where the mayor (Alderman Young) received them. They were shown Belted Will's mace, the corporation punch bowl and ladle, the mayor's gold chain, the corporation snuff-box and the branks, an iron instrument wherewith women scolds were publicly punished. In the clock-tower they saw the rope with which bulls were fastened to the ring in the Market Place when they were baited, it being a local law that no butcher should kill a bull until he was publicly baited. Others went to the town clerk's house and saw the town's hutch. The party then drove by way of Hebborn to Cockle Park Tower and thence to Bothalhaugh, the residence of the Rev. and the Hon. W. C. Ellis, who

entertained them to lunch. On the motion of Canon Walker, seconded by Mr. Hindmarsh, F.L.S., Alnwick, a cordial vote of thanks was conveyed to Mr. Ellis for his hospitality. He then guided them through the pleasure grounds by the banks of the Wansbeck. They proved a veritable world of arboricultural, agricultural and floral wonders, every region of the globe having been called upon to contribute to the endless variety of tree, shrub and herbaceous plant. Mr. Ellis supplied each of his guests with a printed account of his parish church of St. Andrew, and supplemented it with a verbal description of such features as were not included in it. He also described the architecture and heraldic shields of Bothal Castle, and with a further walk along his new carriage drive and cycle track, by the side of which British burials were pointed out, a delightful and instructive outing was brought to a close.

## SOMERSET ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the Somerset Archæological Society was held this year in Glastonbury, under the presidency of the Dean of Wells. According to the annual report there are 601 members. In the course of the year a valuable collection of Roman and Mediæval antiquities, the gift of Mr. W. W. Walter, had been received. Other presents were obtained.

### *The President's Address.*

After the conclusion of the business the Dean of Wells gave his inaugural presidential address. Little need be said, he commenced, to so cultivated an audience as this regarding the claims of archæology or the study of antiquity. Man must ever be interested in the antiquity of man, and the date of man must be carried further back than seventy years ago had been imagined. Wookey Hole alone, which Professor Boyd Dawkins explored in 1859, would convince them of that, there having been found there a mixture of implements wrought by human hands along with the bones of animals long extinct in Europe—the rhinoceros, the elephant and the cave-bear, most notably. But the evolution of man and man's civilisation, the identity of man in the midst of constant development, the day of small things, the cave-dwellers of that day slowly changing to be the present wielders of steam and steel and masters of electricity, magnetism and wireless telegraphy, must deeply interest every active mind. Physically considered, the double land-bridge between Europe and Africa—one by Gibraltar and the other not less surely by Tunis, Sicily and Italy—the breaking of the double land-bridge, and the cutting off of elephant and rhinoceros from retreat to their southern home, could hardly fail to rouse even a sluggish imagination.

Turning to Glastonbury and its environs, the Dean said Glastonbury was acknowledged to be the very cradle of British Christianity, and later on it was the one great religious foundation which lived through the Norman Conquest, and in which Briton and Englishman have an equal share, as Professor Freeman had said again and again. It was the first Benedictine monastery founded in England on the lines of the first Benedictine home for monks founded A.D. 50 by St. Benedict himself, close to Subiaco, overhanging the sparkling waters of the upper Anio, close to the site of the villa of Nero, who had dammed up the Anio to form a lake. The church of Glastonbury was an abbey church, but it surpassed in scale and grandeur almost every cathedral church in England. It just equalled in length the 500 feet of Canterbury Cathedral, including Becket's Crown at the eastern end.

The British village,  $1\frac{1}{4}$  mile distant, was unique in the three kingdoms, he believed. It was also quite unlike the pile-houses of the Swiss lake villages, where he (the Dean) dredged thirty years ago. He had hoped Mr. Arthur Bulleid might have been there that day, for it was he who, on the inspiration of Bishop Hobhouse, followed up the abbot's waterways, and came to the field with sixty-six flattened tumuli, oval in shape. The generosity of the late Mr. Edward Bath at once permitted free excavation, and eventually he gave to the Glastonbury Antiquarian Society five acres of ground on which the village with its river quay stands. The contents that were worth extraction were mostly in the Glastonbury Museum, sorted exquisitely out of many tons of soft brown peat by the deft fingers of Mr. Arthur Bulleid. The museum was a model of what a local museum should be, and showed how apparent obliteration meant sometimes gentle preservation—how the water-logged vegetable mould in Somerset might embalm plain relics of hard primitive life as effectually as at Herculaneum and Pompeii dry volcanic ashes enshrined dainty surgical instruments with the mirror of the belle, the razor of the beau and the batterie de cuisine of the gourmet. He would end with a word about a great favourite of his—

Meare. The chancel of the church at Meare was built by the same abbot who built the Manor House and the Fish House there, Adam de Sodbury, fully 570 years ago, but the nave was about a century and a half later. About forty years ago there lay in a chest in Meare Church the armour of fifteen men whom the abbot furnished for the king's need. Putting aside palaces and castles, he could think of no village in England that possessed two houses of such great interest as unaltered specimens of the Middle Ages as that Manor House and that Fish House. They were older than the Order of the Garter, older than Windsor Castle, only a century and a half later than the still existing lady chapel at Glastonbury, a century and a half later than the completion of the beautiful north porch of Wells Cathedral, or the commencement of its great west front. The Manor House was a real manor house, where the lord resided for a while and met his people on business. The hall possessed noble windows and a noble fireplace, still remaining. The Fish House sadly needed a roof, and he hoped the meeting would not break up without undertaking to collect funds to roof, fitly and strongly, that interesting structure.

The Rev. H. H. Winwood moved a hearty vote of thanks to the Dean for his address.

The Rev. Prebendary Grant, in seconding the motion, gave on behalf of the Glastonbury Antiquarian Society a cordial welcome to the visitors, and expressed the hope that they would have a happy, pleasant, and instructive meeting.

The motion was carried with acclamation, and, after the Dean had replied, the meeting adjourned.

After luncheon, which was held at the George Hotel ("Ye Olde Pilgrimage's Inn"), itself one of the architectural features of Glastonbury, connected with the abbey, visits were paid to the various objects of interest in the town.

St. John's Church was the first place visited. Canon Scott Holmes, who gave a brief account of the imposing edifice, said it had very little history. The original Norman church was undoubtedly cruciform, with a central tower. The church was entirely pulled down by Abbot Selwood in 1456, who rebuilt it, and placed the tower at the west end. Some of the piers of the nave rested on the piers of the central tower. The screen ran right across the church and both aisles, enclosing the transepts. There was a fine tomb to a chapman of the abbey. The glass, although very beautiful, was nearly all modern, the exception being some in the south-eastern window of the sanctuary. Outside, on the north wall, were two mortuary crucifixes. The tower was one of the most elaborate in the county, but the ornament, not being structural, was not pleasing to severe critics. It was strange that the Abbot should build so fine and beautiful a church so near the abbey.

Colonel Bramble observed that he looked upon the church as a glaring instance of endeavouring to do away with solid work altogether. There was very little to support the superstructure.

The Rev. H. L. Barnwell (the vicar) gave some additional information regarding the church, particularly as to the restoration.

Mr. E. Buckle, hon. diocesan architect, pointed out several of the peculiar features of the church, and directed attention to the curious cusping in the bottom series of lights of the east window.

Prebendary Daniel spoke of the altars. Besides the high-altar, there were three altars, which were dedicated to St. Mary, St. Nicholas and St. George.

Still under the guidance of Canon Holmes, the party proceeded to the Abbot's kitchen, a unique structure with four large fireplaces, commenced by Abbot Fromund in the time of Edward I., and finished by John de Breynon in the time of Edward III. The only other Mediæval kitchen of the kind was at Stanton Harcourt, some few miles from Oxford, which was, however, of a later date than Glastonbury, though on much the same principle.

Canon Holmes next took the party to the famous abbey ruins, and gave them some valuable information respecting them. The interest in the abbey consisted in its connection of English with British Christianity. The earliest historian, William of Malmesbury, spoke of four churches surrounded by the buildings of the abbey. Those churches owed their origin—the first to the disciples of St. Philip and St. James, the second to St. David, the third to some unknown disciples from Britain, and the fourth to St. Aldhelm and Ina. William of Malmesbury knew nothing of St. Joseph of Arimathea, but Arthur was to him an historic warrior of the ancient Welsh. What he said about the legendary Arthur and the Holy Grail was of later interpolation. When Dunstan was abbot, in the middle of the tenth century, he was said to have rebuilt all except the old church, so that by the time of the Conquest there were only two churches—the old *Vetusta Ecclesia* and Dunstan's church to the east of it. The old church seemed to centre in itself all the legends, which grew more definite as they were separated by time from the events connected with them. In the thirteenth century the Grail legends took definite form

and got woven into the Arthur legend, and definitely located at Glastonbury. In 1278 Edward I. paid a visit, and, wanting to find Arthur, he was, of course, dug up with the lead tablet describing the fact that "These are the bones of Arthur." In 1345 the Joseph of Arimathea connection with the Holy Grail and with Glastonbury Abbey reached its perfection of definiteness. John Blome, of London, obtained a license by patent roll to search for the remains of Joseph, and of course he found them; and from the end of the fourteenth century to the Dissolution the lady chapel at the west of the great church, formerly called the old church, became known in the popular mind as St. Joseph's Chapel. Let them account for the strange antiquity of the legends. Avalon and Glastonbury were later forms of a mythical pedigree of ancient Celtic lore. Avall and Galst were gods of the lower world, and gods of the lower world were connected with the fairy world. So the Island across the Summer Seas became to be known as the Glassy Island, the Island of the Fairies—Yngo-Wytryn.

Mr. Buckle also gave an address on the architectural features of the abbey. He believed that it was built by the Somerset school of masons about 1184, and finished off in the Early English style. Both the great church and St. Joseph's Chapel he believed to have been built at the same time, and he could only conceive that it was deliberately built in an older style than that of the times to give it an antiquated character. He did not believe that there was ever a vista right through from one end to the other. When the vaults under St. Joseph's Chapel were built in the fifteenth century the floor was raised to save excavating beneath the foundations.

A pleasant break occurred after the inspection of the abbey ruins, the visitors, at the invitation of Mr. and Mrs. Stanley Austin, partaking of tea on the lawn of the Abbey House, where a large garden party was congregated.

The Rural Dean of Glastonbury (Prebendary Grant) next conducted the party to the church of St. Benignus, of which he is vicar. He said that the church, now erroneously called St. Benedict's Church, was originally built and dedicated to the memory of St. Benignus. It was recorded of him by John of Glastonbury that he came from Ireland, and spent the closing years of his life at Glastonbury; that he died and was buried at Meare, probably about 470. In 1091 his remains were taken up, placed in a coffin, and carried by bearers to be buried in the great church at Glastonbury. The bearers halted at various stations on the way, and at the last resting-place an oration was delivered, setting forth the excellences of the saint; an appeal was made to the faithful, and offerings came in so liberally that a church was built upon the spot as a memorial of his piety. It was dedicated to St. Benignus by the Bishop of Bath, John de Villula, probably about 1100. King Edward VI. gave the rectories of St. John the Baptist and St. Benignus to the Bishop of Bath and Wells in exchange for several manors. In the town hall there was the original appointment of Jeffrey Strode to the curacy of St. John the Baptist by William Strode, with the chapelries of St. Benignus and West Pennard. It bore the date of 1663. Stephen Lane (1495) willed that Joan his wife, immediately after his decease, should find "a fit chaplain to celebrate in the chapel of St. Benignus, for the space of three years, for his soul, and the soul of John Lane, his father, and Margaret his wife, and all the faithful deceased." There was abundant evidence to show that the church was dedicated to St. Benignus, and that down to the middle of the seventeenth century it was called the church or chapel of St. Benignus or St. Benning's. The church was restored by Abbot Beere. He also added the north aisle. His initials, R.B., with the mitre, were over the north porch. There was a small chapel on the north side, called the Sharpham Chapel. In 1884 it was found necessary to restore it again, and a new aisle was added on the south side. The small chapel on the south side of the choir was built by the Rev. W. Alnutt, as a memorial to his daughter.

After giving his description of the church, the vicar of St. Benedict's (the Rev. Prebendary Grant) said he intended to commemorate the Society's visit to Glastonbury by reverting to St. Benignus as the name of St. Benedict's Church. It was, as he had said, originally dedicated to St. Benignus, but had gradually got to be called St. Benedict's, but as the church of St. Benignus it would in future be called.

The Rev. F. W. Weaver congratulated Prebendary Grant upon bringing the somewhat obscure St. Benignus back to his rightful domains. He also hoped that Mr. Grant would bring influence to bear on the borough authorities to also rename St. Benedict's Street and call it St. Benignus Street in harmony with the church.

Mr. Buckle and Colonel Bramble having spoken on the architectural features of the church, the party proceeded to the Glastonbury Museum. Alderman Morland described many of the curiosities and valuables there seen, and as they were mainly brought from the ancient British Lake Village he interweaved an account of what was known of that unique village. He said the settlement must date from about 2,000 years

ago. There were iron tools found, and these were certainly previous to the Roman occupation, and in their searches no Roman coins had been found. The village was built up in the midst of a shallow mere or pool, and it rested upon the peat common to all the levels, and there was a considerable accumulation before the village was built. The village was constructed partly of peat, clay and stone. The fact was the people built on an island, which was above the water except possibly in flood times. The huts were generally circular, built with wickerwork, and must have been fairly comfortable habitations. The people were by no means savages, but some puzzles existed in connection with the remains found. One puzzle was that there were remnants of primitive civilisation side by side with comparative luxury. In the museum they had got a few of the articles which people lost in their occupation, but everything they could take away it might be supposed they took away. They would see numerous cases of pottery, some built up by hand, others certainly burnt on the wheel, and ornamented with a considerable amount of art, in certain instances having patterns decidedly beautiful. The animals associated were interesting. The roe deer was there and the beaver was still in the land, and most likely had a great deal to do in baying back the water. There were twenty-six species of birds, ten of which were ducks. They found bones of the bittern, the coot, the puffin, the sea-eagle and the crane. More remarkable, the most abundant were bones of the pelican, as that had never been considered an English bird, and the nearest place now where they would find a pelican was the marshes of the Danube. The people had short-horned cattle, possibly two breeds. Horses were used for riding, and they had the remains of harness left. They had also traces of pigs and sheep. They were very clever with woodwork, able to cut out thin strips and decorate them with a kind of poker-work. There must have been considerable inland trade and foreign trade at the time, for there was a ring of amber and one of jet. As far as they knew, the people did not weave anything but wool, which they used for their clothing and fishing nets. They did not know whether that was merely an occasional place of refuge or a permanent one. It seemed scarcely possible that 300 people could live upon those five acres of land, without cultivating land elsewhere or feeding their flocks elsewhere. It rather looked as if the place was a refuge.

The Dean of Wells thanked Mr. Morland for the interesting address he had given.

The annual dinner was then held at the George Hotel, the President in the chair, time not permitting the inspection of the Abbey Barn, the Almshouses and the Tribunal.

At the evening meeting for the reading of papers in the Victoria Rooms, the Dean of Wells presided.

Prebendary Daniel gave particulars of the churchwardens' accounts of St. John's, Glastonbury. He quoted Mr. Bulleid's assertion that the churchwardens of St. John's held an almost unique position among the churchwardens of England, and for more than 600 years they had been a corporate body with a seal. At one time the wardens received 6s. 8d. annually, and about 1484 that amount was increased to 10s. 5d. for each, on account of their diligence. Many quaint entries in the accounts were mentioned by the speaker, among them being money received for letting out torches for funerals, letting seats in the church, and occasionally selling graves in the church. There were entries of sums received from plays acted. Some interesting particulars were given of the expenditure of the church funds. In 1500 they resealed the church and no craftsmen were to be had nearer than Bristol. David Carver undertook the work for 417, paid in two instalments; but with carriage, &c., the amount came to 657. David and two men accompanied the worked wood, which was put in boats at the Back. The boats proceeded to Rook's Mill, in the parish of South Brent. Thirteen boats hired at Meare brought half the load and thirteen waggons brought the other part from thence, the whole time occupied being a week. No point of general history came before them in the accounts, and he supposed all that concerned the country at large drifted towards the abbey and the people of St. John's were not concerned in it. The accounts, however, possessed an interest concerning the way in which the church was managed and the life of the townfolk.

Prebendary Grant furnished some particulars of Sir Edward Dwyer, of Sharpham Park, who lived in the reign of Queen Elizabeth. His career was of special interest to the people of Glastonbury, and he was one of those distinguished men whom Glastonbury was proud to own amongst her sons.

The Rev. E. H. Bates made some remarks respecting the publication of the first volume of the new history of Somerset, and whether the word "Somersetshire" was to be allowed in the prospectus. Many opposed it on the dictum of Mr. Freeman, but if there was any county "shired off" from anything else it was their county of Somerset.

The weather, although slightly overcast, was propitious on the second day, when, from the George Hotel, Glastonbury, the archaeologists set off in a long string of vehicles for an

excursion to Meare and Wedmore. There were nearly 130 ladies and gentlemen in the party.

A stoppage took place about a mile and a half from Glastonbury, in order that the field in which discoveries respecting the interesting lake village had been made might be visited.

When the party had assembled on the site, Mr. Morland said he had been trying to reconstruct what the country was like before any of the timber they saw exposed was brought there. On one side it was bounded distinctly by the hills of Glastonbury, and between these he believed the river Brue was found. He thought the Brue helped to form the boundary before men took to cutting straight courses for rivers. On the other side there stretched five or six miles of water or lake, which gave the name to Meare. That lake appeared on successive maps always contracted in size, and finally it was drained, and the site became pasture ground. It was bounded on the other side by narrow hills, so that they had an area which was practically a shallow lake.

After the different excavated spots in the field had been inspected, and remarks made by Mr. Morland and Mr. St. George Gray, the party re-entered their vehicles and were driven to Meare.

The Fish House here first claimed attention. Mr. E. Buckle, who described the building, said it was very remarkable. It was a small house of the fourteenth century, and was almost perfect. The building was traditionally called the Fish House, but so far as he knew there was nothing documentary to identify it in any way. It, however, seemed a reasonable enough description. The house stood on the edge of a lake, and they knew that the chief fisherman to the monastery lived at Meare, and was one of the most important of the chief servants of whom they heard accounts from time to time in the records. That was supposed to be the house in which he lived and the building which formed his office. It had the peculiarity that there was no internal communication between the ground floor and the upper floor. The ground floor seemed to have been for the business department, keeping fish tackle, &c. The front door of the house was on the upper stage, and a flight of stone steps presumably led up to the door. The upper part of the house consisted of two rooms, a hall, which was the principal one, and a small room at the end. The structure was a fine example of a superior cottage of the seventeenth century. There was an appendage at one end which has disappeared, and there were signs of that little addition to the house.

Much interest was evinced in the Manor House, and the party, having ascended the stairs, found themselves in a fine hall. The house had belonged to the Abbot of Glastonbury, and as in those days the country was very moist the abbot lived upstairs, like the head fisherman. A magnificent fireplace was noted. The Rev. F. W. Weaver gave a few particulars of the building.

When the party had made their way to the church Mr. Buckle furnished a description, saying that the church belonged to two principal periods. The chancel was a great deal older than the nave, and was fourteenth-century work. There was a great deal of interest about the tracery of the windows. The architect was certainly a person of original mind. He had some idea of the direction in which the architectural style was tending at that time, and there was a little touch of the Perpendicular put in on the top of a purely Decorative window. The roof of the chancel was a little peculiar; it was so palpably that of a hall and not a church.

The Rev. B. T. Bussell (vicar) read a paper on the history of the parish, and subsequently the party drove to Wedmore, where the church and cross were inspected, and Mark Church was included in the day's programme.

On the Thursday, in threatening weather, but which held fairly fine all day, the archaeologists left Glastonbury at half-past nine for another day's excursion. By way of Northload Park, the party soon arrived at Ponter's Ball, Havyatt, an old earthwork, presumably made to defend Glastonbury from anything from the east. When it was thrown up the ground all round, except the narrow isthmus on this side, was all morass, so that the construction of this earthwork made Glastonbury perfectly safe from attack. It is thought to be more ancient than Roman, and that it dates back to very early times indeed. The field is 5 or 6 feet higher than the next field towards Glastonbury, leading to the belief that there was once a village close by, protected by the fortress.

The party next drove to West Pennard Church, dedicated to St. Nicholas. The tower is very massive, built about the time of Edward IV., and showing very distinctly the best type of Perpendicular work. There are carved angles in a string-course over the doorway of very beautiful design, and the arrangement of niches on either side of the west doorway and higher up in the tower is a characteristic feature of Somerset towers. In the interior is a beautiful sixteenth-century rood-screen and a characteristic Somerset nave ceiling. The wide easternmost arch obviously originally opened out into a chantry chapel, screened off from the nave, with a squint at the south

side of the chancel arch. In the churchyard is a beautiful cross, consisting of an octagonal base of four steps, with a square socket, containing sunk panels, sculptured in relief, on three sides of which are emblems of the Crucifixion, on the north side being the initials "R.B." under an abbot's mitre, said to be those of Richard Beere, abbot of Glastonbury, 1493 to 1524, who is supposed to have erected the cross.

West Bradley Church was next visited, a small and unpretending building, with a tower of plain design dating rather earlier than West Pennard, as shown by the plain, unpierced parapet. The drive was next resumed to Baltonsborough Church, dedicated to St. Dunstan, who is supposed to have been born here. For a Somerset church this is peculiar, consisting of a nave wider than usual without aisles. There are several interesting Mediæval gable crosses in a fair state of preservation, and on the north side of the church the rood-stair turret still remains. There is a very rich Mediæval drop ring handle and escutcheon to the south door, and the massive Mediæval bench ends with fifteenth-century mouldings are very interesting.

Butleigh Church was then visited. This was originally dedicated to St. Benedict, but now called St. Leonard's. It is also believed to have been dedicated to the two St. Johns, emblems of both having been discovered in the church.

On leaving Butleigh the party proceeded to Street, stopping en route at Ivythorne Manor House, a summer seat of the abbots of Glastonbury. At Street they were entertained at Mill Field to tea by Mr. W. S. Clark, J.P., C.A., and they also inspected Street Geological Museum, under the guidance of Mr. Horace Woodward, the renowned geologist and keeper of the Geological Department of the British Museum. The Museum of British Birds at Street was also inspected, and this concluded the annual meeting of 1902.

We are indebted to the *Bridgwater Independent* for the report.

### THE IRISH VALUATION SYSTEM.

A SELECT Committee of the House of Commons appointed to inquire and report what changes in the Irish Land Valuation Acts are desirable in order to enable a revaluation of rateable property in any district to be made on a basis equitable to all classes of ratepayers, and to be brought into force in an effective manner, met under the presidency of the Lord Advocate, Mr. Graham Murray, for the purpose of hearing the evidence of Sir John Barton, Commissioner for Valuation in Ireland.

Sir John Barton, who had previously furnished the committee with a statement as to the history, method and practice of valuation for rating purposes in Ireland, was examined upon it at some length by the chairman, who, passing over the "questions of historical interest such as the first and second Government valuations," desired to come more particularly to the third, or current, method of valuation. Asked how "prices" entered into the mode of valuation, witness explained, says the *Irish Times*, that they represented the average obtained for agricultural produce taken from some forty fairs in Ireland during the three years immediately preceding the passing of the Valuation Act. The reason he understood that this scale was laid down as a basis on which the land valuation was to be made was to insure uniformity. Of course the prices of agricultural produce changed a good deal, and a scale was laid down as a basis on which was calculated the valuation of every holding. The valuation of the country took a long time to complete, the last, or Griffith's valuation, occupying from 1830 until 1865.

The Chairman: When the valuer gets a certain field, say, which is capable of growing a certain crop, he is directed to value not upon the assumption that the crop will fetch the price of the day, but the price shown in the scale, and by those means you get uniformity over the country?—Yes, that is so.

But although that is given as a guide, the real criterion—the real method of valuation—depends upon the skill of the man who determines what the land would bring in in the way of certain produce?—Yes.

Under the system pertaining in Ireland there is no revaluation in the strict sense of the word?—No, not in the strict sense.

The valuation lists are delivered every year, but there is no officer charged with the duty of altering them, even if an alteration seems desirable?—My duty is to revise the lists sent to me by the rating authorities of the rateable hereditaments which they consider require revision in valuation.

I accentuate that, because when we come to the systems of other countries it is quite conceivable that you might put upon an official the duty of revaluing each year if you thought there was necessity for revaluing. The result of this obviously under the present system with respect to land is that the valuation is very much out of date.

Witness said that was so, because these valuations were

made upwards of forty years ago. He believed there was a general consensus of opinion in Ireland that a revaluation was most desirable. At present there was no power to make any alteration in the value of land, but there was some power to make alterations in the valuation of buildings.

The Chairman: Is it the case that the reason why each year there is so great a discrepancy between the proportional relations as to the valuation of lands and of hereditaments is that under statute it is not possible to alter the valuation of lands, while there is power to alter the value of other hereditaments?—That is so.

Although the valuation of land is practically stationary, the value altered considerably since the date of the last valuation?—Yes, in many districts.

Improvements, drainage and so forth will, I suppose, cause land to appreciate in value, whilst, on the other hand, you will find considerable depreciation?—Yes. Depreciation following flooding and stoppages of drains and from similar causes.

Has there been practically a difference in the alertness of the different rating bodies in various parts of Ireland on the question of bringing under the notice of the valuer possible revisions?—Yes, in some districts, but especially in towns. There has been a feeling ever since the valuation was made that where no structural changes have occurred valuation would not be revised.

Questioned on the point of railways, Sir John Barton said railways had risen in value in Ireland during the last thirty or forty years. In many cases the receipts had doubled, but no revaluation had taken place, though, perhaps, to some extent, that had been rectified in recent years. Witness, continuing, explained that bills to effect revaluation had been unsuccessfully introduced in 1865, 1873 and 1877. But in the Local Government Act, 1898, there was provision for the revaluation of six county boroughs in Ireland if the rating authorities interested asked for it and agreed to pay a portion of the cost. The only two county boroughs that had made use of that option were Belfast and Dublin. It was to the interest of the rating authority to keep the valuation high so as to admit of low rate of poundage, and as a natural consequence they obtained a large amount of rating and borrowing powers, whereas, on the other hand, it was generally the desire of the individual ratepayer to keep the valuation low. In his opinion the Irish system should continue to be a central system. Witness explained that the principal advantages of a central system were that they had values in every part of the country in exactly the same position; that they were disinterested in making the valuation high or low; the work was carried out under a set of instructions, and if they did not think those instructions covered every case they referred it at once to the Central Office, with the result that there was a uniform system of valuation throughout the whole country. Another great advantage was that they had in the Central Office tables of the original valuation of every holding, details of how it was valued, particulars of soil and subsoil, and every change made in the valuation since 1850. This system of reference was used very much by the public and by the courts.

In your view, is there any sound reason for valuing land and other hereditaments on a different basis?—I do not think so. They should be valued on the same basis. The basis of the land valuation ought to be the letting value, as was followed in both England and Scotland.

You must consider the different position of Irish land—I mean in the relations of landlord and tenant as differing from the position of land in England and Scotland?—That is so. Large amounts of rent have been fixed in Ireland by statutory tribunal.

Just tell me your view as to how you should address yourself to the problem of valuing land in Ireland, the rent of which is fixed by a statutory tribunal?

Witness said the difference between the sum which was set down as the rent of the holding if it were in the landlord's hands and the fair rent was the interest in the tenant's expenditure on improvements, such as buildings, making drains and fences. It seemed to him that in cases where the Land Commission had first named the sum the value of the holding in the landlord's hands, that sum, with some modifications, might be taken as the rateable value. He also thought that lands on which rents had not been fixed ought to be valued on practically the same basis; that was to say, in certain districts there might be half a dozen holdings. It would not be hard for a valuer to know how far land adjacent to them was of a similar quality. In that way he could arrive at an equitable valuation.

That system would be reasonably effected if you begin your valuation of Ireland with the towns, leaving the country last?—That is so. The Ordnance Survey are preparing a survey on a 25-inch scale, and they have only done a portion of it now. When that is complete it will facilitate our work, because one of the most important things in valuation is to check the boundaries of every holding.

Why in your opinion would it not do to take the fair rent a

fixed as representing the value?—For this reason. It is most desirable, in fact, necessary, that the value of houses and land should be made on the same basis. The value of land as set out in the fair-rent schedule does not include all that is rateable in the holding. It only includes one interest—the other interest is rateable, and therefore ought to be included.

The tenant's fair rent is what he has got to pay his landlord. He does not pay anything for his own property, and the idea of the tenant right is that the tenant has a certain amount of property, which is his interest in the holding.

Mr. Lough: The landlord's interest is that he gets the rental which the tenants pay, so there can be no second interest.

The Chairman: It is necessary, in your view, that in any equitable system the true basis of valuation of all hereditaments should be the same, whether they happen to be such hereditaments as can have a rent fixed for them by a statutory court or such as cannot?—Yes.

And therefore, if you take the mere fair rent as representing value, that would be an injustice to the person who has a town holding upon which the fair rent cannot be fixed by statutory tribunal?—I think so.

Witness, in further examination, expressed the view that in any system of revaluation they should begin with the towns where the most glaring inequalities existed.

Now, about the valuation of the value that is represented by licenses?—In Ireland up to the present the increased value of a license is not taken into account in arriving at a valuation.

What is your idea of the way in which the question could be dealt with?—It is that these licenses should be taken into account as in England and in Scotland. I think it is an injustice to the other ratepayers that they are not.

I think your exemption law in Ireland is in a very different state to what it is in England and Scotland?—It is. In Ireland it is held that the words "public purposes" occurring in the Valuation Acts have a much broader meaning than in England or Scotland—take, for instance, the Londonderry Bridge case—with the result that a very large amount of property is exempt in Ireland that would not be exempt in the other countries, such as the property of harbour commissioners, public offices, lunatic asylums and property of that kind. In the same way, with regard to charitable institutions, the meaning is taken in a much broader sense in Ireland, and a great many institutions are exempt there which would not be exempt here.

You think that any legislation should deal with exemptions?—Yes.

In your view, in any new valuation should the old exemption be taken away, and a new and somewhat restricted exemption be provided for?—Certainly, on public grounds, and, possibly, in regard to charities.

Would you suggest that anybody else except rate-collectors should be allowed to put cases into the lists for revaluations?—The Excise authorities should be allowed.

Would you give discretionary power to local authorities to remit valuation for a certain period upon structural works so as to encourage building improvements?—I think that would be very desirable, otherwise it might act as a deterrent to building improvements, and I would suggest that the full valuation should not be imposed until three years had elapsed after completion. The valuation might be increased by one-third in each of these years until the maximum was attained at the end of the third year.

Would you desire periodical revaluation?—Yes, every thirty years in the country and every twenty in the towns, except when the towns progress at a rapid rate, and then the rating authority should have power to ask for revaluation every ten years.

It has been suggested that a rise in the valuation would prejudicially affect Ireland in the matter of income-tax?—It would to some extent.

This concluded Sir John Barton's direct examination, and the committee adjourned until the autumn session, when he will be recalled for cross-examination. It is understood that the next witness will explain to the committee the variations in the English and Scottish systems of valuation.

## TESSERÆ.

Verrio, La Guerre and Thornhill.

WHEN the mason and carpenter and plasterer had done their work, the painters made their appearance, and covered walls and ceilings with mobs of the old divinities—nymphs who represented cities, crowned beldames for nations, and figures, ready ticketed and labelled, answering to the names of virtues. The national love of subjecting all works to a measure and value price, which had been disused while it followed nature and dealt in sentiment, was again revived, and these cold, mechanical productions might be paid for in the spirit which conceived them. The chief apostles of this

dark faith were two foreigners and one Englishman—Verrio, La Guerre and Sir James Thornhill. Rubens, indeed, and others had deviated from nature into this desert track, only to return again to human feelings with a heartier relish; but Thornhill and his companions never deviated into nature. The shepherdesses of Sir Peter Lely were loose in their attire, loose in their looks, and trailed their embroidered robes among the thorns and brambles of their pastoral scenes in a way which made the staid dames of the Puritans blush and look aside. But the mystic nymphs of Thornhill or La Guerre, though evidently spreading out all their beauties and making the most of their charms, could never move the nerves of a stoic. It is in vain that a goddess tumbles naked through a whole quarter of the sky. It is astonishing how much and how long these works were admired, and with what ardour men of education and talent praised them. Thornhill enjoys all the advantage of the praise of Pilkington, and the approbation of Lord Orford. "His genius," says the former, "was well adapted to historical and allegorical compositions. He possessed a fertile and fine invention, and sketched his thoughts with great ease, freedom and spirit. He was so eminent in many parts of his profession that he must for ever be ranked among the first painters of his time." "Sir James Thornhill," says Walpole, "a man of much note in his time, who succeeded Verrio and was the rival of La Guerre in the decorations of our palaces and public buildings, was born at Weymouth, in Dorsetshire; was knighted by George I., and was elected to represent his native town in Parliament. His chief works were the dome of St. Paul's, an apartment at Hampton Court, the altarpiece of the chapel of All Souls at Oxford, another for Weymouth, of which he made them a present; the hall at Blenheim; the chapel at Lord Orford's, at Wimpole, in Cambridgeshire; the saloon and other things for Mr. Styles, at More Park, Hertfordshire; and the great hall of Greenwich Hospital. Yet, high as his reputation was, and laborious as his works were, he was far from being generously rewarded for some of them, and for others he found it difficult to obtain the stipulated prices. His demands were contested at Greenwich, and though La Fosse received 2,000*l.* for his works at Montague House, and was allowed 500*l.* for his diet besides, Sir James could obtain but 40*s.* a square yard for the cupola of St. Paul's, and I think no more for Greenwich."

## Roman Sundials.

The first sundial with which the Romans became acquainted was, according to some writers, brought to the city by Papirius Cursor twelve years before the war with Pyrrhus, and placed before the Temple of Quirinus. Others state that it was brought to Rome at the time of the first Punic war, by the consul M. Valerius Messala, and erected on a column behind the Rostra. But this solarium being made for a different meridian did not show the time at Rome correctly. Ninety-nine years afterwards, the censor Q. Marcius Philippus erected by the side of the old solarium a new one, which was more carefully regulated according to the meridian of Rome. But as sundials, however perfect they might be, were useless when the sky was cloudy, P. Scipio Nastica, in his censorship, 159 B.C., established a public clepsydra, which indicated the hours both of day and night. This clepsydra was in aftertimes generally called solarium. The word hora for hour was introduced at Rome at the time when the Romans became acquainted with the Greek horologia, and was in this signification well known at the time of Plautus. After the time of Scipio Nastica several horologia, chiefly solaria, seem to have been erected in various public places at Rome. A magnificent horologium was erected by Augustus in the Campus Martius. It was a gnomon in the shape of an obelisk; but Pliny complains that in the course of time it had become incorrect. Another horologium stood in the Circus Flaminius. Sometimes solaria were attached to the front-side of temples and basilicæ. The old solarium which had been erected behind the Rostra seems to have existed on that spot till a very late period, and it would seem that the place was called ad Solarium, so that Cicero uses this expression as synonymous with Rostra or Forum. Horologia of various descriptions seem also to have been commonly kept by private individuals; and at the time of the emperors the wealthy Romans used to keep slaves whose special duty was to announce the hours of the day to their masters. From the number of solaria which have been discovered in modern times in Italy, we must infer that they were very generally used among the ancients.

## Proportions of Rooms.

As all roofs are supported by the side walls, and composed in general of the uniform material of wood, there is a certain though not a very precise limit which we impose to their breadth, from our knowledge that if they pass this limit they are insufficient and insecure. To the length and to the height, on the other hand, we do not impose any such rigorous limits, because neither of these proportions interfere materially with our opinion of security. Within this limit of breadth there may

be several proportions to the length and height which shall be universally pleasing. But beyond this limit these proportions cease to be pleasing and become painful in the same degree that they pass this boundary of apparent security. Thus a room of 12 feet square may constitute a pleasing form, but a room of 60 feet square would be positively disagreeable. A room 24 feet in length by 18 in breadth may be sufficiently pleasing, but a room 60 feet in length by 50 in breadth would constitute a very unpleasing form. Many other instances might easily be produced to show that the beauty of every apartment depends on the appearance of proper support to the roof; and that on this account the same proportion of breadth that is beautiful in one case becomes positively painful in others. Another cause of this difference in our opinion of the beauty of proportion arises from the character of the apartment. Everyone must have observed that the different forms of rooms, their difference of magnitude and various other causes give them distinct characters, as those of gaiety, simplicity, solemnity, grandeur, magnificence, &c. No room is ever beautiful which has not some such pleasing character. The terms by which we express this beauty are significant of these characters, and however regular the proportions of an apartment may be, if they do not correspond to the general expression, we consider the form as defective or imperfect. Thus the same proportion of height which is beautiful in a room of gaiety or cheerfulness would be felt as a defect in an apartment of which the character was severity or melancholy. The same proportion of length which is pleasing in an elegant or convenient room would be a defect in an apartment of magnificence or splendour. The great proportion of breadth which suits a temple or a senate-house, as according with the severe and solemn character of the apartment, would be positively unpleasing in any room which was expressive of cheerfulness or lightness. In proportion also as apartments differ in size different proportions become necessary in this respect, to accord with the characters which the difference of magnitude produces. The same proportion of height which is pleasing in a cheerful room would be too little for the hall of a great castle where vastness is necessary to agree with the sublimity of its character, and the same relation of breadth and height which is so wonderfully affecting in the Gothic cathedral, although at variance with all the classic rules of proportion would be both absurd and painful in the forms of any common apartment. In general it will be found that the great and positive beauty of apartments arises from their character; that where no character is discovered the generality of men express little admiration even at the most regular proportions; that every difference of character requires a correspondent difference in the composition of the dimensions, and that this demand is satisfied or a beautiful form produced only when the composition of the different proportions is such as to produce one pure and unmingled expression.

#### Miniature Painting.

It is a mistake to suppose that a miniature is more finished than an oil-picture. The miniature is inferior to the oil-picture only because it is less finished, because it cannot follow nature into so many individual and exact particulars. The proof of which is that the copy of a good portrait will always make a highly-finished miniature, whereas the copy of a good miniature, if enlarged to the size of life, will make but a very sorry portrait. Several of our best artists who are fond of painting large figures, invert this reasoning. They make the whole figure gigantic, not that they may have room for nature but for the motion of their brush (as if they were painting the side of a house), regarding the extent of canvas they have to cover as an excuse for their slovenly and hasty manner of getting over it, and thus, in fact, leave their pictures nothing at last but overgrown miniatures, but huge caricatures. It is not necessary in any case (either in a larger or smaller compass) to go into the details so as to lose sight of the effect and decompound the face into porous and transparent molecules, in the manner of Denner, who painted what he saw through a magnifying-glass. The painter's eye need not be a microscope, it should be a looking-glass, bright, clear, lucid. The little in art begins with insignificant parts, with what does not tell in connection with other parts. The true artist will paint not material points but moral qualities. In a word, wherever there is feeling or expression in a muscle or a vein, there is grandeur and refinement too.

#### GENERAL.

**The Last Coping-stone** of the Nile dam at Assouan was laid on the 30th ult. The total length is about 1½ miles; the maximum height from foundation is about 130 feet, and the total weight of the masonry is over 1,000,000 tons. It can contain over 1,000,000,000 tons of water. The work has been carried out by Sir John Aird & Co.

**M. André**, the French artist, has undertaken to restore the *Hermes* of Cythera for the sum of 20,000 francs.

**The Palace** in the Wilhelmstrasse, in Berlin, recently rendered vacant by the death of Prince George of Prussia, is to be pulled down to make room for a new palace for the German Emperor's third son, Prince Adalbert.

**M. Picard** has completed the last of the five volumes of reports on the Paris Exposition of 1900. They contain over 200 views. The copies are to be presented to the foreign Commissioners, the Consuls, and other officials.

**M. Guilbert**, the architect of the chapel in Paris erected on the site of the bazaar which was destroyed by fire, has prepared plans for a chapel adapted to the Armenian rite, for which he has received a commission from a manufacturer in Tiflis. Inspiration for it has been drawn from the church at Akhtama.

**The Members** of the Royal Society of Painters in Water-Colours presented last week to their oldest colleague, Mr. William Callow, an illuminated address of congratulation on the ninetieth anniversary of his birthday. For sixty-four years Mr. Callow has been one of their most distinguished members, and holds the unique position of never having failed to contribute his share of drawings to each exhibition during that long period.

**M. Gaston Renault**, who is an artist as well as a topographer, is preparing a plan in relief of Paris, which will be placed in the Musée Carnavalet.

**The Board of Agriculture** will shortly undertake the management and control of Kew Gardens, the duties being transferred from the Office of Works.

**Examples** of old water conduits have been revealed in laying gas mains in Finsbury Pavement. They had been hollowed out to a bore of 6 inches or 8 inches, the trees in some cases being from 4 feet to 6 feet in girth. One end of each length had been pointed to fit into the hollow of the next, some of the trees being 20 feet or more in length. They are supposed to have been laid for the waters of the New River Company, from the reservoir at Clerkenwell to Finsbury Fields.

**A Site** for a marine zoological station has been offered to the University College of North Wales by Mr. G. W. Duff Assheton Smith, of Bangor. Mr. Harold Hughes has offered to act as architect without the payment of a fee.

**The Museum of Practical Geology**, Jermyn Street, will be closed as usual from the evening of August 8 until the morning of September 10 next.

**The New Recreation Hall**, Skerries, co. Dublin, was totally destroyed by fire on Monday night. It was opened a year ago and was designed by Mr. F. Shaw, architect.

**The Arbitration** on the amount of damage caused by fire to the Birkenhead town hall has cost in expenses 826*l*. The Corporation claimed 14,403*l*, and the insurance companies offered 5,038*l*. Sir W. Emerson's award was for 8,161*l*.

**The Poll** of the trustees of the Manchester Infirmary as to whether the new buildings should be erected on the site in Piccadilly has produced the following result:—For 199, against 550, thus confirming a previous resolution.

**Mr. Robert Pepys Cockerell** died in Liverpool on Wednesday last in his thirty-second year. He was the eldest son of the late Frederick Pepys Cockerell, and grandson of Professor Cockerell, R.A.

**The Art Congress at Bruges**, which is to be held in connection with the Exposition des Primitifs Flamands at Bruges, will take place between the 10th and the 14th inst. The subjects discussed will include archaeology, history and art.

**The Text** of the final order of the Court of King's Bench on the position of district surveyors as regards wooden stands and other structures is as follows:—Upon reading the questions submitted for the decision of this Court, under section 29 of the London Government Act, 1899, in the form of a special case agreed on between the parties, and upon hearing Mr. Manisty, of counsel for the Mayor, alderman and councillors of the city of Westminster and Mr. Macmorran, of counsel for Thomas Henry Watson, William Alfred Large, Robert Kerr, Edward Dru. Drury, Charles Foster Hayward, Alfred Williams and William Hewson Lees, district surveyors, acting under the London Building Acts, within the said city. This Court doth decide the said questions as follows videlicet:—(1) The powers, duties and liabilities of the district surveyors with respect to the supervision or inspection of wooden structures, falling under Section 84 of the London Building Act, have not been transferred to the City Council and its officers, but the district surveyors have no powers, duties or liabilities under the licenses granted by the City Council. (2) Wooden structures falling within the said Section 84 are works of which the district surveyors should have notice under Section 145 of the said Act in a proper case. (3) The right to receive the fees for such supervision and inspection, specified in paragraph 15 of the said special case, has not lapsed nor has it been transferred to the City Council or its officers.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**BERMONDSEY.**—Sept. 16.—Designs are invited for artisans dwellings to be erected on land at Rotherhithe, within the borough of Bermondsey, and known as the Fulford Street area. Premiums of 100*l.*, 60*l.* and 40*l.* will be awarded. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**BIDEFORD.**—Sept. 25.—The Town Council of Bideford are about to erect municipal offices and a public library upon a site opposite the west end of the Long Bridge, Bideford, and they invite designs for the proposed buildings. Premiums of 30*l.*, 15*l.* and 10*l.* respectively are offered for the designs which shall be placed by the Council first, second and third in order of merit. Designs and descriptions, &c., are to be delivered to Mr. Wm. B. Seldon, town clerk, 18 The Quay, Bideford.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford S.E.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**MAIDENHEAD.**—Oct. 1.—Designs for free library. Premiums offered of £50, £20 and £10 respectively. Mr. John Kirk, town clerk, Guildhall, Maidenhead.

**SOUTHEND.**—Sept. 7.—Designs are invited for a church to accommodate 500 persons, a clergy-house, and a parochial hall or parish-room about 50 feet by 30 feet. Mr. C. H. J. Talmage, Kathleen Villa, Southchurch Road, Southend-on-Sea.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**WALES.**—The Barry Urban District Council offer premiums of 150*l.*, 100*l.* and 50*l.* for first, second and third best designs respectively for proposed municipal buildings and public library on a site in the centre of the town. Mr. J. C. Pardoe, surveyor, District Council Office, Barry.

## CONTRACTS OPEN.

**ANDOVER.**—Aug. 14.—For erection of a steel girder and concrete bridge at Amport, and the laying of three cast-iron drains under the Andover and Amesbury main road, Andover. Mr. John Wormald, district surveyor, South Cottage, Andover.

**ASTON.**—Aug. 11.—For covering three boilers with about 800 yards of steam tubing at the workhouse, Gravelly Hill, near Birmingham. Mr. John North, clerk to the Guardians, Union Offices, Vauxhall Road, Birmingham.

**BARNES.**—Aug. 14.—For erection of a new infants' school for 350 children in Railway Street, Barnes. Mr. C. Innes, architect, 50 Cannon Street, E.C.

**BARROW-IN-FURNESS.**—Aug. 13.—For erection of buildings for an extension of the manufacturing plant at the gasworks, for the Corporation. The Manager of the Gas and Water-works.

**BILLERICAY.**—Aug. 12.—For sewerage works and the laying-out of about 2½ acres of land for sewerage and sewage disposal at Brook Street, near Brentwood. Mr. J. Simmons, engineer, Bank Chambers, Doncaster.

**BISHOP AUCKLAND.**—Aug. 11.—For alterations and additions to manager's house, colliery offices, stabling, &c., at Chilton Colliery. Mr. F. H. Livesay, architect, Bishop Auckland.

**BISHOP'S STORTFORD.**—Aug. 11.—For erecting boundary-wall 600 feet in length by 8 feet high at the gasworks. Mr. W. J. Gee, secretary, Water Lane, Bishop's Stortford.

**BOOTLE.**—Aug. 13.—For erection of a gymnasium floor over the gentlemen's swimming-bath, Balliol Road, Bootle, Lancs. Particulars may be obtained at the Borough Engineer's Office.

**BOSFRANKAN.**—Aug. 19.—For erection of a stable and wainhouse, &c., at Bosfrankan, Cornwall. Mr. George Gow, Tregothnan Office, Truro.

**BRIDGWATER.**—Aug. 11.—For construction of about 188 yards of new sewer with manholes, and the construction of

Fig. 9.

## NEW CATALOGUE.

AN admirably concise and businesslike catalogue has just reached us from the Empire Boiler and Engineering Co., Ltd., of Empire Works, Halifax. It contains some 150 pages of carefully compiled and fully illustrated letterpress, descriptive of the multifarious designs in boilers, for the manufacture of which this firm has established a reputation. Among the illustrations examples are to be found of boilers for every imaginable purpose, with their dimensions, heating power, cost and all other necessary information, and if by chance any special pattern may not be found in the pages, it will be quoted for immediately on receipt of inquiry, drawing, or model. In addition to purely catalogue information, the book also contains several pages of tables which will be found eminently useful to heating engineers, &c.

This company has recently erected extensive works adjoining the Great Northern and Lancashire and Yorkshire Railways, and which are at present carried on in conjunction with their city works, where the brass steam and water fittings are manufactured. The new works have been specially designed for the manufacture of welded and rivetted wrought-iron, steel and copper boilers, and have been equipped with modern machinery specially built for this business, the whole giving the utmost facilities for carrying out the various processes of manufacture expeditiously and economically, and at the same time insuring high-class work.

The whole of the machinery is electrically driven, no other motive power being employed, the works being equipped with a complete electrical installation—engines, dynamos, accumulators, &c. Each machine is fitted with its own motor, and is therefore independently driven, the necessary current being taken from the accumulators, whose capacity is sufficient to drive the machinery for forty-eight hours in the event of a breakdown, thus preventing any stoppage of the work. As soon as the additions to the new works are completed the offices and brassworks will be removed to them, thus bringing the whole of the various departments under one control, still further facilitating expeditious production, and making the Empire Works as complete as is possible for carrying out the work for which they are designed.

# ACETYLENE LIGHTING

LONDON, E.C.

ELECTRIC NOTES.

At Rugby Mr. A. A. G. Malet, Local Government Board Inspector, held an inquiry with reference to the application of the Rugby Urban District Council for sanction to borrow £9,000 for electric lighting purposes. Mr. T. M. Wratlaw, clerk to the Council, laid the proposed scheme before the Inspector.

THE London County Council has acquired a site for an electric tram station in connection with its new electric tram line from Westminster Bridge to Tooting, now in course of construction, conveniently near the Elephant and Castle. The site abuts on Dantzic Street, Parliament Street and Market Row. Operations for the building of the station will be begun on an early date, and it is expected that with the present rate of progress the electric cars will be running early next year.

THE supply of electricity to Birkdale by the Birkdale District Electric Supply Company, Limited, was inaugurated on the 1st inst. The cost of the station will be £30,000. It is situated at Shaftesbury Road, has three separate dynamos capable of giving an output of 220 amperes at 500 volts, and they will respectively develop a maximum of 220 kilowatts. At the conclusion of the ceremony lunch was served in the Palace Hotel. Mr. Weld Blundell, in responding to the toast of the Urban District Council, made an amusing onslaught on the modern developments of electricity and steam, such as the telephone and the motor car.

PROFESSOR CAPPER has sent in a report on the proposed electric installation for Dumfries. He was to advise the Council as to the best method of supplying the burgh with electricity (a) for lighting, (b) for lighting and tramways combined, and in particular whether it would be better to use gas or steam as a motive power. In making his calculations he takes the receipts from public lighting at 620%, and in the case of the tramways, he proceeds on the footing that the gross receipts would be 1,750%, his understanding being that the present receipts from waggonette traffic to Glencaple, which he puts at 200%, would be trebled. He recommends that the burgh should at once make the necessary agreements with the neighbouring local authorities to construct an electric tramway from Dumfries railway station to Glencaple, and that the burgh should also proceed at once to erect a generating station, so that it should be ready to supply current to lamps and tramways as soon as possible. The cost, with steam plant, would, he estimates, be 34,000% for lighting, or with con-

densing plant 1,000% extra. For lighting, plus tramways, 38,000%. With gas plant, the cost for lighting, plus tramways from St. Michael's Church to Glencaple, would be 39,150%, with a further cost of 19,000% for tramways from St. Michael's to the railway station.

VARIETIES.

MR. JAMES GLEN, who for upwards of 31 years has held the office of town clerk of Gourock, N.B., has tendered his resignation of the position, and his resignation has been accepted.

THE latest of Mr. Percy Lindley's holiday booklets, issued under the auspices of the Great Eastern Railway Company, is entitled "Holidays in Belgium, with Brussels and the Ardennes," and, like all the books in this series, so interestingly written and charmingly illustrated as to make one long to pack up and start at once on the delightful tour described.

ON Monday afternoon the new Brixton Prison was opened for the reception of prisoners, male and female, from courts south of the Thames on remand, and trial prisoners from the South London Sessions and Surrey Quarter Sessions at Kingston. The new goal will greatly relieve the overcrowding which has existed at Wandsworth and Pentonville Houses of Detention for some considerable time past.

THE Archbishop of York visited Scarborough on the 2nd inst. to consecrate the new church of St. Saviour's, which has been built in the north-west ward at a cost of nearly 4,000%. Accommodation is provided for 400 worshippers, and the portion consecrated is a part of a new church designed by Mr. J. T. Micklethwaite, of Westminster, in the Early Decorated style of architecture in three spans, with a bell turret in the centre.

THE twenty applications which have been received for the vacant position of town clerk of York were considered by the finance committee of the Corporation, who selected the following to appear before them at a meeting on Monday next, August 11, when a final choice will be made:—Mr. W. J. Board, deputy town clerk, Cardiff; Alderman R. Percy Dale, solicitor, York; Mr. J. H. Field, deputy town clerk, Bolton; Mr. T. C. Hughes, town clerk of Lancaster; Councillor W. A. Pearson, solicitor, York; and Mr. P. Thomas, town clerk of Leigh. The salary offered is 700% per annum.

CABOT'S INSULATING & DEAFENING QUILT.

A PERFECT DEAFENER.

Stops the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does. Send for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay proof, and vermin-proof, and unflammable.

FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of color, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

THE B. & S. FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

A HANDSOME new screen has been presented to Charlton Kings Church, Gloucestershire, by Sir Frederick and Lady Dixon-Hartland. It is of the sixteenth-century style, and consists of nine bays, with six niches at base and side of a central doorway; the niches (which are richly canopied) containing angels, symbolising praise and prayer. In the upper cornice appears the inscription:—"To the glory of God and in thanksgiving for His mercies this screen was given to the church by Sir Frederick Dixon-Hartland, Bart., M.P., and Agnes Chichester, Lady Hartland, his wife, A.D. 1902."

AFTER being closed for some time while undergoing extensive structural alterations and improvements, the parish church of Fyvie, Aberdeenshire, was reopened on the 24th ult. The extensions and embellishments have been effected at a cost of several thousand pounds, borne by Mr. A. J. Forbes-Leith, of Fyvie, and the walls of the eastern end of the new apse are filled with a fine three-light stained-glass memorial window, manufactured by the Tiffany Co., New York, and erected in expression of the love and affection of American friends to the memory of his son, the late Lieutenant Percy Forbes-Leith, who died in Newcastle, Natal, on the last day of 1900, and whose remains are interred in a new vault situated at the western entrance to the church.

THE health committee of the Corporation of Eccles have resolved to invite competitive plans for the laying-out of the insanitary area of Eccles, which comprises over 20,000 square yards in the town, and which is bounded by the main thoroughfare leading from Manchester to Liverpool and from Eccles to Barton. Provision is to be made on the site for the accommodation of, at least, 170 persons who may be displaced by the carrying-out of the Housing of the Working Classes Act. Over 40 houses on the site have been closed for more than twelve months by order of the borough magistrates. The rentals of the houses which are to be erected are not to be less than 6s. per week, nor more than 8s. Sufficient land is to be retained in front of the area for the erection of business premises. Premiums are offered to architects of 50%, 30% and 15% for the plans respectively placed first, second and third in order of merit.

ST. CATHERINE'S new National schools, Dublin, were opened on the 1st inst. by the Countess of Meath. They are situated in Donore Avenue, South Circular Road, and are constructed to accommodate 500 pupils. The site is a central and convenient one. The cost of the new buildings has been

3,300%, and towards this amount the Commissioners of National Education have made a grant of 1,846%. The Dublin Corporation have undertaken to cover the Poddle river at a cost of 1,800%, thus improving the neighbourhood and giving a much better entrance to the schools. The new schools are spacious, lofty, well lighted and will be a valuable addition to the parish. The old schools, situated in Thomas Court, were very unfavourably situated, and in addition to this serious defect they were badly constructed, and the children who attended them naturally suffered a good deal of inconvenience. The new buildings contain separate schools for boys and girls, and infants' Kindergarten. They will be under the National Board and, in addition to the ordinary programme, it is announced that a room is being fitted up for the purpose of cookery and laundry lessons. The buildings were designed by Mr. Fuller, architect.

BURTON WOOD, Lincs, is a parish with only one ecclesiastical building, viz. a condemned church. The church-building scheme is being taken up very warmly. A preliminary meeting was held on Saturday at the vicarage house, the Bishop of Liverpool presiding. Apologies for absence were received from Lord Lilford and the Archdeacon of Warrington. The Bishop, in the course of his remarks, said a new church was both necessary and desirable on the ground of structure, of size and of situation. The present building had been condemned some time ago by the Ecclesiastical Commissioners; in his opinion it was the worst church in the diocese. Its size was insufficient for present needs, and the space it afforded altogether inadequate to the population of the parish. The present site was also unsuitable, being too far removed from the steadily increasing population of Collins Green. A resolution to this effect was unanimously adopted. It was resolved to take immediate steps to secure a suitable, and if possible free site for both church and hall, conveniently placed between the two chief centres of population—Burton Wood and Collins Green. A sum of 8,000% at least will be required.

THE foundation-stones of a new Free Methodist church have been laid at Murton, near Backworth. The new building will take the place of the old historic structure that has played such an important part in the history of Methodism in Northumberland.

## TRADE NOTE.

The Cherry Tree Machine Company, Ltd., engineers and founders (proprietors of the Manchester Laundry Engineering Company), Cherry Tree, near Blackburn, have secured the contract for the supply of laundry machinery to the infectious diseases hospital, Penarth.

## BUILDING AND BUILDERS.

**MEMORIAL-STONES** of a new Primitive Methodist church have been laid at South Shields. The new building will seat 1,000 people, and is expected to cost 3,500*l*.

**THE foundation-stone** of a new workhouse hospital at Whitehaven was laid on the 31st ult. The site of the proposed building is to the north of the workhouse, and the hospital will afford separate departments and accommodation for both sexes.

**THE plans** for the reconstruction of the terracing at Ibrox Park, the scene of the lamentable accident on April 5, which have been prepared by Mr. Leitch, architect, Glasgow, who designed the park originally, show that the Rangers purpose reducing the terracing on the west end of the field, where the accident occurred, to the same height as that of the east end, and also to very considerably strengthen the whole of the terracing.

**THE corner-stone** of a new hospital at Springhead, Meltham, for the treatment of infectious diseases, excepting small-pox, was laid on the 2nd inst. The hospital buildings will cost 744*l*, and consist of seven blocks, affording accommodation for 150 patients. The hospital site occupies nineteen acres, seven acres being covered by the buildings, and is 790 feet above sea-level. The townships included by the hospital committee are Golcar, Holme, Holmfirth, Honley, Linthwaite, Marsden, Meltham, Netherthong, New Mill, Scammonden, South Crosland and Thurstonland, having a total population of 54,111, and an aggregate rateable value of 182,852*l*.

**THE directors** of the Caledonian Railway have under consideration a plan for the construction of a large new passenger station at Port Glasgow. The accommodation at the existing station has given rise to many complaints, and Port Glasgow

Town Council on several occasions have made representations to the company, urging them to provide increased facilities. Extension of the double line of rails from the west of Port Glasgow to Wemyss Bay is also given as a reason for the proposed scheme. Should the plan be fully carried out, a sweeping change will be made in the centre of Port Glasgow, as the proposal is stated to embrace the demolition of the Star hotel and properties at the head of Princes Street. The bridge to Barr's Brae would also have to come down, and would be replaced by two iron bridges, one leading to the station.

A SPECIAL meeting of the Cavan County Council was held on the 2nd inst. for the purpose of taking into consideration the question of establishing a lunatic asylum in the county. At present all the lunatics from Cavan are sent to Monaghan asylum, which is overcrowded, and a loan of 50,000*l*. is required to make the necessary increased accommodation. The total number of inmates in Monaghan amount to 821, and out of that number 437 are from Cavan county, for which the county has to pay 12,600*l*. a year, or two-thirds of the cost of maintenance of the establishment. It was suggested that a deputation from the Council should wait on the Inspectors of Lunacy and lay the matter before them, and also to interview the Lord Lieutenant, with a view of getting their sanction to the building of an asylum. The suggestion was unanimously agreed to.

A RECENT Canadian invention consists of bricklaying by machinery instead of by hand. The machine, according to a consular report, worked by two men and a lad, will lay 400 to 600 bricks per hour. Door and window spaces cause only a slight delay. The machine is suited for all plain work, such as walls, sheds, mills, factories, rows of cottages, piers of bridges, &c. Considerable pressure is put on the bricks, and it is claimed that the work is more firmly done than by hand. The invention will do the work of six or seven skilled bricklayers, and it is believed that a machine adapted to build a factory covering about 60 feet by 40 feet could be put on the market for 100*l*. The apparatus can be readily worked after a fortnight's instruction.

MR. A. A. G. MALET, M.Inst.C.E., an inspector under the Local Government Board, held an inquiry recently at the County Hall, Oxford, with reference to the application by the Oxfordshire County Council for sanction to borrow 60,000*l*. for the enlargement of the county asylum at Littlemore. In reply to the inspector, Mr. Davenport (clerk to the County Council)

## Best Award of the Sanitary Institute, Three Silver Medals For "THE CLOSET" OF THE CENTURY," WITH SYPHONIC DISCHARGE.

Combines the simplicity of the Cottage Basin and Trap with the advantages of a Valve Closet without the Mechanism.

Depth of Water, 6 inches. Seal in Trap, 3 inches. Surface Area, 12 inches by 10 inches.

In White or Decorated Earthenware, Strong Fireclay or Enamelled Iron, at prices to suit every class of building. No possibility of Syphonage by Discharge of Slops, yet complete removal of contents after use. Special Form of Patented Outlet Joint, securing an absolute and permanent air-tight connection to Lead Trap above or below floor level. Special Flush and After-Flush, Quick-Filling and Noiseless Cistern of simple construction.

This Closet has been adopted in Windsor Castle, Buckingham Palace, the residence of the Marquis of Salisbury, the Surveyors' Institute and Institution of Civil Engineers, Westminster, the Hôtel Cecil, Broadmoor and Hanwell Asylums, the various Railway Stations, and public and private Buildings of all kinds.

## JENNINGS' PATENT SYPHONIC DISCHARGE LATRINES For SCHOOLS, FACTORIES, &c.

In cleanliness and freedom from offence—each section being completely independent—far superior to any system of open and continuous latrines, in which the air (circulating over a largely increased area of impurity) is generating the stench it is desired to avoid, too frequently disseminating infection and disease germs.

In Latrines of the ordinary type the flushing power of the Cistern is spent in the Trough. In the improved System a secondary siphonic action is set up in the range itself, securing the entire removal of the contents and scouring in with all the velocity due to the atmospheric pressure upon the water.

## JENNINGS' PATENT HOSPITAL SLOP-SINK & BED-PAN FLUSHER.

Architects are invited to inspect these and OTHER SPECIALTIES in action at the Works, where further Particulars and Information can be obtained. Catalogues on Application to

GEORGE JENNINGS, LIMITED, SANITARY ENGINEERS TO H.M. THE KING,  
LAMBETH PALACE ROAD, LONDON.

BY SPECIAL APPOINTMENT

Telephone,  
No. 680 HOP.

stated that he did not know of any opposition to the application. The asylum was built in 1846, and the county took into union with it the city of Oxford, the county of Berkshire, including Reading, Windsor and Abingdon. All of these local authorities had withdrawn from the union except the city of Oxford, and the county and city remained the sole partners in maintaining the asylum, two-thirds of the expenses being provided by the county and one-third by the city. For some years the visitors had been urged by the Lunacy Commissioners to enlarge the asylum. The accommodation recognised by the Commissioners was 490, and the usual number of patients now was about 555 to 560. Statistics showed a gradual increase in the past, which threatened to be maintained in the future. The local authorities decided upon the enlargement of the buildings on the present site at a cost of 58,000*l.*, exclusive of the land, the value of which was just under 7,000*l.*, and had already been paid for. Permission was asked for the loan to extend over thirty years. The inspector went through the plans and intimated that he would report to the Local Government Board.

MR. S. MONCKTON COPEMAN, M.D., Local Government Board inspector, held an inquiry at Oundle, Northamptonshire, last week into the application of the Rural District Council for sanction to borrow the sum of 2,000*l.* for the erection of an infectious diseases hospital which they propose to build in Wood Lane. It was suggested to erect an iron building as a temporary structure, but to have permanent drainage and water scheme, and the figures shown for the proposed hospital were:—Price of land (3 acres), 300*l.*, while the drainage, pathways, &c., would cost 400*l.*; caretaker's lodge, 800*l.*; water supply, 150*l.*; architect's fees, 200*l.*; contingencies, 250*l.*; total, 2,000*l.* The population of the rural district was 8,093, number of parishes, 34, and Oundle was situated nearly central. The assessable value was 45,399*l.* There were no loans. The area was 58,807 acres, exclusive of Oundle. In April last a letter was received from the Urban Council objecting on the grounds that the proposed site had a quarter-mile zone with a large number of houses, and the half-mile zone had about 600 inhabitants. Mr. Coombs, clerk to the Rural District Council, explained that it was impossible to avoid highways or doing injury to someone, and he did not know of any site to compare with this. It was remarkable that the Urban Council had taken all this time to consider it was not a suitable site, when in the early stages it was the one selected by them. Mr. Gotch explained the plans, which provided for nurses'

sitting-room, six bedrooms and bathroom, porter's room, kitchen and the usual offices. The Inspector: You have provision for storeroom or doctor's room. Mr. Gotch: The linen could be kept in the hospital itself, and temporary provision be made for dispensary. The Rev. Canon Moore explained what had taken place between the two Councils, and said they had hoped the County Council would have put out a scheme. Mr. Sanderson asked if it was usual to have a small-pox and a general hospital on the same site. The Inspector: Yes, in small places, with an undertaking that small-pox could be not treated concurrently. Mr. Sanderson: I know the Urban Council have always been against an isolation hospital. The proceedings then closed, and the inspector proceeded to view the site.

At Durham on the 24th ult. the foundation-stone was laid of a new Wesleyan church which is being erected in a prominent position in Old Elvet, on a site which was purchased at a cost of a little over 2,000*l.*, the cost of the building, which is from the designs of Mr. W. J. Morley, Swan Arcade, Bradford, and will include a school, being about 8,000*l.* or 10,000*l.* in all. The building will be of Perpendicular Gothic architecture, having at the north-east corner a tower and spire 110 feet in height. The tower will have Gothic inlets on each side and finials on the top. The whole structure will be faced with plain face wall stones, with ashlar stone dressings and mouldings to the windows, and mullions with sunken tracery. The front elevation to Old Elvet will be set out by buttresses and octagon shafts and octagon pinnacles. There will be a fine full light window let into the front face 30 feet in depth and 20 feet in width, which will be sufficient to light the whole of the church, there were no side tracery windows. There are, however, four of the latter on each side of the nave, 11 feet in height, with 5-foot openings, so that there will be ample provision for admission of daylight. As the visitor enters, the vestibule will first be reached. From this on either hand a staircase leads away to the gallery running round the church. The length of the church from the front entrance to the back of the chancel will be 78 feet, the width at the entrance will be 58 feet, in the nave 50 feet, and there will be two large transepts of 14 feet. Adjoining the church will be the choir-rooms, minister's vestry, organ-chamber and choir-vestry. Behind there will be an infants' room, a ladies' room and large schoolroom 56 feet long and 30 feet wide, and, at the rear of all, three classrooms 17 feet long and 14 feet wide. The schoolroom will be a fine apartment. Its height will be 33 feet, and the classrooms will be

feet in depth. There will be all necessary conveniences, and the buildings will be fitted with a substantial heating apparatus to warm the whole of the building in which various departments are conveniently grouped together. Accommodation will be provided for over 500 worshippers on ground-floor of the church, and the gallery will seat about more. Mr. N. Newbould, of New Wortley, Leeds, is acting as clerk of the works.

### NOTTS NEW COUNTY LUNATIC ASYLUM.

The finishing touch was on the 29th ult. put to the new lunatic asylum for the county of Notts, which has been erected at Cliffe-on-Trent from the designs of Messrs. E. P. Hooley & Sander.

Of the site, which comprises an area of 134 acres and 6,880 $\frac{1}{2}$ ., about 22 acres is absorbed in the buildings, lawns and recreation grounds for the patients. The kitchen and laundry will cover about 10 acres. The remainder of the farm is laid down with grass, it being the intention of the committee to produce on the farm the milk for the whole of the patients. The main entrance is on the Cropwell Road, which skirts the eastern side, near which are situated two pairs of large villas for the chief engineer, head attendant and other officials. The main entrance block is situated on the north side, and contains the chief offices and visiting rooms, through which access is obtained to the main corridors communicating with both wings of the asylum. The patients' blocks for males are situated on the east side, as also are the nurses' house, electrical generating station, workshops, bakery and mortuary. The females are placed on the west side, where is situated the laundry block and sewing-room. The central portion of the asylum consists of the general administrative buildings, comprising the general stores and kitchen department. Adjoining these buildings is a spacious recreation-ground designed to accommodate 600 patients, and this is provided with dressing-room accommodation as well as a stage completely fitted with every arrangement for theatrical and musical entertainments. The accommodation for male and female attendants is on either side of the administrative block, the dispensary, as well as the necessary quarters for the housekeeper and servants, being on the south side of the recreation-hall, near which a corridor leads to the assistant medical officer's house. The residence for the medical superintendent is west of the main

buildings, and 300 yards still further to the west is placed the isolation hospital. The administrative buildings are designed to accommodate 600 patients, but patients' blocks have been erected at present for only 452 (226 of each sex). The general construction of the building is of brick, and it has been planned on simple but substantial lines. The interiors of the patients' blocks are finished with a view to the comfort and health of the patients, rather than ornamentation. Wood dadoes are provided in all day rooms. The woodwork throughout is of varnished deal, glazed bricks and tiles being provided wherever necessary. The chapel is of brick construction with stone dressings and tiled roof, and is designed in the Early Gothic style. The interior is finished in a simple manner with plastered walls and pitch pine roof, the flooring being laid with maple blocks. Pitch pine benches are provided to accommodate about 400. The pulpit, reading desk and other special fittings are in polished oak. The engineers and architects responsible for the work are Messrs. E. P. Hooley & J. Sander. Mr. J. J. Bird has acted as clerk of works. The following is the list of contractors:—For the foundations, Messrs. T. Fish & Sons, Nottingham; general contractors for superstructure, Messrs. Pattinson & Sons, Ruskington, Sleaford; heating and ventilating, cooking plant and general engineering, Messrs. Ashwell & Nesbit, Ltd, Leicester; electric lighting plant, Mr. T. Scott Anderson, Sheffield; laundry machinery, Messrs. D. & J. Tullis, Ltd., Kilbowie; locks, &c., Messrs. Wing & Webb, Wolverhampton; sanitary goods and fittings, Messrs. Doulton & Co., Ltd, London; furniture, Henry Barker, Ltd, Nottingham; decorations, &c., Mr. W. J. Sissons, Nottingham.

The total cost of the whole of the buildings and engineering work, site, furnishing, fees and every other item of expenditure in connection with the erection and completion amounts to about 140,000 $\frac{1}{2}$ ., but when the asylum is fully completed for 600 beds it is anticipated the total expenditure will amount to 154,800 $\frac{1}{2}$ ., or be at the rate of 258 $\frac{1}{2}$  per bed.

### THE HOUSING OF THE WORKING CLASSES.

The report of the joint select committee of the House of Lords and the House of Commons on Housing of the Working Classes has just been issued as a Parliamentary paper (171). The committee were appointed to consider the standing orders relating to houses occupied by persons of the labouring class,

and the clauses usually inserted in private and local bills and provisional order confirmation bills in pursuance thereof, and to report whether any amendments should be made in such standing orders and clauses. The following is the text of their report:—

1. We submit two model clauses and three corresponding standing orders, which we recommend in place of the present model clauses and Standing Orders 38 and 111 (H.L.), 38 and 183a (H.C.), dealing with London and all places outside London respectively.

2. We suggest that the model clauses be embodied in a public general Act of Parliament.

3. After hearing evidence and consulting the officials of the Home Office and Local Government Board, we have come to the conclusion that in London it is desirable that every case in which houses of the labouring class are proposed to be taken should be notified to the central authority, while outside London it is sufficient that the attention of the central authority should be called to cases in which thirty persons belonging to the labouring class are displaced in one borough, urban district, or rural parish, as the case may be.

4. In settling schemes for providing new houses in place of those demolished, we think it advisable that the central authority should exercise a full discretion.

5. We recommend that the new houses to be provided be suitable for persons of the labouring class and not too ambitious in character and design; we attach much importance to these conditions.

6. It will be observed that the area within which the new houses may be provided under a scheme is left by us wholly to the discretion of the central authority. It may be, and, we think, will be, found expedient in some cases to erect the new houses at some considerable distance from the houses demolished, and not necessarily within the jurisdiction of the same local authority.

7. We recommend that in London the central authority be empowered to fix all rents for the new houses.

On this point we are not agreed. The above decision was arrived at on a division by six votes to three.

8. In regard to Ireland and Scotland, we were informed that neither the Lord Lieutenant of Ireland nor the Secretary for Scotland desired to make any suggestions to us.

So far as we can judge, our recommendations for places outside London are, with the necessary alterations, suitable for Ireland and Scotland.

The two model clauses and three standing orders referred to by the committee in Section I. have not been printed in the report.

### A PORT OF BIRMINGHAM.

THE Birmingham Chamber of Commerce will shortly receive a communication from the North Staffordshire Chamber as for co-operation to form a waterway from Birmingham to South Staffordshire through the Potteries to Liverpool. The argument in favour of such an expensive scheme is that railway rates are excessively heavy, and if such a canal in existence it would be a great boon to traders. The rate for hardware, for instance, from Birmingham to Liverpool is 20s. 2d. per ton, and for bedsteads 18s. 11d. The railway have killed the exportation of iron from South Staffordshire. Formerly thousands of tons used to be sent abroad, but now it is the other way about; merchants order their heavy iron such as girders, from Belgium. The reason is that the railways encourage the foreigner. The rates from Hull to Birmingham are much cheaper than for the journey the other way, from Birmingham to Hull. This is the sort of thing which makes the Midland trader restive, and again and again has turned his attention to a ship canal scheme. It remains to be seen whether the present effort will be more successful than the one advocated a few months ago, when it was suggested to reach the sea by way of the river Severn and the English Channel.

### A STRAND BRIDGE.

THE question of constructing a bridge across the Strand from the bottom of Wellington Street has been referred on the motion of Sir John Wolfe Barry, K.C.B., who is an alderman of Westminster City Council, to the works committee.

Seen on the subject by a *Daily News* representative, John explained his scheme in detail. By way of removing congestion he would carry the north and south traffic by gradients across the Strand by means of a bridge over the present roadway. The gradient would begin on the south side near Waterloo Bridge, and on the north a short distance from Wellington Street. In no case would the incline be at a sharper angle than is Ludgate Hill or St. James's Street. The approaches and bridge would form an entirely new road over sites now covered by existing buildings, enabling the

to move freely without interfering with the traffic in the d. The existing roadway in Wellington Street would re-very much as it is now, enabling vehicles or pedestrians to or coming from the Strand to journey with greater by reason of the lessened traffic.

uch a scheme coming from so eminent a civil engineer is in to command a good deal of attention. It remains to be whether the Westminster Council will approach the on County Council to find out whether the scheme can be died in the Strand improvement.

he utility of the new street from Holborn to the Strand, John thinks, will be greatly marred if no means are pro- for dealing with the increased traffic that will be brought is point. The congestion is bad enough already, but once new avenue, which empties itself into the Strand at ington Street, is complete, the obstruction promises to ne serious.

his is an old idea of Sir J. Wolfe Barry's for relieving the c of London at congested points. He laid an elaborate ne before the Society of Arts two or three years ago which sed much interest at the time. He would construct cross- bridges or underground subways at Ludgate Circus, adilly Circus, Hyde Park Corner and at Oxford Street by enham Court Road. With the exceptions of Holborn uct, of the north approach of London Bridge crossing nes Street, of the famous Highgate Archway, which carries usey Road over the Archway Road, and of the arches ing the south approaches of Waterloo, Blackfriars and hwark bridges over the roads immediately adjoining the ank, there are no means of crossing the streets of on otherwise than on the level.

Of course all such works would be costly, Sir John readily its. They would involve not merely the actual crossing of ing thoroughfares by means of bridges and viaducts having ned approaches, but the connection of the streets on the must, of course, be also maintained, so that traffic could ge its direction easily. Sir John claims, however, that the its would be well worth the expenditure. In view of what een spent voluntarily by railway companies in getting rid vel crossings and junctions on their main lines of traffic, he not think the outlay necessary for providing over or under sings for the enormous vehicular and pedestrian traffic of on ought to stand in the way of such improvements. n crossings, he claims, would be as efficacious in their way systematically meeting the wants of London as the other

more obvious work of widened thoroughfares, while they possess the advantage that they could be put in hand at once without waiting for the completion of new thoroughfares.

"There is no reason whatever," said Sir John, "why such works should be unsightly. On the contrary, they might be made highly artistic, and become architectural embellishments of London. The mode of carrying them out would require careful study, as different crossings would have to be dealt with in different ways. I have given some consideration to the subject, and I can say there is nothing impracticable in this suggestion of mine for dealing with the growing problem of London traffic. It is a mistake to think the tube railways will solve it. At one time it was thought the Underground would solve it. Everybody knows that the congestion of traffic in the streets of London becomes worse every year, and I venture to think my schemes will help to relieve the congestion on practical lines."

#### BRASS ASHES AS ROAD MATERIAL.

In the sixth report of the committee of public accounts the Comptroller and Auditor-General, in his report on the accounts of the ordnance factories, makes the following observations:—"In the examination of the remains of the royal laboratory stores it was noticed that the ashes of the brass foundry and rolling mills were valued at 5*l.* 17*s.* 6*d.* and 6*l.* 2*s.* 6*d.* a ton respectively on March 31, 1901, although the price obtained for them on sale during the year was 3*s.* 4*d.* a ton only. In reply to an inquiry as to this apparent discrepancy in rates, information has been furnished which shows that the basis adopted for valuation is correct, inasmuch as a new contract was entered into at the close of the year at the higher rates. As the circumstances connected with the credits from the sale of these ashes are exceptional, it may be desirable to mention them. It was decided in May 1889, when the Building Works Department became a part of the ordnance factories, to issue the ashes from the royal laboratory brass foundry and rolling mills free of charge to the superintendent of the Building Works Department for making roads, making up ground, &c., in the Arsenal generally, and this practice continued until June 1900, when an offer was made by a firm of contractors to take and remove all the ashes from the brass furnace fireholes at the rate of 3*s.* 4*d.* a ton. This offer was accepted for a period of six months. Towards the end of the year 1900 it was reported to the Chief Superintendent of the Ordnance Factories by the

police that some scraps and splashes of metals were being picked up and sold to marine-store dealers in the neighbourhood by some building contractors' men in the marshes. A sample of the ashes which were being removed was made up, and when put up to sale realised 6*l.* a ton. Tender forms were then issued to various contractors for a contract for the half-year to September 1901, and finally the tender of the firm who had been paying 3*s.* 4*d.* was accepted at 5*l.* 17*s.* 6*d.* and 6*l.* 2*s.* 6*d.* a ton for ashes estimated to weigh 780 tons from brass metal foundries and rolling mills Nos. 1 and 2 respectively, involving a prospective receipt for the half-year of 4,700*l.* In September 1901 even higher tenders were obtained for these ashes, a contract being made at that date at 6*l.* 7*s.* 6*d.* and 7*l.* 7*s.* 6*d.* a ton for brass foundry rolling mill No. 1 and rolling mill No. 2 respectively. Foundry ashes are also obtained from manufacturing operations in the royal carriage department and the royal gun factory at Woolwich, but in smaller quantities. The former were disposed of at the auction sale of the principal ordnance officer in 1900 and realised about 3*l.* a ton, while the latter were treated in the gun-factory foundry, and any metal found in the sifting was used up at the time."

The committee have made investigation into the condition of things thus brought to light, and have examined Colonel E. Bainbridge, C.B., the chief superintendent of the ordnance factories, on the subject. His statement is that for many years the ashes from the brass foundries of the several factories have been used for the purpose of making and repairing the roads of the Royal Arsenal, the superintendent of building works paying out of public funds the sum of 1*s.* a ton for the ashes and dross from the gun factory, but receiving them free of charge from the other factories which produce them. Only a small quantity comes from the gun factory, the bulk being yielded by the royal laboratory and the gun-carriage factory. The question of the disposal of these ashes was discussed by the military authorities in 1877, when, as the result of the discussion, each department at Woolwich began to claim 1*s.* a ton for the ashes. In 1889 the question was again raised, and it was then decided to issue the ashes free of charge for the purpose of making roads, the Superintendent of the Royal Carriage Department reporting that "he could not say whether the stuff could be disposed of . . . for any money value. He knew of no one likely to want it, and it would only be of use for filling up hollows." The ashes were accordingly so disposed of until the year 1900. In that year

largely increased quantities of these waste products had to be dealt with; therefore, in order to avoid inconvenience at the Arsenal, a contract was entered into with Messrs. McKee & Brothers under which that firm were to take all the ashes and to pay 3*s.* 4*d.* a ton for them. This offer, "which . . . turned material hitherto treated as waste into a marketable commodity was readily accepted, and a six months' contract was made. The contractors took the ashes to their own foundry.

Colonel Bainbridge's statement is as follows:—"Towards the end of October 1900 the police found that some scraps and splashes of metal were being purchased by marine-store dealers in the neighbourhood from some building contractors engaged at work in the marshes—that is to say, the old roads which had been made outside our Arsenal, by the proof being going out to the magazines. It was ascertained that this material had been picked up from slag and ashes deposited long ago in the marshes, and recently turned over and so exposed to weathering influences. The attention of the police was specially directed to the ashes, and Police-Sergeant Greenham discovering similar scraps and splashes in the ashes which were being loaded up under his immediate observation promptly reported the fact and expressed the opinion that what was going out was worth more than we were receiving for it. I then personally investigated the ash-heaps, and found them even after being picked over, still rich in metal. I immediately had a representative sample of this, weighing two tons, put up for sale, when it realised 6*l.* per ton. I then carried out experiments to ascertain whether it would pay to pick out all the metal or to melt it out. The first was found impracticable, owing to some of the splashes being very minute. I then tried picking out the large pieces and melting up the rest. I found this would not pay as well as selling it at the price then offered me, so contracts were made of from 5*l.* to 7*l.* a ton for the residue after picking out the large pieces." The ashes from the factories now produce are worth nearly 10,000*l.* a year after the large pieces have been picked out.

In examination by the committee, Colonel Bainbridge also expressed the opinion that the principal foremen of the factories were the persons to be blamed for the heavy waste of valuable material that has been going on for many years, but he afterwards stated that the superintendents of the separate factories were responsible, though they must, he thought, depend on their foremen "to report these things." He considered that the superintendents ought to have found out the waste if they "had been properly supplied with information," though he

really see how the superintendent can go and grope at his factory and inspect his ash-heaps. It is surely the business of someone to tell him about it." The committee feel able to receive these explanations as satisfactory. An enormous waste of a valuable metal, such as brass, has been going on for many years, the total loss in connection with which is possibly 250,000*l.*, and yet the witness considers that responsible heads of the various factories can hardly be held accountable unless a subordinate, receiving weekly wages, is given attention to what is taking place. A residual of manufacture, which after full consideration had long been valued at 1*s.* 6*d.* a ton, and had recently been disposed of at 3*s.* 4*d.* a ton, is now sold to persons who bought 626 tons of it at the latter price for 6*s.* a ton, and even now there is no guarantee that the price given is adequate, because no analysis of the ashes has been made, and the witness does not deem it necessary to put the matter to such a test. If it had not been for the intelligent action of the police the probability is that the gross waste now being lost would still be going on unchecked.

The committee, whilst accepting the statement of Colonel Abbridge, that owing to the multitude of duties which the Chief Superintendent of the Ordnance Factories has to discharge, it is impossible for him to concern himself closely with details of business in the separate departments, cannot but think that the prevention of waste in those departments is not his direct, primary and obvious duty of the superintendent in immediate control, whether he has his attention called to the matter or not. It is evident to the committee that the reason for this heavy and constant waste has been permitted to occur is the want of the particular kind of knowledge and training required for the discharge of the duties of the posts to which they were appointed on the part of those who have been selected to occupy the chief positions of authority in the several manufacturing establishments which comprise the Royal Ordnance. The committee are strongly of opinion that the daily superintendence and management of these manufactories ought to be entrusted to persons without experience of the methods pursued by the outside trade in relation to the various processes carried on, with a view of securing the most economical and satisfactory general results. The business of works management is a profession in itself; and, as an almost invariable rule, those only are really qualified for it who have been trained in manufactories where the best methods and appliances for saving waste in every direction, and where the incentive of having to meet competition and to work to a profit are daily in

operation. It is to be remembered that all waste that takes place at the factories obviously results in increasing the cost of the articles produced; and, as that cost has much to do with determining the prices paid to private makers for similar articles, the importance of preventing extravagance and waste in production becomes the more manifest. The committee have thought it right to call special attention to the circumstances of this case as it appears to disclose a state of things to which an early and effectual remedy should be applied.

### SCIENCE AND INDUSTRY.

THE report of the special sub-committee of the London Technical Education Board on the application of science to industry has been issued.

Dealing first with the question of the loss of business, the committee state that they were unable to resist the conclusion that various branches of industry had during the past twenty or thirty years been lost to this country owing to the competition of foreign countries, and that in many others our manufacturers had fallen seriously behind our foreign rivals; that London in particular had distinctly suffered; and that these losses were to be attributed in no small degree to the superior scientific education provided in foreign countries. They referred to the transfer from England to Germany of numerous departments of manufacturing chemistry. The best known instance of loss was that of the manufacture of aniline dyes and many other valuable products from coal tar. The total exports from Germany of coal tar products now exceeded 4,000,000*l.* annually, of which about one-fourth came to the United Kingdom. The United Kingdom now paid annually over 3,000,000*l.* for imported chemical dye stuffs of one kind or another. As an instance of an industry in danger at the present time, the committee point to what has always been in part a London manufacture, that of pottery, especially of the finer kinds.

Dealing next with the causes of this loss of trade, the committee observe that all witnesses agreed in considering the relative backwardness of this country in scientific industries as due in the main to the deficiencies of our educational system. The glass industry had suffered from the inability of manufacturers to appreciate the value of science, from want of touch with scientific institutions, and especially from the want of an institution similar to the Physical Institute at Charlottenburg. The recently-established National Physical Laboratory would,

it was hoped, now fulfil this want. That industries were affected by education was perhaps best proved by the vitality of scientific industries in those countries in which the system of secondary education was supplemented by scientific education of university rank, for the perfecting of which no expense was spared. Summing up all the evidence, the committee are convinced that the main causes of our relative failure in the chemical, optical and electrical industries are:—(a) The lack of scientific training of the manufacturers themselves and their consequent inability to recognise the importance of scientific assistance. (b) The defective condition of our secondary education, and the consequent lack of sufficiently prepared recruits for advanced technological training. (c) The lack of a sufficient supply of young men who have been trained in scientific principles and methods, and in the application of science to particular industrial processes. (d) The lack of any institution providing advanced technological training which is sufficiently endowed to enable it to give adequate attention to post-graduate or advanced work.

With regard to science training in the secondary school, the committee state that scientific industries have suffered in England not only through defects in higher scientific training, but to an even greater extent through defects in general and secondary education. They add:—"In the majority of secondary schools the curriculum has been so hampered by the exigencies of examining authorities and of examinations that the teacher has been compelled to devote undue attention to storing the minds of the students with facts for reproduction at the expense of the time which should be devoted to stimulating their reflective powers and making them think. In after life those who enter upon industrial pursuits too often regard science with distrust, and to some extent this distrust is merited, owing to the insufficient preparation and training of those who offer themselves for responsible posts in scientific industries."

Proceeding to deal with the question of science instruction at the university, the committee state that they have been impressed with the need for providing increased opportunities for the young chemist, electrician and engineer. Part of this provision was being made in the evening work of the polytechnics, from which a number of students annually took the degree of B.Sc. at the University of London; but there was a consensus of opinion that the highest grade of technical education must be carried on in an institution of university rank open during the day. The existing institutions of university rank in London were hampered by deficient endow-

ment, deficient accommodation, deficient teaching power, deficient equipment, and by the deficient preparatory training of the students. The improvement of equipment and strengthening of the teaching staffs could be effected partly by co-ordination and partly by securing to the institutions a moderate increase in their income from a reliable source.

Dealing with the development of advanced technology London, the committee express the opinion that the great need of London at the present time is the co-ordination of provision for the highest grades of education and the development of new departments, so that professors of the highest distinction and practical training should have under their supervision post-graduate or other advanced students carry out research work. The committee urge that the education of a leader of a scientific industry should include (1) a general education on the classical or modern side of secondary school up to the age of 17 or 18; (2) three years' training for the B.Sc. degree, followed by (3) two years' "post-graduate" work in order to obtain the D.Sc.

Concluding their report with a review of the work of the prospects of the Technical Education Board, the committee state that the expenditure required to put London in a position to equip itself as well as, say, Berlin, is altogether beyond the range of the sums with which the County Council entrusted the Technical Education Board, and even beyond the amount which it could legally spend on technical education. They were specially impressed by the need of higher salaries being provided for science teachers alike in secondary schools and university colleges, by the desirability of lowering the fees at the university colleges, and by the importance of extending the scholarship ladder in respect of exceptional students to a later age than was at present customary. They did not, however, feel able in the present financial position of the Board to press any specific recommendations. The cause of the want of vitality in our scientific industries was not far to seek; it was due to defects in secondary education and the lack of adequate provision for training and research. If secondary education could be more widely extended, if general and scientific education both in secondary schools and schools of university standing could be made more thorough, and if further opportunities could be provided to enable post-graduate and advanced students to obtain adequate training in technological research, there would be no reason to fear for the future prosperity of our scientific industries.

# The Architect.

## THE WEEK.

THE gift of Osborne House in the Isle of Wight is a royal acknowledgment of the loyalty which has been shown to Queen VICTORIA as well as to HIS MAJESTY. It must be acknowledged that the building is better adapted for a convalescent home for officers than as a royal residence. It is only one of the supposititious Italian villas which were in vogue about sixty years ago. It might have been copied from one of the volumes which were prepared for the guidance of builders who erected dwellings for clients without calling in the aid of architects. Any interest which can be attached to the building is derived from its occupants, and not from its commonplace style. The historical associations of Osborne must always give it importance, but a British Sovereign should possess a maritime residence of a different class. There is another building which might also be utilised for benevolent purposes. As time goes on the unworthiness of Buckingham Palace to serve as the principal abode of the monarch becomes more and more evident. When it was first erected it was condemned, and it will not sustain the criticism of the improved knowledge of art which the country has acquired. A stately palace would exercise a beneficent influence, not only on England, but on the distant lands which look to London for examples of architectural skill which can be imitated.

WE have published the judgment of the Hon. ALFRED LYTTELTON, Recorder of Oxford, in the appeals against the assessment of the City Council of the colleges and university buildings (see *The Architect*, June 27). A "substitute building basis" was adopted by which each of the buildings involved was measured up, and an estimate was made of the cost of erecting another building that would be no less suitable. Mr. RYAN, the City Council's valuer, estimated the cost of the substituted building at an average of a shilling per cubic foot, while Mr. EVE, on behalf of the university, placed the value at ninepence per foot. The Recorder said he found by his own experience that new schools cost at least 1s. 2d. per cubic foot, and he therefore adopted the 1s. per cubic foot as a standard. The decision was generally in favour of the university and college authorities. Counsel for the assessment committee asked for time to consider the decision, as a special case might be applied for. That application was made a few days ago, but was refused by the Recorder. He said he had no power to submit questions of fact to the decision of the High Court. Counsel on both sides had consented to the "substituted buildings basis." It was now suggested that it was a novelty, but it had been accepted by Sir PETER EDLIN, who was a great authority on rating practice. Lord WATSON had said:—"There are principles of valuation which depend on purely legal considerations, and any misapplication of these is open to correction by the Courts. But there are also certain so-called principles of valuation which are simply formulæ for arriving at the solution of questions of fact which have commended themselves to valuers of experience. There may be several alternative formulæ of that kind, all of them capable of leading to a just and reasonable conclusion. It is for the arbitrator who is constituted a judge of the facts to determine for himself which rule of that kind he will accept for his guidance." To state a special case would be to embark the parties in further and fruitless expense. Under the circumstances, we suppose the assessment committee will accept the Recorder's judgment.

WE have already called attention to the difficulties of a surveyor whenever a member of a town or urban council became inimical to him. That was apropos of conduct at Winchester, by which a surveyor was compelled to resign his office. In another case, which has been tried at Birmingham Assizes, the surveyor, instead of resigning, was dismissed. He brought an action for slander against the Mayor of Tamworth. The plaintiff, Mr. CLARSON, was surveyor to the Rural District Council since 1879. In 1881 he was appointed as engineer to the waterworks, and in

1890 he became borough surveyor for Tamworth. Friction arose between the parties, and the defendant described the plaintiff as a curse to the town, an infamous one-man ruler, and on several occasions declared his resolve to ruin the surveyor. With so much provocation it was not to be expected that the words of the plaintiff should be of the meekest. Mr. Justice CHANNELL, who heard the case, said it was very unwise for officials to intervene in influencing the election of those who would be their masters, but seeing that the election cry last November at Tamworth was "CLARSON or no CLARSON," it was only human that the plaintiff should take an interest in the election. Tamworth was at one time rather notorious for the manner in which elections were conducted, and possibly bribery and corruption are in the air. An officer who was for so many years connected with Tamworth could hardly fail to be influential on those occasions, and it was probably believed excellent tactics for the defendant to utilise him. But when he declined, that was no reason for the threat being held out that he would sooner or later be ruined. The surveyor stated that his life during the past two years had been a perfect misery to him. The life of a public official was not a bed of roses; his had been like that of a galley-slave. It was given in evidence that the plaintiff had been most attentive and obliging whilst surveyor. The jury found a verdict for the plaintiff, and assessed the damages at 100l. The whole of the evidence suggested the ease with which prejudices can be excited against a surveyor and in course of time men will come to the conclusion that he must be unfaithful to the trust reposed in him. Damages have been obtained, it is true, but the friends of the defendant will no doubt subscribe the amount he is expected to pay. On the other hand, the surveyor has lost his appointment, for which the amount he is to receive will be an inadequate compensation.

THE programme of the City of Liverpool School of Architecture and Applied Art for the new session has appeared. The studio will open on October 2. Students who intend to join the classes should write to Professor SIMPSON and make an appointment before term begins, so as to be able to commence work without loss of time. They can either follow the three years' course leading to the degree of B.A., with honours in architecture, or the two years' course, at the end of which the college certificate is granted to successful students. The latter course has been in existence during eight years. The degree scheme was started last session. For the first time in England a student can obtain a degree in which a knowledge of architecture is combined with a knowledge of general subjects. Besides the architectural studio, there are also studios for sculpture and modelling, drawing and painting, and design. Evening classes are held for architectural designing, and there is a crafts school in which modelling, drawing, decorative design, wood-carving, wrought-ironwork, brass and copperwork, stained glass, enamelling, furniture and fittings, construction, are taught. In all of the classes the fees are almost nominal. The organisation is effective, and should have a beneficial effect on local architecture.

BUILDERS will be gratified by the decision which was given in the Court of Appeal on Tuesday last. An enlargement of Harrod's Stores is in progress, and, as is usual in all works of importance where expedition is essential, a steam crane is employed. Some of the residents in the neighbourhood applied for an injunction to restrain the crane from operating as early as 6.30 A.M. Mr. Justice BUCKLEY granted an injunction which would prevent the use of the crane before 7 A.M. The defendants appealed on the ground that they would suffer a serious penalty, as they would be paying a large number of men for half an hour in which no work could be executed. Lord Justice VAUGHAN WILLIAMS stated that the Court could not say that it was unreasonable to begin using a crane at 6.30 A.M. There was no vested right which secured people living in a residential street from being disturbed before 8 A.M. It was to the interest of everyone to have the work executed as quickly as possible. He thought that the injunction ought to be discharged. Lord Justice MATHEW agreed, and was of opinion there was no ground for the application or for the injunction.

PAINTERS' ARCHITECTURE: RAPHAEL.

### THE AMERICAN INSTITUTE OF ARCHITECTS.

THE official reports of the annual conventions of the American Institute of Architects enable us to obtain a glance at the state of art in the United States. When we compare the extent of surface which is represented on those occasions with our own little island, it seems wonderful that in America, with its "magnificent distances" between architects, there should be so much unanimity and loyalty to professional ideas. There are chapters in New York, Philadelphia, Illinois, Boston, Cincinnati, Baltimore, Rhode Island, San Francisco, Indianapolis, Washington, Michigan, St. Louis, Cleveland, Kansas, Buffalo, Pittsburg, Wisconsin, Colorado, Worcester, Minnesota, Brooklyn, Southern California, Dayton and New Jersey. Representatives from the majority of them attend at the conventions. But the immensity of the geography appears to have an influence on the practice of the members. An architect's office in an American city is, as the president, Mr. R. S. PEABODY, stated, like a plan factory. It is no longer possible for an architect to make every drawing for a building and to impart to it throughout his own touch and feeling. "Buildings of importance," continued Mr. PEABODY, "will not await one man's time. Modern building, and especially American building, implies a rapid campaign. Where it used to take ten years to spend a million dollars it now takes as many months, or the financier stands aghast as interest runs to waste. These modern building methods and the passion for costly structures are the exigencies from which have arisen the need of large office forces. As in business, trade has massed itself into great consolidation and combinations, so commercialism has brought new problems to our art. It is a surprising fact that in democratic America, of all places, a country where individual exertion and independent action is the mainspring of public life, the spirit of co-operation and combination has so largely supplanted in our art the productions of the individual." Owing to the circumstances of the case success depends in a great measure on the ability of the assistants, and it is believed that the new American office corresponds to a large extent with the French atelier, with its "Anciens." But there is no leisure for teaching the history of art or the theory of design, and on that account education in colleges has become an important question in America.

Mr. PEABODY declares that what can be considered as satisfactory in the position of architects is to some extent due to the American Institute. Many a man, said the President, "who cares little for it benefits because others have cared. Many a man, outside of our numbers, is more respected in his community and has a more certain livelihood because the Institute has proved itself a reasonable public body. Certainly through its influence the perils and hardships of competitions have been greatly mitigated. But all these are small and selfish ends. The real value of the Institute lies in its opportunities, in its openings for useful work and mutual high endeavour. Thanks to the

wisdom of its founders I think it has been a potent means of good. Thanks to them it has none of the features of a selfish trade union."

It is impossible for any one to enter the Institute except he passes an examination or possesses a degree from an accredited school of architecture. The subjects are construction, freehand drawing, history of architecture, elements of form, preliminary design. It is evident, however, from the reports that either the members must have an extraordinary number of commissions or that the majority of architects stand aloof from the Institute. There are only 395 fellows and 215 associates, which is a small total for so vast a territory.

The most important success of the Institute of late was in the appointment of a committee to report on the arrangement of the future buildings in Washington. The United States Government have had the papers read at the last convention printed, and it is expected they will be beneficial in persuading members of Congress to make provision for preserving the amenity of the national Capital. Although the success is only comparative, it is advised that the Institute should take a more prominent part in respect of the disposition of other cities, and should co-operate with societies that have been founded for their improvement. Apparently the recognition of the efforts of the Institute in Washington has emboldened the board of directors to undertake further means for controlling Government. At present official buildings come under the jurisdiction of several official departments. The War Department, the Navy Department, the District Commissioners, the Smithsonian Institute, the Attorney-General, besides various officers, exercise power over architecture in the district of Columbia. It is the opinion of the Institute that Government buildings ought to be administered by a supervising architect, or a bureau of architecture, and it is recommended that active steps should be taken to secure a law to that effect.

In spite of the fact that the Institute has ambitious projects such as would not be tolerated in a European country, there is no neglect of other matters which, probably, are of more account in the eyes of members. It is often complained in England that architects do not call on specialists to give advice as often as is desirable; but would clients willingly pay for the examinations and reports? The American Institute has decided that the following clause is to be added to the schedule of charges:—"Where heating, ventilating, mechanical, sanitary and electrical engineering problems in a building are of such a complicated nature as to require the assistance of an engineer, the owner is to pay for such assistance as the architect may require. Chemical and mechanical tests when required are also to be paid for by the owner." It has yet to be seen whether people who undertake building will agree to the change, and there is no doubt a more exact definition of an architect's duties will be demanded.

It will suggest the extent of building in America when

it is found that no less than 510,000 copies of the "uniform contract" recommended for general use by the Institute have been sold. It has been tested in the Courts, and no case is known of a judge regarding the conditions as illegal or ineffective. There is another subject about which there is less assurance of legality, that is, the extent to which combinations of steel and concrete can be legally controlled by letters patent. It is generally known that the use of Portland cement-concrete with tension members of steel or iron is on the increase. A committee of the Institute says that

The manner of combining the two is very simple, as simple as the combination of wood and iron in an ordinary roof truss, and there are several commercial shapes in steel or wrought-iron which can be used to give the necessary tensile strength, but unfortunately to nearly every combination that can be used with economy has been granted a patent. We believe that there are at present at least five different forms of floor construction based upon the principle of a composite beam or slab, upon which patents have been issued, notwithstanding that the principle of construction is identically the same in all, the variation being only in the shape of a tensile member. Now the point which we wish to raise is, "Can the exclusive right to the combination of ordinary Portland cement with steel in any of its commercial shapes be given to any one person?" or, in other words, "Can the patents that have been issued be enforced?" That this is a matter of great importance to architects must be evident to all, for if these patents can be maintained then it is impossible to secure open competition on any one of them, and the architect can only use them by paying the patentee his price. This will in a great measure prevent the use of what in many instances would be a very desirable form of construction.

It is therefore advised that the subject should be investigated and able legal opinion obtained as to what extent the patent laws apply to the use of steel and concrete in construction.

It was proposed to accept the following clauses for general adoption:—(1) The American Institute of Architects is of the opinion that a better result is always obtained by the direct appointment of an architect for any given work than by the selection of an architect by the process of competition. (2) The attempt to secure work by offering to prepare sketches or preliminary drawings, or to render full professional services at a less rate of compensation than another architect, is unprofessional conduct. But a difficulty arose about the document to which they should be attached. After a long discussion they were passed over; however, both are suggestive of the state of feeling among one class of American architects. It was also decided to utilise the exhibition which is to be held next year in St. Louis for a World's Congress of Architects. The State of Louisiana is not an unfitting place for foreign peoples to meet in, for it was possessed by the French, then made over to Spain, afterwards once more became French territory, and through fear that it might be taken by England, was sold to the United States for 15,000,000 dols.

It is impossible not to be struck by the economy with which the American Institute of Architects is conducted. All the expenses of printing, conventions, rent, salaries during the past year amounted to no more than 5,307 dols., or about 1,000/. It would be no easy task to discover another Society which performs equally efficient work and at as so much to show in the way of publications for as moderate an expenditure.

## THE HERIOT-WATT COLLEGE, EDINBURGH.

TECHNICAL education is a subject which has received extraordinary attention during late years. From the inquiries which have been made it might be easily imagined that a new class of beings to serve as teachers and students was about to be created. Great Britain has long possessed capable men in all branches of applied science, but what now appears to be required are some who will exceed them in power. It might also be supposed that the young folks who will be subjected to the new educational processes, whenever they are devised, will have unlimited time at their disposal to attend lectures and to work in laboratories. From the deliberations in which able people have taken part, we can conclude that teachers will henceforth have to deal with students of an ideal kind, and that the usual

difficulties which arise through natural defects are in some way to be rendered of no account. In the belief that a uniform course of education is practicable, it has been assumed that the teaching of universities can be combined in some mysterious manner with the training that is demanded for ordinary trades, so as to turn out alumni who will be at once specialists and omniscient.

The evidence which was given before the Royal Commission on University Education in Ireland affords remarkable examples of the lengths to which hopeful people can go when they attempt to solve a most perplexing social problem. In the scale of industrialism that country stands the lowest among all in Western Europe. What is desirable for the inhabitants is a course of training that would not handicap them in the competition with other people. For the majority of Irishmen the possession of the usual university education would resemble the professorship of ancient history in the Royal Academy to which GOLDSMITH was nominated, and which, with his characteristic good humour, he described as the giving of ruffles to a man who needed a shirt. What was required for Ireland was a commission with members who had distinguished themselves by the successful application of industrial knowledge, and who would be acquainted with the obstacles as well as the aids to its attainment. The University Commission, however, consisted of a couple of judges, an ex-Home Secretary, a bishop, two professors of Greek, an archæologist, a writer on a theological review and a medical doctor; there was also a scientific professor, but he retreated. Statesmen are allowed to exercise humour occasionally, but a more huge joke was never perpetrated by any Government than the appointment of gentlemen of that class to discover the causes of the backward condition of Irish agriculture and Irish manufactures, and to invent something which would bring about a revolution in them. The Commission would no doubt be effectual if education was intended to form men in which all qualities would be in due proportion, but for industrialism some quality must be dominant.

There was a subtle warning about what was to follow from the attempt of a body so constituted "to inquire into the present condition of the higher, general and technical education available in Ireland outside Trinity College, Dublin, and to report as to what reforms, if any, are desirable in order to render that education adequate to the needs of the Irish people," in what was said in respect of similar conditions of affairs in Greece by Professor MAHAFFY, who is one of the very few representatives of the Irish universities who have gained a reputation elsewhere. He said:—

I should like to call your attention to the mischief done by the University of Athens, which some twenty-five or thirty years ago, when I first went to Greece, established free education, and gave degrees without any fees at all to all clever people who liked to attend it. The result was that all sorts of adventurous poor came to the university from all parts of the Greek world, and lived as porters and as water-carriers and as sweepers of streets; they could afford only one text-book between three or four of them and one candle, and they used to read by turns during the night; one would read for two hours and then go to sleep, and then another would read for two hours. It was apparently a most delightful and pathetic thing to see the anxiety on the part of these persons for learning. But what was the result? The ordinary business of life was neglected, the fields even of Attica lay untilled, and those persons who had congregated together in Athens, and obtained education in the university, devoted themselves to politics, became political agitators, wrote articles in the newspapers and magazines, and ultimately became a most dangerous and turbulent element in Greek society. Your lordship may have seen recently the account of the riots led by university students in Athens, apropos of the publication of a version of the New Testament in modern Greek; and the remarkable feature of the thing is that they are not boys but middle-aged men who have neglected and given up their proper pursuits in life, gone to the university, and not being able to live honestly after getting their degrees, have become dangerous malcontents. I think the similarities between the modern Greek character and the Irish are so strong—I have noted two or three of them in my books—that I think you might fairly be afraid of some similar results in Ireland.

Similar results may also be apprehended in other countries besides Ireland unless a clear view is taken of

actualities. It is desirable that every human being should go through the most perfect course of education that is possible. The Greeks had noble examples among their heroic ancestors of the pursuit of knowledge under difficulties. CALLIMACHUS, the philosopher, and the poet of the renowned hymn to ZEUS, toiled as a water-carrier to earn money to pay fees, and had only a joint interest in a robe and a bed. But the days are gone when great men can live on a handful of olives and water as in ancient Greece, although the distinguished inquirers who formed the Royal Commission may be sceptical about the change.

If considered in the strong light of common sense, the statement which was made by Mr. F. GRANT OGILVIE, at present director of the Edinburgh Museum of Science and Art, about the Heriot-Watt College in Edinburgh, of which he was the principal, deserves most attention. It related to an experiment that is adapted to bring sorrow to all academical souls. But although without a precedent in ancient Greece, it has realised the end for which it was organised, and that is more than can be said of all university systems. Readers of the "Fortunes of Nigel" will recall GEORGE HERIOT, the goldsmith, who was King JAMES's financial adviser, and all visitors to Edinburgh who are architects have admired the hospital, school, or "work" which bears his name, and which some believe to have been designed by INIGO JONES. HERIOT died in 1624, and he left the sum of 24,000*l.* to the magistrates of Edinburgh to found an establishment for the education of orphans of freemen of the city. There was appropriateness in applying a part of the funds, which, it is needless to say, have been considerably augmented, towards the promotion of industrial and commercial skill. The college is also the possessor of any property which belonged to the Watt Institution and School of Art. The Heriot Trust in 1885 assumed the responsibility of the Heriot-Watt College. Originally, it is worth noting, the ministers of Edinburgh were all members of the Board; but ecclesiasticism has lost much of its power everywhere, and now there are only two representatives of the clergy. The other members belong to the Town Council or the University, the Royal Society, the Chamber of Commerce, the School Board. The Board did not seek advice by means of a costly Royal Commission, neither did they go to Greece or the Mediæval universities for models to imitate. They simply accepted things as they were before their eyes, and, realising the dearth of technical knowledge, and the difficulty of finding time or money to obtain instruction, they endeavoured to bring knowledge within the reach of the poorest and the busiest.

Under the circumstances, it was plain that the majority of students could only attend in the evening. Therefore, says Mr. OGILVIE, "the funds available for the College are specifically directed, first, to the developing of evening classes, and the work done in the College in the day classes has been conditioned by the fact that the endowment might not be used directly for their support, although the day classes are authorised to utilise all the provision in the way of buildings, apparatus, appliances and general expenses which are provided for the evening classes, that in itself constituting a valuable endowment for the day classes."

The success of the experiment is evident when we learn that no less than 3,800 students attend the classes. It was not assumed, as is the case too often in England, that this instruction is sufficient, for the work done in these classes takes account of the fact that the students are gaining practical experience in the workshops, offices or manufacturing of the district, so that it is distinctly co-ordinated with that training. At the same time the subjects are so advanced that students from the university join the classes which in some instances are more developed. There are day classes as well, where higher studies are followed, but it is possible for students of the evening classes to reach them through winning bursaries. Facilities are offered to students who are desirous of learning, and we are told it is not infrequent for a student to come to the College for one year in the day classes and then go to his apprenticeship, or practise in the workshop for two, three or even four years while he continues his work in the evening classes, and then return to the day classes at the end of that to take up more advanced matters of study.

The co-operative spirit is also strong in Scotland, and there is little of that jealousy or rivalry which is familiar in England. The engineering department of the Heriot-Watt College being more complete than that of the Edinburgh University, no attempt was made in the latter to excel the new institution. The classes have therefore been arranged as if both formed one institution. For example, a student in the university who wishes to graduate in electric engineering must work at the Heriot-Watt College. It is realised that by this method theory and practice can be combined; in consequence the diplomas of the Edinburgh University in engineering subjects will have a value that is not always given to English diplomas. There is, no doubt, a prejudice against evening classes, although it is well to remember that so conservative a university as the late Cardinal NEWMAN adopted them when arranging an experimental university in Dublin. What is done at the Heriot-Watt College can be made plain by a few figures. In the university course of natural philosophy 100 lectures are delivered; a similar course in the college consists of 12 lectures, 40 tutorial hours, and 120 hours in the laboratory or in all, 300 hours devoted to physics, and, in addition, mechanics occupied 120 hours.

Students who accept so much constant toil cannot fail to attain whatever is possible for well directed labour. But the professors must also have uncommon ardour. The desire is to seek men who are young, and who know the way to higher distinction. An important point is that the professors are also allowed to supplement teaching with practical work, especially in consultation. In that way the professors are always in relation with the business of the district. There can be no danger of the instruction becoming bookish theory or prattle without practice. In the section of commerce it is most difficult to secure men who are willing to teach. According to Mr. OGILVIE, the best men are induced to take up the work by their interest in it. Such men are generally too well off to care very much about the salary, but the College insists on paying them one, and then they feel bound to recognise that they have got to do the work. The crux of the matter is that good men must be secured or the student won't come. They are secured through their public interest. The man is generally a man of light and leading in his department, whose authority is recognised at once by those engaged in the subject, and is known to the students who attend the classes.

In Scotland at one time the most direct road to the university was through the church. A lad who was steady, industrious and intelligent would be considered by his parents, his schoolmaster, the parish minister as an eligible candidate for the ministry. Under the circumstances he could hardly fail to be of the same opinion. If he successfully passed examinations he was able to enter the university, and if he were capable of suffering privations could pass through all the grades. Sometimes the students realised that they were not fitted for an ecclesiastical career and followed another course of life. By the establishment of the Heriot-Watt College a wider road is complete. Smart boys in primary schools win bursaries to secondary schools, and if they are of a practical or scientific turn can join the Heriot-Watt College, and should they desire may eventually gain a place in the university. There is the closest and most cordial relationship between the two institutions. In Glasgow there is also a connection between the University and the Glasgow and West of Scotland College.

In all these arrangements there is no patronising on the part of the universities. It is felt that all places of education have a common purpose. Men are to be equipped to take part in the struggle for existence, and it is recognised that the mode of training must be suitable to the position in which they will have to be installed. But this harmony has been brought about without acrimonious discussion or agitation. Chief Baron PALLES, who was one of the witnesses before the Commission, and who advocated industrial and technical education in order to enable our countrymen to successfully compete with foreigners, has said that the unsettled state of the question has worked immeasurable injury in Ireland. In England there is no doubt that technical education is hampered by Government

regulations which are not suited to insure the success of students in competition with those in other countries. If the Heriot-Watt College had been from the first subjected to official rules and regulations, the evening classes would not be attended by nearly 4,000 students, and neither would it be tolerated that instruction should be given which was only adapted for those who had acquired more or less experience in offices or workshops. But in Scotland it is realised that business has an educational influence which it is desirable to utilise and to extend. It was characteristic of the English system when we find Mr. SIDNEY WEBB, chairman of the Technical Education Board of the London County Council, saying that "unfortunately in architecture, as in some other professions, we still retain the old status of pupil and master, which, I think, is not so good as more definitely-organised university instruction." A brief conversation with the Board of the Heriot-Watt College would have convinced him that with tact the relation between pupil and master could be made a factor in education and even become an auxiliary to university courses. But who can expect good sense in any department of the London County Council?

### MICHEL ANGELO AND MYTHOLOGY.

HERE were several of the contemporaries of MICHEL ANGELO whose orthodoxy was considered doubtful. One of them who was known in England, and who disfigured MICHEL ANGELO's countenance, was in Spain involved with the Inquisition on account of an act of irreverence towards one of his own figures. It was probably not the only deed of the kind of which the irascible TORRIGIANO was guilty. But MICHEL ANGELO has been ever accepted as a type of a Christian of the severest order. He was an admirer of SAVONAROLA, and, like the Dominican, he was not always obedient to the commands of a Pope. But in his poems we see the mystical turn of his mind, and one of his last sonnets, if not the last, was an appeal to CHRIST which is expressive of religious fervour.

MICHEL ANGELO, however, was the child of his time, and he could not avoid the influence of those survivals of Paganism which for years seemed to be inseparable from all manifestations of the Renaissance. It is difficult for us to realise the dual power which was then exercised over the minds of artists and writers. We can only compare it to the peculiarities of speech which were heard in England after the coming of the Normans. For a time there must have been a dialect which was partly Saxon and partly French. Men found it was practically beyond their power to express their thoughts in the old tongue, and by degrees the words of the invaders became indispensable for everyday wants. In the same manner not only mythological legends but mythological beings were turned to account by men whose lives were devoted to opposition to everything that was supposed to be remotely Pagan. Not so many years have elapsed since the old Roman custom of introducing the heads of oxen on the temples as symbols of sacrifices was abandoned in designing Christian churches. That was a relic of a system which was accepted as inevitable in the fifteenth and sixteenth centuries. The pagan symbols and the gods and goddesses who were adored prior to the introduction of Christianity were employed with the same ease as if they were part of a rhetorical language and were no more evil than Greek and Roman phrases.

The earliest legend about MICHEL ANGELO which has come down to us relates to his modelling a head of an old man. LORENZO DI MEDICI pointed out to him that the features were too perfect, and the young artist easily remedied the defect by a few blows of his mallet. It must be allowed at the memory of the first work which gained him notice never passed away from his mind. In modern times his *Moses*, which many regard as his noblest work, has been declared to be no more than a figure of a venerable man. When the length of the arms, which exceed those of men, was objected to in GOETHE's presence, he satirically replied that the sculptor made them long in order that they might support the tables of the law, and, moreover, MOSES was a commander, and for that purpose

lengthy arms were desirable. What are many of the demons in the great painting of the *Last Judgment* but satyrs of a low type? Satyrs are also introduced on the mausoleum of JULIUS II. in the church of St. Peter in Vinculis. His *Drunken Bacchus* is, in the opinion of some admirers, the most perfect of his works. There are also figures, paintings and drawings of such subjects as GANYMEDE, LEDA, VENUS and CUPID, HERCULES and the lion, the downfall of PHAETON, &c. In those days it was expected that an artist should grapple with those subjects as if they were established tests of skill. MICHEL ANGELO worked in wood and snow as well as in marble and bronze, for in his time a sculptor who confined himself to the use of one material was thought to be incomplete, and in the same way the great Florentine was fascinated, it may be, by the difficulty rather than by the appropriateness of a subject, and he was prepared to display equal fury or enthusiasm in the erection of mythological or scriptural subjects. The belief of the time warranted some of his experiments. It was regarded as appropriate when he placed the sibyls on the same level as the prophets in the Sistine Chapel, and that is not the only suggestion of antiquity to be found in the building.

Can it be said that the *Last Judgment* is in keeping with theology, or even with the interpretations of the subject by earlier Christian artists? In the Judge we have an entirely Pagan type—one that bears more resemblance to a young ZEUS than to the usual conception of the Founder of Christianity. With the exception of the figure of His Mother, who appears to shrink from the exhibition of power, there is not one among the hundreds of figures that is suggestive of a Paradise worth seeking after. The martyrs have not overcome human weakness, and seem as if they were soliciting revenge. CHARON, the ferryman, was by the Greeks sometimes described as bantering his passengers, who trembled on the voyage across the Styx. But they would have avoided exhibiting him as brutally using his oar on the unfortunate victims. This incident is by itself enough to reveal with how little of the Greek spirit MICHEL ANGELO was endowed. It is not merely in power of representing the human form that the Greeks were great; they had other qualities which were unattainable by artists of coarse fibre. The painting is an effort to combine Christianity and mythology, but it does not present the qualities which are characteristic of either, and however deserving of admiration it may be for the skill shown in the representation of action, it wants dignity and is therefore a failure, for it degrades scriptural teaching. In saying this we know we make ourselves liable to be considered as evidence of the artist's prophecy, "O quanto quest' opera mia ne vuole ingoffire." But the admiration of MICHEL ANGELO has become too indiscriminate, for in a painting much else is to be desired besides vigorous thews and sinews, and in our time muscularity alone seems to be appreciated.

In any city of Western Europe the employment of Christian and Pagan elements would appear more incongruous than in Rome. Within St. Peter's it is possible to discover unsuitable subjects in the decoration, and it suggests that the license of the Mediæval sculptors found its way across the Alps, and could not be overcome in the centre of ecclesiastical Rome. Artists, and those who looked on their works, considered the value of the representation more than compensated for any loss of unity. There seemed also a malicious pleasure with some of the patrons to shock the feelings of ascetics. The subjects which LORENZO DI MEDICI selected for representation were *The Twelve Labours of Hercules*, for POLLAJUOLO. GHIRLANDAIO was entrusted with the series relating to the marital misfortunes of VULCAN. LUCA SIGNORELLI, whose *Last Judgment* inspired MICHEL ANGELO, was favoured with a commission for nude Olympians, while BOTTICELLI made several versions of VENUS under his patron's directions. PONTORMO and MICHEL ANGELO co-operated in the production of a *Christ appearing to Magdalen* and a *Venus*, and we suppose the subjects presented themselves to their eyes as equally interesting. It may now seem anomalous that artists should engage in the production of works which were so widely separated by the character of the subjects. But in Florence

and Rome there was a peculiar indifference to the boundaries between sacred and profane art, and painters accepted commissions for one or the other class with a like satisfaction. In Venice those ancient subjects were of little account, or were superseded by anomalies of another kind. The city assumed the place occupied elsewhere by some heathen goddess. The glorification of Venice surpassed that of VENUS.

With the majority of painters a severe standard of judging is not applicable, but it is different with MICHEL ANGELO. He sympathised with SAVONAROLA when the prior endeavoured to prevent the Paganising of Christian art, but the fact remains that MICHEL ANGELO continued throughout his life, or at least until he became blind, to utilise Pagan ideas without the least remorse. His mind was sensitive, but in many ways he showed himself to be no more than a fallible mortal. His conspiracy with SEBASTIAN LUCIANI to diminish the reputation of RAPHAEL was a display of moral degeneration, and his combination of Pagan elements was another. His architectural freaks were signs also of weakness. But there was much in his character and his work which more than compensated for his correspondence with ordinary men.

### ITALIAN ANTIQUITIES.

THE British Consul in Naples, Mr. Neville-Rolfe, in his annual report to the Foreign Office, writes:—

For the last half century Cuma has yielded up treasures from its necropolis. The Count of Syracuse obtained a gallery of vases from it fifty years ago. Mr. Stevens succeeded him at a short interval. Both these collections are now the property of the nation. For the last few years of the work of Mr. Stevens nothing of great interest was found, and it was thought that the necropolis was exhausted, but an Italian landowner has begun again with praiseworthy perseverance; after finding a statue and other objects of the Greek period he came upon a tomb in which was a tortoise-shell disc, a unique object which experts pronounce to have been a mirror. This is not a very probable solution, tortoise-shell at the best being an inferior reflector. It is, of course, not impossible that it was the back of a mirror of which the reflecting surface has disappeared. The reflecting surface of ancient mirrors was silver plated on bronze, and such mirrors are frequently found in the tombs of Greek and Roman ladies with highly ornate backs made sometimes of silver, but usually of bronze and decorated with bas-reliefs or incised drawings. No tortoise-shell has ever been found before, and the question arises where it could have come from. The supply of the present day comes from Zanzibar and the West Indies, and no doubt in the present instance the object must have come from Africa.

In the neighbourhood of Cuma some further interesting tombs have been discovered, and these are thought to be pre-Hellenic. One of them contained objects in silver and bronze, besides being rich in ornaments made of electrum (gold alloyed with silver.) Electrum objects are rare, the great collection of them by Baron Marcello Spinelli having been found on his estate a few miles from Naples and considered till now unique. It has never occurred to anyone to call these objects pre-Hellenic before. A heavy silver casket was found in one tomb, but there are two others which were found by Mr. Stevens some years ago. The one now found is fastened with heavy nails. Some exquisite gold ornaments were found in this tomb.

Pompeii has only yielded one object of great importance, a small statue of Perseus about 20 inches high of very spirited execution. The subject is unique as far as ancient sculpture is concerned. A second bronze organ has also been discovered very similar to the one found some twenty years ago. They are in the form of a syrinx or Pandean pipe, but are so large that they must have been blown with a bellows or with a wind-bag like bag-pipes. There is very little doubt that the modern organ was evolved from the syrinx blown by mechanical means.

The entire reorganisation of the Naples Museum has been a great feature of the past year. A vast number of objects hitherto not exhibited have been brought to light, much more space has been granted, and many of the objects have been named, which is a great help to visitors. It has been an arduous work, and will probably not be finished for more than a year. It is not to be supposed that such a complete transformation could be carried out without evoking a great deal of criticism and opposition, and a special commission was eventually named to control the direction. To those who were acquainted with the museum as arranged before no new arrangement could be quite satisfactory, and the outcry of

"change for the sake of change" was sure to be raised, whether it was deserved or not. The entire museum was renumbered about sixteen years ago, and the new arrangement has thrown these numbers into utter confusion. It would be of great service to students were the collection renumbered separately—that is to say, if a series of numbers were given to the marbles, another to the frescoes, and so on, since by renumbering the museum as a whole we have now reached upwards of 120,000 exhibits, and such long numbers have manifest disadvantages for reference.

An arrangement has been made with the Italian Government in regard to the magnificent frescoes found on private ground at Boscoreale, near Pompeii, whereby some of the pictures will remain the property of the Government, and the remainder will be allowed to be exported. They have accordingly been sent to Paris, where Messrs. Cannessa, antiquity dealers, of 19 Rue Lafayette, will treat for their purchase. The Berlin Museum is said to have offered 40,000*l.* and expenses for them. The expenses amount to a very considerable sum, but the frescoes are of unexampled breadth of treatment and are in value far beyond any yet found.

Some interesting catacombs have been discovered running beneath the Monte di Dio in Naples. The entrance to them was discovered on pulling down some houses in Santa Lucia. They extend a long way into the hill and are probably of Roman period. As they have not been opened to the public no scientific account of them has yet appeared.

### EXCAVATIONS IN PALESTINE.

AN account has been given by Professor Sellin of the results of the excavations which he carried out in Palestine for the Vienna Academy of Sciences. During a previous visit to the Holy Land he had noticed a large mound, or small hill which he considered was probably of artificial origin, and might conceal the remains of some ruined city. On his return he induced the Academy of Sciences to provide him with the necessary funds to excavate the site. It lies near the village of Tanaak, one day's journey from Jaffa and three days from Jerusalem. The permission of the Sultan having been obtained, Professor Sellin started for Palestine again with the necessary equipment, and, after some little difficulty with the people of the locality, began his excavations on March 1, employing as many as 150 workmen.

Under the mound no fewer than four castles or fortresses were discovered. In the middle were the ruins of an Arabia castle, on the east a castle of the period of King Solomon, on the north-west one of a late Israelite period, whilst on the west was found the earliest of them all, one of pre-Israelite or Canaanite date. All the castles had been plundered before they were destroyed, so that no valuables were found, but objects of stone and clay and weapons were discovered, which assist in fixing the approximate date of the various buildings. The Canaanite castle is the oldest, built of unhewn blocks of stone, which show no marks of the chisel. Inside lay fragments of images such as are mentioned in the Bible, and also a number of small ornaments made of stone or earthenware, mostly representing beetles, scarabs and other insects and bearing inscriptions. There were, too, some rude weapons and vessels. The Professor puts the date of this castle at about 2,000 years before Christ, and suggests that it was destroyed by the Israelites, perhaps under Solomon, who proceeded to build their own fortress. Though this second building has also suffered considerably, enough remains to show that it belongs to the so-called Solomon castles. In both, curiously enough, were found idols, vessels and other objects belonging to religious rites, such as a sacrificial pillar of stone with an opening for libations, a stone altar, and—the most important find of all—an earthenware altar in the form of a throne, adorned with cherubim and lions. This is the only existing representation of cherubim of that date. They appear as human heads with a lion's body and wings.

The late Israelite castle appears to have been a fortress only. The Arabian castle shows more architectural skill than the others in its arches, &c., and recalls the style of the period of Haroun-al-Raschid. Vessels and lamps were found, and inscriptions of a religious character. Beneath the ruins of the castles human remains were found buried with vessels bearing inscriptions, while close to the Solomon castle a cemetery for children seems to have existed. Professor Sellin describes the excavation of the Canaanite castle as his chief feat, for though remains of such castles have been previously discovered by Englishmen, none have hitherto been completely laid bare. He is of opinion that he will now be able to draw a complete picture of the civilisation of the Israelites and Canaanites in Palestine. Most of the objects found have been sent to the museum in Constantinople, but efforts will be made to send some of them to Vienna.

## CORONATION RELICS.

A MEETING of the Sussex Archaeological Society was held in Hastings on Tuesday and Wednesday. At the *conversazione* several relics and illustrations relating to former coronations were exhibited. A paper was read by Mr. W. V. Crane, in which he said that the great historical ceremony which took place with so much glory on Saturday last, and at which the Mayor of Hastings represented the town, the premier Cinque Port, with so much honour and distinction, found a faint echo with them that day. The relics which surrounded the company were fragments saved from past coronations, and upon their history he wished to make a few remarks. The relics of the royal canopies were most interesting of all. Those now in Hastings were the only canopy relics which had been exhibited publicly of late years. The White Book of the Ports, which commenced in 1433, described the canopy to be held over Richard II. as follows:—"Un drap d'or, ou de soy, à la volonté du Roy, sur quatre lances batues d'argent." That was to say, a cloth of State made of gold or silk on four lances of beaten silver. The canopy held at the coronation of Queen Margaret of Anjou, the daughter of the King of Sicily, had four bells and staves, and these were given to the western Ports, Hastings, Winchelsea and Rye. After this the canopy, staves and bells became stereotyped in shape, but the descriptions used varied. "Drap" became "canapye," and lances became staves. Then appeared the bells and the tassels, which were used to fasten them to the corners. There were also decorations called "Knopps" (German, Knopp: a button), and also a *bague*, an expression used architecturally in Tudor times for a podlike finial or poppy-head. As to the canopy of later times, the picture they possessed of the canopy of Queen Charlotte, carried at the coronation of George III., resembled a tuft of ostrich feathers.

The canopies were the feudal pay for the services rendered by the Ports, and in pre-Reformation days the eastern Ports gave their shares to the shrine of St. Thomas of Canterbury and the western to Chichester Cathedral. Since the days of the Reformation the shares have become the private property of the canopy bearers, and in a general way the bearers kept the bells themselves, the staves were melted down and the cloth was divided. The oldest relic in the collection was a fragment from the canopy of Queen Anne, which until recently decorated the pulpit at All Saints Church, Hastings, the cloth being of plain scarlet and having a yellow fringe 5 inches long. At the Hastings Museum were relics of the canopy of George III., which had been lent by Sir Anchtel Ashburnham-Clements, Bart., a lineal descendant of William Ashburnham, M.P. for Hastings, and one of the canopy bearers at King George III's coronation. That family had been closely connected with Hastings since the days of Charles I., John Ashburnham being the Member for the town in 1628. The relics included a piece of the cloth of gold, in which silk formed the main warp, on which the gold threads of the woof appeared as an interlacing pattern of roses, buds and leaves. The bells, according to Sandford's "Coronation of James II.," were fastened by an ornamental double-looped bow outside the four corners of the canopy. The bells at the Hastings Museum were presented by Sarah, Countess of Waldegrave (formerly wife of Edward Milward, mayor of Hastings, and canopy-bearer to George IV.), to the South Kensington Museum, and were temporarily placed at the Hastings Museum by the Board of Education. Mr. Crane then proceeded to describe some illustrations of the bells borne on different canopies, and then, speaking of a silver canopy staff which was exhibited, pointed out that the top of the staff fitted into the canopy. It was, he stated, fixed with pins of some kind, which allowed the canopy to sway to and fro, the result being that at his coronation King George IV. preferred the risk of sunstroke to the danger of the canopy falling upon him.

They now came to the question of costume. In ancient sumptuary laws the costume was a matter of law, and the words "citizen's gown" prescribed the shape and material; no fur was allowed to a citizen, but lambswool only. Pictorial evidence showed the shape or gown worn by the barons, and documentary evidence proved the material. At the time of the coronation of James I. the sumptuary laws had been relaxed, and the citizen, though wearing the citizen's gown, indulged in rich materials—silks, satins and furs—at his pleasure. A townsman, or citizen, he remained, however rich in the material of his dress. The dress of the Cinque Ports barons who held the canopy of James I. was seen in an old contemporary print published in Knight's "England." Here the heavy though full gown and the hanging sleeve allowed the arm freedom to carry the canopy. It was described in the Romney records, and noted by Ross in reference to the coronation of James I.:—"It is decreed that every baron shall be apparelled in this sort: 1st, one scarlet gown down to the ankle, citizen's fashion, lined with satin." This gown is the mayor's gown, worn unchanged since those days till to-day. This gown was shown in Speed's "History," 1616, and described simply as the citizen's dress.

The dress was described in the account of George II.'s coronation as follows:—"The barons met October 11, 1727, and their habits were made in this mode:—The coat was made of the finest scarlet cloth, in fashion as a master's, and a pudding sleeve gown, only a longer train, and a large cape; it was faced with rich crimson sarsenet, the waistcoat was crimson sarsenet and faced with white sarsenet, and breeches of the same cloth. The stockings were of the finest scarlet worsted. The shoes were black velvet, and the cap the same." In the pictures of the coronation procession of James II. and the mode of carrying the canopy it was interesting to observe that there were six staves to the canopy, and sixteen bearers in some cases putting one hand to the staff, and all wearing the cap on the sleeve. They now came to the dress worn by Mr. W. P. Lamb when acting as a canopy-bearer to George IV. and representing the town of Rye. This family had long been important citizens of Rye, and the speaker said that he had found their names recently in correspondence dating from the time of George II. Mr. W. P. Lamb at one time had been presented by the people of Rye with a silver cup for raising a troop of light horse during the Napoleonic scare of invasion.

With regard to Mr. Lamb's costume, it was necessary to study the *coup d'œil* of the Abbey on the occasion of the coronation of George IV. One great object aimed at was magnificence and unity. This was gained in this way. One period was adopted, viz. the Tudor period, and the costumiers and artists of the time put all the knowledge current into the completion of the ideal. Mistakes were made, but no worse than the mistakes made by Sir Joshua Reynolds and Sir Thomas Lawrence. Added to this, nothing was spared in the way of expense. A mistake in the dress was the attempt to copy Sandford, the Lancaster Herald of James II., to whom everyone turned for the authenticated dress of each representative at a coronation, whether peer or commoner, prince or Sovereign. An attempt had been made to copy the hanging robe, and as it had not been understood the result had been a nondescript sort of Hussar jacket, which, though effective as a decoration, was not on an historical basis. The doublet and hose were effective, but the hat, he understood, had been lost.

## COLONIAL COPYRIGHT.

A DEPUTATION from the Society for the Protection of British Fine Art Copyright in the Colonies waited on Sir Wilfrid Laurier on the 8th inst. in connection with a decision in the Ontario Court of Appeal that a British copyright owner had no protection in Canada. Mr. Grundy pointed out that it had always been considered that Canada afforded protection to British copyrights duly registered in England, and this view was officially confirmed by the Canadian Minister of Agriculture, under whose department copyright laws came, in a letter of his dated 1889. Canada, by being a party to the Berne Convention, was afforded full protection in the various countries which were parties to that convention, and it was unfair that it should take every advantage and give nothing in return. The present decision had been arrived at owing to the law being drafted in a faulty manner. No vested interests would suffer by the Dominion of Canada's making its law reciprocal, but if piracy were legally permitted art in Canada would be sure to suffer. Others spoke in support of the request. A petition, headed by Sir Edward Poynter and signed by most of the Royal Academicians and many others interested in fine-art copyright, was handed to Sir Wilfrid Laurier. The latter promised to give the question his consideration, and to forward the petition to the responsible Minister in Canada.

## THE NATIONAL PORTRAIT GALLERY.

THE trustees of the National Portrait Gallery have received, under the will of the late Sir Arthur Seymour Sullivan, the portrait of that eminent musician, painted by Sir J. E. Millais, R.A. The trustees have decided to accept the bequest, suspending on this special occasion their usual rule as to the expiration of ten years from the date of decease. The portrait of Sir Arthur Sullivan, which had been deposited temporarily in the National Gallery of British Art, has now been removed to the National Portrait Gallery. The trustees have also accepted as a gift the fine portrait of the Very Rev. Henry Hart Milman, D.D., Dean of St. Paul's, the eminent writer and divine, painted by Mr. G. F. Watts, R.A., and presented by the dean's three sons, the Rev. William Henry Milman, Mr. Arthur Milman and the late Sir Archibald Milman, K.C.B. The trustees have also purchased from the executors of the late Miss Ann Smart a portrait, painted by Bradley, of her father, Sir George Thomas Smart, the musician, who conducted the music at the coronations of William IV. and Queen Victoria.

## NOTES AND COMMENTS.

THE prizes have been awarded by the advisory committee appointed to consider the essays and plans for the KING'S Sanatorium for tuberculosis. Dr. ARTHUR LATHAM obtains the first premium of 500*l.*; with him Mr. WILLIAM WEST is associated as architect. The second prize of 200*l.* was awarded to Dr. F. J. WETHERED, Messrs. LAW & ALLEN being the architects; and the third prize of 100*l.* was won by Dr. E. C. MORLAND, with Mr. G. MORLAND as architect. Essays by Dr. P. S. HICHENS (Mr. R. W. SCHULTZ, architect), Dr. TURBAN (Herr J. GROS, architect), Dr. JANE WALKER (Messrs. SMITH & BREWER, architects), and Dr. J. P. WILLS (Mr. WILLS, architect) were declared to be of great excellence. Although the competition was international, the successful essayists, with the exception of Dr. TURBAN, belong to this country. It is generally believed that a site between Fernhurst and Midhurst has been selected. The district was declared by WILLIAM COBBETT—and there was no better judge—to be probably the most beautiful in the South of England. It is elevated, which is an advantage in a medical sense, but it will be necessary, if the convenience of patients is considered, for new roads to be made which will not be trying to the lungs of sufferers. Another advantage of the site is derived from the pine trees which surround it, and which are generally held to be an aid in convalescence. The English Channel is not more than fifteen miles away. It is not likely that a more eligible site will be discovered than is found on Lords Common, which belongs to the Earl of EGDMONT.

HE was a shrewd witness who, in a case relating to the blistering of plaster which was recently tried in Birmingham, hesitated to give his evidence because, as he said, the action could have been settled out of Court in ten minutes while it occupied the Court for a couple of days. The circumstances revealed the need for more information about the chemistry of lime when used in building. The plaintiff, Mr. NEWELL, was a master plasterer, and he sought damages from the Aston Junction Company, Ltd., for breach of warranty. The plaintiff purchased 60 tons of Buxton lime from the company. It was found that some of the plastering in which the lime was used blistered or bubbled. The parts had to be taken out and replaced, which caused expense, and, moreover, the plaintiff's reputation suffered. When he complained the defendants wrote saying, "It would seem that you had some lime a little better burnt than usual, and did not give it sufficient time to slake in the pit. However we have cautioned our workpeople, and you will have no ground for complaint in the future." The question which had to be decided was whether sufficient time was given for slaking, or was the lime of inferior quality? The witnesses differed about the time required for mixing and for using the putty after it had been run into the beds. According to the plaintiff, the putty should lie in the bed from seven to fourteen days, but, provided the materials were good, it might not do any harm to use it in three or four days. Still, it would be safer not to do so. He denied that he had habitually used it seven or eight days after, or that in connection with a nurses' home he used it after it had been in the beds for only two days. Another witness held that Buxton lime plaster could be safely used three days after the bed was filled. The clerk of works at one of the buildings stated that he complained about the putty being used too soon after the running. Mr. COOPER WHITWELL, the architect, explained that when a small amount of blistering occurred it was usually supposed that some quantity of builders' lime had been accidentally blown or scattered into the putty. It would then begin to slake. Another cause was undue haste in using the putty before it had cooled, and in a third instance it might depend upon which part of the putty-bed the material was first taken from—near the sieve or right away from it. Some witnesses were very emphatic that with Buxton lime so much blistering should not arise. For the defence evidence was given that every ton of lime delivered came from Buxton, and witnesses who had used lime from the same consignment found that it answered perfectly well. At length the special jury declared that they did not wish to hear more evidence. To twelve men, the majority of

whom have no special acquaintance with building, the hearing of contradictory evidence imposes a strain on the attention which becomes intolerable. The judge asked if the jury were in favour of the defendants, and on receiving a reply in the affirmative judgment was given for the Aston Junction Company. It is a pity that in this case so competent an authority as Mr. Justice WALTON was not allowed to explain the law on the subject, for there were features in the case of unusual interest.

ALTHOUGH the London Building Act has several clauses respecting dangerous structures, there seems to be no control over the demolition of them. A petty sessions court may, "if of opinion that the structure is in such dangerous condition as to require immediate treatment make any order which such court may think fit with respect to the taking-down, repairing, or otherwise securing the structure." That, however, relates only to exceptional instances. In the demolition of an old house in Tottenham Court Road last week the floor gave way and one of the labourers was suffocated under the debris. At the inquest Mr. C. F. HAYWARD, the district surveyor, said he had no control over the demolition of old premises, which were generally pulled down in a very careless manner. The floor in this case should not have been laden with rubbish unless it had first been shored up. Mr. H. JONES, town clerk of Holborn, said that the borough surveyor had no jurisdiction over demolitions. The jury returned a verdict of "Accidental death," and added:—"The jurors, having heard in evidence that, in the demolition of houses there is danger in loading floors with rubbish unless previously tested and shored up, would condemn such practice, and they further consider that the district or borough surveyor should have jurisdiction over the pulling-down of houses and that, in doing so, all reasonable safeguards should be enforced." It would be no easy matter to obtain an alteration in the Building Act which would give control over the demolition of a building. But the new metropolitan borough should be allowed power to frame by-laws which would deal with emergencies outside that Act.

DR. JOACHIM has imparted a new lease of life to TARTINI's wonderful piece, which is commonly known as "The Devil's Sonata." The violinist therefore secured an interest in music-loving Germany for the picture which he seen in Munich, *Tartini's Dream*, by the painter JAMES MARSHALL. His name indicates that he was of English race, but by birth he was a Dutchman, having been born in Holland in 1838. The picture revealed a weird power, which was the more remarkable, for several of the painter's works are to be met with in churches, and at the time of his death he was engaged on one for the Lutheran church of Leipsic. MARSHALL was a pupil of the wall-painter PRELLER. Some of his paintings are in the Berlin National Gallery, as well as in the Dresden, Meissen and other public galleries. He was appointed professor of art in Breslau, but he could not escape from the power of the waywardness which often afflicts men of genius, and he was compelled to resign his office. His powers declined, and at length death released him from much misery a few days since. He has been introduced as a character in GERHART HAUPTMANN'S "Collegen Crampton."

## RYE AND WINCHELSEA.

THE town of Rye was selected this year as the headquarters of the Kent Archaeological Society's annual meeting.

### Rye Church.

The business meeting over, says the *South-Eastern Gazette*, the members paid a visit to the parish church of Rye, where they were welcomed in the name of the vicar (who is in South Africa) by the Rev. E. H. F. Jenner (*locum tenens*). The architecture of the church was described by Mr. J. Borrowman, jun., A.R.I.B.A. The building, he said, was a large one. Allen's history of Surrey and Sussex spoke of it as one of the largest in the kingdom, and other writers expressed the same opinion. In Horsfield's "Sussex" Jeakes was quoted as calling it the "goodliest edifice of its kind in Kent or Sussex, cathedrals excepted." There did not appear to be any record of the foundation of the church. He understood from Mr. Stenning that at one time it was attached to the abbey of Fécamp in Normandy, and he (Mr. Borrowman) agreed with him that some of the work had a strong French feeling. The church had suffered a great deal by reconstruction at various dates—some no doubt rendered necessary by damage inflicted by the French, the dates given being 1378 and 1448. There had also been neglect to contend with, as well as internal stresses due to the pressure of arches and roof. The measurements of the church were:—Extreme length on centre line inside, 156 feet 6 inches; length of nave, 71 feet 8 inches; width of nave and aisle west end, 57 feet 1 inch; extreme length over transept inside, 77 feet 3½ inches; length of chancel, 60 feet 1 inch; extreme width of chancel and aisles, 69 feet 10 inches. There were the three porches and no less than ten doorways, counting those in use at present and those built up. He considered that in Late Norman times the church was either on the present spot, but all traces of an earlier church had vanished. A great deal of the building was Late Norman and Transitional. He thought there was reason to believe that the usual method of starting the work at the east end was followed, and he should put the date at about 1120. Possibly some of the work was begun rather earlier, as in a built-up passage in the transept he came across a piece of Norman indented moulding somewhat earlier in style than the rest of the work. The upper parts of the transept and the nave were no doubt later, but all would probably date before 1180. The chancel aisles and part of the north arcade were Early English, the work being simple but of great beauty, dating from the beginning of the style, probably about 1200 in the case of the north aisle and about twenty years later for the south. There were some Late Decorated features, and most of the Perpendicular work agreed with the date given for the last destruction by the French in 1448. On the south side of the nave aisle was a Late Decorated doorway of very pleasing character. It led into a vaulted porch now used as a clergy vestry. Above the porch was an upper chamber which he had not been able to enter. He should imagine that this was used by a recluse or anchorite, and in that case it might not have had a door at all, as the window was large enough for the handing in of food, &c. The clock was a most interesting one, dating, he was informed, from 1540, and cost 180*l*. It had a Late Gothic iron frame with buttresses having embattled tops. The chancel consisted of three bays. Externally the building had a great feature in Perpendicular flying buttresses at the east end. It was seldom that flying buttresses were found springing as in this case from piers direct from the ground. The north aisle in the course of its history had been used for a variety of purposes not connected with the church, and had no doubt suffered much in consequence. Among other uses, as far as he had information, were a casual ward for homeless people, a butcher's shop, a fire-engine house and a depository for the town stocks and pillory.

The Rev. G. N. Godwin, B.D., of Appledore, then read a paper on "The Romance of Rye Church." The ancient Briton, he said, certainly paddled his own canoe in Rye waters and hauled his boat ashore somewhere near the present railway station, ate his meal of fish in a wattled hut in the present High Street, and came to the top of the rock to keep a sharp look-out over the surrounding waste of shallow waters. Then later some good but faithful soldier gave thanks over black bread and simple salad, and so the little church arose upon the hill top, and the faith of Christ became dear to the Celts. But when in 491 Ella Cissa besieged Andredsester, and slew all that dwelt therein so that not a single Briton was there left, the little church on Rye Hill perished in smoke and flame. But still the fishing went on, and one year, when the fisher-folk were starving, for no bread could be bought, a stranger came to Sussex—a stranger whom all men now honoured and blessed as the blessed St. Wilfrid. He borrowed the nets of the Sussex fishers, and presently they were full of 300 mighty fishes. Then came the sermon, and Rye Church was once more edified. Into that Saxon church, when Edward the Confessor held sway, there began to come French monks from Fécamp

in Normandy, they now being patrons of the living by Royal gift. These gave the name of St. Mary to Rye Church, in memory of their own stately church of Notre-Dame; the monks dabbled with State secrets, after being treated with forbearance for nearly 200 years, had the gift of Rye recalled in 1246 by Henry III. In the Norman church of Rye a familiar figure was that of John Lackland, brooding over the death of Prince Arthur and the consequent loss of Normandy: that wretched, restless man who changed his dwelling 200 times in a single year. When in 1246 the monks departed they exchanged their 100 salt pans, seven acres of meadow and the wood in which two pigs held revel for the manor of Chiltham, in Gloucestershire, and certain lands in Lincolnshire. "In 1250 the sea flowed twice without ebbing, and moreover the same sea appeared in the dark of the night to burn as if it had been on fire, and the waves to fight and strive together after a marvellous sort so that the mariners could not devise to save their ships by any cunning or shift which they could devise." Fifteen years later "Sir Simon the Righteous" lay dead and mutilated upon Evesham plain with many a brave son of Rye and Winchelsea around him. The same year altars were decked and the church made fair with the spoils of the ships, merchandise and goods of the traders of Bruges and Damme captured at sea by the men of "Winselye," Rye, and others of the Cinque Ports, who had a chronic weakness for piracy. Edward I., the greatest of the Plantagenets, knew Rye Church full well when he was building his fortress town of New Winchelsea, and was so busy therewith that he could not attend to prorogue Parliament in 1295. Eleanor of Castile, his Spanish wife, often prayed within Rye Church, and all the Canterbury pilgrims had been there. Full glad were these latter to ride, in company with the "Rippiers" of Rye, along the many roads to the shrine of St. Thomas of Canterbury. The "Schipman of Dertemonthe," of the barque *Magdelaine*, "who knew well all the havens as they were from Scotland to the Cape of Fynestere, and every creek in Bretagne and in Spain," came to church whenever he was in port, and Godwin of Rye, whose fortune the devil once made in a fit of good-humour, was, it was recorded in the British Museum, a regular attendant. Augustinian and Carmelite friars were familiar figures alike in the church and town, and many a miracle play had the church walls beheld, which plays were repeated at Lydd, Tenterden and the Romneys. In 1522 they read, "Paid for a coate made when the Resurrection was played at Easter for him that, in playing, represented the part of Almighty God, one shilling; ditto for making the stage for the Resurrection at Easter, three shillings and fourpence." In 1380 Rye was raided by the French and laid in ashes, the raiders even wrenching the bells from their fittings in the church and carrying them captive to France. But the men of Rye and Winchelsea, smarting under the dire disgrace, sailed for Normandy and, carrying fire and sword into both the coast and inland towns, afterwards rescued and brought home the bells, and once more they sounded out from the church tower. Rye had ever been the resort of strangers, and from 1538-44 mention was made of the burials of a Fleming, a Frenchman, a Spaniard, two Portuguese, a Dutchman and several men and boys from Scarborough, while all through the register occurred the words "Buried, a stranger." Fain would they believe that the altar in the St. Clair chapel came from the Armada as likewise the clock, but those legends must go, though it might well be that the altar was a Spanish prize captured by the privateersmen. Many a Huguenot worshipped in the church, and "Denis Duval" said, "Three miles off at Rye is another colony and church of our people, another fester burg where under Britannia's sheltering buckler we have been free to exercise our fathers' worship." In 1573 the bells rang merrily on the coming of Queen Elizabeth, and in 1642 the rumbling of the guns brought from Camber Castle by Captain Richard Cockeran and the men of Rye in the interest of Parliament was heard in the church. Admiral Blake was there in the stirring days when a hundred sail of the line lay at Rye, and Queen Anne, whose arms were to be seen in the church, was a great benefactress of it. Sainly John Wesley had paced the aisles and prayed in the church, and to this very day romance hung around it, for it was in charge of one (the Rev. E. H. F. Jenner), who had served his Queen and country at home and abroad, and its much esteemed vicar was still doing duty in Natal.

Under the guidance of Mr. Harold Sands and the Rev. G. N. Godwin the town was perambulated and the more interesting of the old buildings referred to. The two guides differed with regard to the Ypres tower, the Rev. G. N. Godwin attributing it to William de Ypres, Earl of Kent, who lived in the time of King Stephen, and Mr. Sands considering it to be of later date, probably about 1376. Having described the dimensions of the tower, Mr. Sands mentioned that the Corporation bought it in 1495, and that until 1891 it was used as a gaol. Proceeding, Mermaid Street was visited and a brief halt taken at the old house of the Jeakes in Baddyng's ward, reputed to be one of the oldest houses in Rye. Originally

this was the chapel of the Carmelite Friary, and it was one of the few buildings which escaped being burned by the French in 1378. It is now called the Old Hospital, because it was used as a hospital for prisoners during the French war. Opposite, Mr. Godwin called attention to Jeakes's storehouse, with its record of the position of the planets at the time it was erected. The old Mermaid inn—originally a large house running round a square courtyard with galleries—was next inspected, and moving into the High Street and thence to Cinque Ports Street Mr. Sands pointed out the remains of the town wall. The crossway on Conduit Hill, Mr. Sands said, was the spot where the postern gate once stood, and a little higher up were the remains of the chapel of the Austin Friars, or Friars Eremites, an order introduced into England in 1250. The chapel corresponded with the English Perpendicular period, but there were three beautiful Flamboyant tracery windows on the south side, windows which were very unusual in England. Coming near to the Landgate, Mr. Sands remarked that this was the finest landgate remaining in the south of England with the exception of Westgate at Canterbury. It formerly had a portcullis or drawbridge, and the remains of a fine stone machicolis were to be seen over the gate. Edward III. granted the license to fortify the town and build the gate in 1369, and low arches were cut through in the west tower below the loops for early cannon. Mr. Sands also pointed out the original line of the town wall, which ran from Westcliff end to the Strand Gate, and from there round to Baddyng's Gate. This gate was with several streets washed away, the town and cliff formerly extending over 100 yards further eastward.

#### Winchelsea.

Having partaken of lunch, the members were conveyed to that delightful old-world town, Winchelsea, where they spent a very pleasant time. At the parish church they were welcomed by the rector, the Rev. J. Patch, who briefly described the building. The church was anciently dedicated to St. Thomas à Becket. The only part now remaining was the ancient chancel, the nave having long since disappeared. The church was originally cruciform with a central tower, but there was no proof that the nave was ever actually completed. The town suffered at various dates from the French, and it had been suggested that in 1380 what was then existing of the nave was destroyed by the raiders, and that it was never afterwards rebuilt in any shape or form. The five monuments of the church were beautiful and extremely interesting. In Alard's chantry there were two to members of the Alard family—Stephen Alard, who was admiral of the Western fleet and Warden of the Cinque Ports about 1324, and Gervase Alard, who was the first to bear the title of admiral. The time of the latter was about 1303—nearly the same date as the church itself, 1288. Both monuments, which were originally richly coloured, were now considered unsafe, and would have at some future date to be reset. The remaining three monuments were in Farncombe's chantry, but half of one of the three was cut off from view by a thick wall erected for an unknown purpose. It was conjectured that the monuments were those of one of the Alards, his wife and only son. In what was now the chancel very interesting features in the form of a piscina and sedilia were discovered about fifty years ago on the removal of the pews belonging to the Mayor and Corporation of Winchelsea. It was thought that the wall he had mentioned might have been built from stones taken from the campanile, which stood in the churchyard till 1790, and that it was intended to put the bells upon it. Provision was made for them, but they were never hung. The tower was of much later date than the church. Whether any of the stones from the campanile were used in it, or whether the whole went for the building of Rye harbour no one really knew.

Under the guidance of Mr. Sands the members next strolled around the town inspecting the ancient mural defence of the place, while the Rev. Mr. Godwin pointed out numerous places of interest and gave information in regard to them. Starting from the Strand Gate Mr. Sands mentioned that old Winchelsea stood on a low, sandy island about the mouth of the present Rye harbour. The old town was partly swept away in a great storm in 1252, and the new town was founded by Edward I. in 1281, the charter being transferred to the new town. While the new town was building King Edward I. visited the place, and his horse being frightened by a mill leaped over the wall, to the consternation of the onlookers. By a daring piece of horsemanship, however, the king pulled up, and riding up one of the zigzag paths, was heartily cheered by his admiring subjects. The king reserved a site of some 10 acres in extent for a castle, but the only remembrance of it was the Castle field. Until 1828 there stood to the north-west of the Pipewell, or Ferry Gate, a large circular tower, called the Roundell, occupied in mediæval times by the harbour master. The Strand Gate itself had two drum towers and a central chamber above the wide span arch. The new gate on the Pett Road was now only represented by the remains of the lower part.

Close by this gate were the remains of the town ditch, the original Land, or Pipewell Gate on the Udimore Road was destroyed in 1380, and much damage was done to the walls when the French burned the town. The present Pipewell Gate was rebuilt by the then mayor, John Helde, in 1404. Camber Castle, which could be seen some little distance off, Mr. Sands explained, was built by Henry VIII. for artillery to guard the Camber, or harbour, of Rye and Winchelsea jointly. Mr. Godwin, in taking the members round, pointed out Miss Ellen Terry's cottage, the spot where Millais painted *Blind Girl*, showed them the famous cellars built in years ago by for the Gascony wine trade—one so large that Volunte had drilled in it—and a host of other deeply interesting places. He also pointed out the houses erected by the Huguenots, the old bear-baiting square, the remains of the Black Friars' monastery, the zigzag paths which were the only approaches when the place was practically a pirates' stronghold, and the position of the old harbour of Winchelsea, running round to the back of the town.

At the evening meeting two addresses were given, one by Mr. P. M. Johnson on "The Old Timber Houses of Kent and Sussex," the other by the Rev. W. Marshall on "The Woods and Roofs of Our Churches." Both were illustrated by means of lantern-slides. Mr. Johnson made an appeal to the Society to do its utmost to save the old timber houses which were dotted about the county of Kent. Unless some special attention was paid them they would, he was afraid, vanish rapidly. He knew of no complete house of the thirteenth century either in Kent or Sussex, but there were far more of the fourteenth century still remaining than many people supposed. Votes of thanks brought the meeting to a close.

#### RESTORATION IN VENICE.

THE correspondent of the *Scotsman* writing from Venice on the 2nd inst. says:—I am able to date this, although I am hardly able to tell the hour of the day, for since our Campanile fell our usual mid-day and nine o'clock evening time-gun has ceased firing, and since the "Commission for the Inspection of Monuments" has done its work, the bells in not a few of the other campaniles have been condemned to hold their tongues. Before, however, speaking of the work of the "Commission," let me give a few details regarding our "felled" Campanile.

The sifting and separation and removal of the 18,000 tons of debris goes on apace day by day from 5.30 in the morning till 7.30 in the evening. The work is done mainly by soldiers under the direction of two active young lieutenants, although a few civilians take their place while they rest in the middle of the day. On the spot, ancient bricks, modern bricks, marble and useless material are all separated. The latter is wheeled to the Riva dei Schiavoni and emptied into peati (large boats which, when full, a steamer tugs away out into the Adriatic Gulf, where the material is consigned to a watery grave. With the first boat-load went wreaths and flags, and it was consigned to the deep with almost funeral rites. The marbles and bricks are taken to the islands of San Giorgio Maggiore and Delle Grazie, but the most precious of them are taken into the quadrangle of the Doge's Palace, or into the office of the Commendatore Boni.

In the last-mentioned place Commendatore Boni shows me the other day a Roman brick, with the inscription "Im. Anto. Aug. Pius," which, of course, stands for Imperator Antoninus Augustus Pius, who reigned from 138 to 161 A.D. For his good qualities the Senate gave him the title Pius. Here then, is a brick in good condition that was made 1,750 years ago. Another brick had the letters T.A.M. clearly and deeply cut. One from Eraclea had the letters G.S.M.N. on it. The Aquileian bricks are of all shapes and sizes, some round and others as large as square paving tiles. Comm. Boni has polished a piece of a Roman brick, and one can hardly distinguish it from a piece of red Verona marble.

I said in a former article that the lime was bad, but it was not all equally so, for enormous masses of brick wall, weighing from 1 to 5 tons, are being discovered. The bricks comprising these masses it is almost impossible to separate. This has induced Comm. Boni to suggest that they should be taken entire to the public gardens, and there made into a sort of memorial monument, with the date of the Campanile's death—July 14, 1902. Signor Arbib, an Armenian who resides in Venice, offered 500 francs (20*l.*) for one of these blocks to place in his garden. Comm. Boni, although averse to making merchandise of the poor Campanile's remains, has yet written to the Minister Nasi and to the Syndic of Venice on the question of disposing thus of relics of the disaster.

The big Marangona bell is now deposited in the Doge's Palace, and it bears the following inscription:—"Sanctus fortis sanctus et immortalis, miserere nobis. Verbum caro factum est. Cancione Venete Fusoris meus, pondo lib. 7,600 Rifusione, terza nona Dicembre 1819."

Yesterday the great copper-gilt angel was examined, and inside it was found a glass bottle unbroken, with a parchment inside. The cork of the bottle had a string over it, and a seal of red wax with the one word, *Biblioteca* (perhaps for *Biblioteca Marciana*, St. Mark's Library). The parchment bore the following inscription:—"Curantib. xviris. præpos. fabr. Basil. Marcianæ Aloysius Zandomenighi Bonar. artium acad. magister opus finxit Barth. Ferrari Ant. Bosa socii idem probarunt. Joan. Casadoro sculptor sig. Franciscus Carissimi faber ferr. exequuti sunt, Gaspare Biondetti machinar. ad erectionem structore Caesare Fustinelli archit. omnia moderante. Venetiis A. MDCC. XXII. Emanuelis Ciconia." The first angel was, however, set up in 1517.

The four bronze statues—*Apollo*, *Minerva*, *Pace* and *Pallas*—that stood in niches by the bronze doors of Sansovino's Loggetto have all been found, and though *Apollo*, the last discovered, is the worst broken, the head, legs and hands being severed from the trunk, still all can be put together again.

The removal of the debris is now sufficiently advanced to show that the upper part of the Campanile fell in a direct line with the main door of St. Mark's, hitting the pavement of the Piazza about 50 feet from the church, and sending the angel almost in at the open door. But what a fall. At this point the pavement goes down into a pit, the flags being forced up all round. The Piazza resembles a wave of the sea, with its high, rounded crest and deep trough. How deep the trough is has not been ascertained, but the slope is 1 in 20. It happens that at this place there were drains, water and gas pipes, &c., so that the Piazza was partially a hollow.

Commendatore Boni does not think that the foundations of the Campanile have been at all injured, but in any case he will enlarge them, as they were not laid down at first to carry such a high and weighty tower as the Campanile was. At present they cover 200 square metres; he proposes enlarging them to cover 400. Money is coming in for the rebuilding more slowly than at first, but steadily, and it is expected soon that the sum of 2½ millions will be reached. Although it is, I believe, certain that the Campanile will be rebuilt where it was and as it was, still many people would like to see it built elsewhere—say, where the present unsightly patriarchal palace stands—so as to leave the great Piazza of St. Mark's free, and also to do away with the dwarfing of church and Doge's Palace, which was one effect produced by the Campanile standing where it did.

The damage to the Royal Palace is much more severe than was at first believed. The whole angle to the extent of 20 yards on either side is railed off. King Victor Emmanuel has signified his desire to bear the expense of this restoration.

To pass now to the report of the Commission for the Inspection of Venice Monuments. The fall of the Campanile suggested the thought that other towers and buildings might be in an unsatisfactory state, which has unfortunately proved to be the case.

1. *The Doge's Palace*.—I am not aware that anything new threatens its stability, but the weight of the books of the Marciana Library must be removed. As the old library—the Zecco (Mint)—is not ready to receive the books—indeed, the contract for its adaptation has but just been signed—the books will be taken to the Capella Nicoletta, a chapel attached to St. Mark's and the Doge's Palace, at once. This will cause some inconvenience and expense, but it will at once relieve the strain on the palace.

2. *The Procuratie Vecchie*.—This name is applied to the noble pile of building that forms the north side of the Piazza of St. Mark, and which is flanked at its eastern end by the famous Clock Tower. It is a colonnaded building, and in Gentile Bellini's picture of the Piazza, painted in 1496, it consists of the porticos below and one storey only over them. Now, of course, it is a storey higher. Many buildings in Venice have thus been enlarged on the old foundations, not meant to carry extra weight. Until the fall of the Republic the Procuratie Vecchie belonged to the State, and were used as the offices and dwelling-houses of the most honourable class of men in Venice, from amongst which the doges were always chosen, the Procurators of St. Mark. Afterwards they were sold to private individuals, and now they are used as shops and warehouses, cafés and hotels.

What then has happened? Inner walls have been taken down. Doors have been made here and windows there. The whole internal arrangements have been altered to meet the needs of trade and commerce. Besides which tons on tons of goods, a large part of which is glass, are stored in them. It is no wonder if then the old "Procuratie" feel the strain, and show signs of decay. Cracks have appeared, and though there is no danger of collapse, none whatever, still work of restoration is urgently needed. Commissioner Boni said he should like to see them turned into dwelling-houses, thus restoring them in great part to their original use.

3. *The Campanile of S. Stefano*.—The church and campanile and monastery of S. Stefano (St. Stephen, the proto-

martyr), dates back to the thirteenth century. They have a special interest for Protestants, for, as they were the only Augustinian buildings in Venice, Luther lodged in the convent, and it is believed preached in the church, on his way to Rome. Also the campanile has its special interest, for the upper half having been destroyed by lightning in 1585, and the very bells fused, four new bells were brought from England, from a destroyed Roman Catholic church or monastery.

The upper half of the campanile was rebuilt and the new bells hung, but it is precisely this part that now threatens to fall. It is nearly 6 feet out of plumb. The foundations and original part of the campanile are quite sound and safe, although the whole structure has been sinking during the past twenty years one centimetre a year. Commissioner Boni has ordered the demolition of the newer upper half of the campanile. At once the ringing of the bells was stopped. The people in the houses round the campanile, some thirteen families in all, have been removed. This was done not solely on account of the dangerous nature of the campanile, but because the houses themselves are in a state of complete disrepair.

4. *The Campanile of St. Barnabas*.—The church and campanile of St. Barnabas, the Son of Consolation, were first erected in 809, so they are one of the earliest foundations in Venice. They were burned in 1105 and rebuilt. The campanile was often struck by lightning, the last time about six years ago. On this account it is shorter than it once was. Commissioner Boni and the other members of the Commission have discovered that near its base there are cracks and bulgings. They have therefore ordered the cessation of the ringing of its bells, and they contemplate immediate repairs.

5. *The Campanile of San Francesco della Vigna*.—The name "San Francesco della Vigna" carries us back to the first century, for it was on the place so called that the evangelist St. Mark was wrecked in his boat as he was returning from Aquileia, and where he received the vision of an angel, who said, "Pax tibi, Marce, Evangelista meus" (Peace to thee, O Mark, my Evangelist), adding that a great city would one day arise in his honour, which was fulfilled when Venice was founded in 421 and dedicated to him in 829. It was an island covered with vineyards (*vigna*), in one of which a church was built in the ninth century to St. Mark, which was only destroyed in 1810. So up to that date there were two St. Mark churches in Venice. However, long before that monks of the Order of the "Minori Osservanti" had built a large church and monastery, and it is the campanile in connection with that later church of which we speak. It is a tall, rather slender, handsome structure, erected in 1581. It was struck by lightning in 1758 and restored in 1760. The "Commission" finds that this campanile stands in need of strengthening. Its bells, too, have been ordered to be quiet. Commissioner Boni says it may have been built too near the banks of some old canal. That sometimes accounts for movements and shiftings of buildings.

6. *The Bell Tower of the Arsenal*.—Even in the Arsenal itself buildings exist—walls of old shipbuilding yards and towers—that stand in need of repair, as they go back to the early years of the eleventh, twelfth, thirteenth and fourteenth centuries. The bell tower, that in which hung the modern "Marangona," that called the workers to their labours, has been condemned to undergo repairs. The bell has been swung to the topmast of a ship, and meantime does duty there.

7. *Church of Mater Domini*.—The church and campo of Santa Maria Mater Domini go back to 960. I always look upon the houses of the campo as the oldest in Venice. They have Byzantine windows, with a touch of Gothic, marking a transitional period, and above the apex of each window are crosses and animals and other Byzantine symbolism. The houses have deep projecting eaves, as those of Marco Polo have, and one goes down steps to enter the ground floor, the level of the campo having changed. The houses belonged to Zane, who was involved in the Trepola-Querina conspiracy, and the old well bears the Zane stem—a fox. The Council of Ten ordered in 1488 the destruction of the portico of the church, for a reason that throws a lurid light on the evil habits of the young Venetians of that period. The church contains some good pictures by Tintoretto, Calena and others; but it is dark and low and dismal, and the Commission report it to be in a positively deplorable condition. It will have to be closed, and thoroughly overhauled and restored.

8. *The Church of the Miracoli*.—This church of the Madonna Dei Miracoli is considered one of the most beautiful Renaissance churches in Italy. It was erected in 1484-89 by Pietro Lombardo, and it is encased outside in black and white marble. Inside it has a raised choir. It was closed for many years, and was reopened only in 1886, after having undergone repairs. It has a large dome roof, and this, it appears, is faulty in some ways. Accordingly, the Commission on Public Monuments has ordered the closing of the church and the doing of what is necessary to preserve this wonderfully beautiful little building.

9. Lastly, as might be expected, the Ghetto has called the attention of the Commission. This place not far from the railway station, on the Canal Canareggio, was originally the site of great public foundries; hence, it is said, the name Ghetto, from "gettare," to cast. Here the Jews were confined in 1516, and the name has become a general one for Jews' quarters. The houses here are very old and very high; some are regular "sky-scrapers," going up ten storeys. It is not to be wondered at that some of those houses have been condemned. They look dangerous even to the eye. The Jews are taking care of the expelled families, for the Ghetto is still a quarter for the poorer Jews. The synagogues are there. But the richer Jews are all over Venice, inhabiting the best palaces, as they are at the top of the tree in most professions. I can hardly think the condemned houses can belong to Jews, for whenever I see a house being put in order I am sure that a Jew has bought it.

The work of the "Commission for the Inspection of Venice Monuments" is almost over. In any case, nothing remains to be revealed in regard to Venetian campaniles, churches and houses than what I have made known. One naturally says it is enough. It looks formidable and alarming, but it is in reality not much.

When one thinks that Venice was founded 1,500 years ago; that it is built in the sea; that its houses have no natural solid ground to stand on; that every building rests on piles driven deep down into the shifting mud and sand; that all its structures, even St. Mark's Church and the Doge's Palace, are only built of brick dried in the sun or burned in the old guidecca kilns; that since the fall of the Republic in 1797, and even before that, Venice was but a playground, no serious care being taken of anything; that it is only really within the last thirty or forty years, since the unity and freedom of Italy was established, that public monuments, even like St. Mark's Church, are being cared for at all—when one thinks of all that, instead of being surprised that some of its spires and towers, its churches and houses, need more or less radical reparation, the wonder is that the city as a whole stands solid and strong, full of beauty of architectural design, full of marvellousness in skill of execution, a unique city, worthy of its unique history, as once the mistress of the seas, the Queen of the Adriatic.

### THE CONTESTED GOLD ORNAMENTS.

By ROBERT COCHRANE, F.S.A., M.R.I.A.

IN a remarkable paper by Mr. A. Evans, M.A., F.S.A., "On a votive deposit of Gold Objects found on the North-West Coast of Ireland," published in *Archæologia*, vol. lv. pp. 391-408, it is recorded that "the spot where the treasure was found is near the sea, on the north-west coast of Ireland." So much of interest attaches to the place and circumstances of this find, that the following details seem deserving of record; they will add to the scanty information as to locality given in Mr. Evans's paper.

The ornaments were found in a field on the farm of Mr. Joseph L. Gibson, in the townland of Broughter, parish of Tamlaght, barony of Keenaght, and county of Londonderry. This townland formed part of the estate of the Worshipful Company of Fishmongers of London until it was sold to the tenants a few years ago. At a visit to the place on May 22 of the present year, accompanied by the Rev. Joseph M'Keeffry, M.R.I.A., and Mr. S. F. Milligan, M.R.I.A., Mrs. Gibson, in the absence of her husband, kindly pointed out the spot in the field where the objects were found, and mentioned that this field was formerly divided into two by a fence and ditch, levelled some years ago. The northern portion of the field, before the fence was removed, was known as the "Church Field," and it was on the site of the fence enclosing this field that the objects were ploughed up in the year 1896.

Two ploughmen, named James Morrow (since deceased) and Thomas Nickle, were engaged subsoil ploughing—the second plough followed the first in the same track for the purpose of turning up an increased depth of the soil; the process is called subsoil ploughing, or subsoiling. The second plough exposed the objects, and, in doing so, slightly injured one of them—the boat.

The find consisted of—(1) a representation of a boat of the currach type, in part like those on the river Boyne, but with the ends more pointed and in part like the currachs of the west coast; (2) a bowl or cup; (3) small chains of gold, and (4) a hollow collar of gold, a twisted necklet and the fragment of another necklet. These objects became the property of Mr. Robert Day, F.S.A., M.R.I.A., of Cork, and from him they were purchased by the Trustees of the British Museum.

On the Sunday after the day of the find one of the ploughmen, James Morrow, in walking over the spot where the objects were discovered, picked up a broken piece, believed to be a missing portion of the boat, which he gave to his sister, who sold it to a jeweller in Londonderry and it is not now available for description.

From Mr. Evans's paper above referred to, I have taken the following measurements and weights of the various articles:—

1. The boat measures  $7\frac{1}{4}$  inches long by 3 inches broad and weighs 3 ozs. 5 dwts.; it had nine seats for the rowers, which only eight now exist (the ninth having been disposed of to a jeweller, as before mentioned). The boat is formed of sheet of pale gold plate divided and rejoined at prow and stern. There are some faint marks on the sides having the appearance of ribs, which may have been meant to indicate the frame work covered with hide or canvas. Adamnan, in his "Life of St. Columba," mentions such boats were in use at Iona in the sixth century. The ribs and frame were of wood, covered with ox hides, tanned with oak bark; sometimes three layers of hides were used. Adamnan mentions that these boats carried full sails. The central seat had a hole into which a small mast was secured; the rowlocks were formed of wire rings. Fifteen small oars about  $2\frac{1}{4}$  inches in length were found, and steering oar. Mr. Evans says:—"Besides the oars there were found a miniature grappling-iron, with four hooks, a boat hook and three forked implements, which may either be fishing spears, or, more probably, forked barge poles, such as are still in use."

2. The bowl measures  $3\frac{1}{2}$  inches in diameter and about 2 inches in depth; it is of semi-globular form beaten out of plate of pale gold, and weighs 1 oz. 5 dwts. 12 grs. Four small rings are let into the rim, at equal distances apart, evidently for the purpose of suspending the bowl.

DETAIL OF ORNAMENT ON GOLD COLLAR, SHOWING DIVERGENT SPIRAL PATTERN (Plan of Fastening at Top of Figure.) ( $\frac{1}{4}$  Linear.)

3. The Chains.—The following is an extract from a lengthy description by Mr. Evans:—

"The larger chain consists of three separate strands, each

\* *Archæologia*, vol. lv. p. 392.

† *Op. cit.* p. 394.

formed of quadruple links, joined together by what may be called the bolt ends of the necklace. It is  $14\frac{1}{4}$  inches in length, of a dull gold, of different alloy from that of the boat and bowl, and it weighs 2 ozs. 7 dwts. The fastening is a regular bolt, a double pin sliding in and out of a loop. The outside of this lock is ornamented with granules, some of them arranged in pyramids of three. The chain itself is of exquisite fabric and the links are all spirally twisted. The smaller chain, which is  $16\frac{1}{2}$  inches in length, consists of a most complicated plaitwork of eight wires. It weighs 6 dwts. 12 grs., and is of the same poor gold as the other. Its fastening is on the same principle."

In general character these chains resemble the silver chain attached to the Clonmacnoise brooch-pin, described and illustrated by me in the *Journal of the Royal Society of Antiquaries of Ireland*, vol. xxi. p. 318.

4. *The Collar*.—This ornament is a most remarkable specimen of its kind, and is of the so-called "late Celtic" period. The collar when closed would form a circle about  $7\frac{1}{2}$  inches in diameter, the hollow ring or tube measuring  $1\frac{1}{2}$  inches in thickness. It was formed of two plates of gold, which corresponded exactly with each other, and were folded over and soldered together on an internal core now removed. A portion of the collar for about 2 inches in length is missing. An ingenious attachment is formed at each of the ends for the purpose of fastening them together; a projection at one extremity is inserted into a slot at the other end, which locks it until one end is turned at right angles to the other to open it. The decoration is formed of repoussé work of beautiful design, with lines of divergent spiral pattern grouped together most harmoniously. Between the lines of the raised pattern the vacant space or background of the design is covered with finely-engraved concentric lines sunk in the surface; they appear to have been executed with the aid of a compass. The period between the late Celtic of, say, the first century, and the Christian trumpet pattern of the seventh and eighth centuries, has not yet been filled up, and the older style of ornament survived longer than is generally thought. In "Notes on Irish Architecture," by Edwin, third Earl of Dunraven, edited by Margaret Stokes, at page 199, vol. ii. is the following, which bears on this point:—"This is termed the divergent spiral, or trumpet pattern, and its appearance in the art of Ireland from the bronze works of the Early Celtic period found in the stone tombs of a prehistoric age to the capitals of Cormac's chapel, stamps the architecture of Ireland with a distinctive native character. Living on in Ireland when it had died out elsewhere, this design, in course of time, appears upon her buildings."

In addition to the foregoing a twisted necklet or torque, about 5 inches in diameter, was found. It weighs 3 ozs. 7 dwts. 9 grs.; also the fragment of another torque of similar design, weighing 1 oz. 10 dwts. 4 grs.

The object of this paper is the more particularly to describe the locality where they were found and its surroundings, from which some light may be thrown on the subject of these ornaments being *ex voto*.

I have already mentioned that the northern half of the field within which the objects were found is still known as the "Church Field." A field immediately adjoining to the westward and between the "Church Field" and the sea is known on the farm as the "Graveyard Field," and in the latter field bones are frequently dug up. There is a tradition in the neighbourhood that a monastery once stood here, and these circumstances would tend to show that an ancient ecclesiastical foundation at one time existed at this place. If so the monastery must have been one of the early Celtic type; there are no historical accounts that I am aware of recording such a foundation.

The next subject for investigation is the name of the townland. Broighter at first sight looks puzzling, and not likely to yield any satisfactory results. Local inquiry and the aid of the Ordnance Survey maps showed that the townland immediately south of Broighter is named Broglasco, and the next townland is named Broharris. The prefix Bro to three townlands suggested the derivation of each: thus Bro-glas-co, or Brogh-glas-chuaidh, means the "Brugh, or Great House of the Green Hollow." This townland is considerably lower as regards level than Broighter. In Broharris, which seventy years ago, according to O'Donovan, was called Broharri, we have evidently in the latter part a proper name; and in Broighter, or Brogh-iochtar, we have the Lower Brogh or Great House. The term "lower" does not apply to level or relative height; it indicates the northern position with reference to the other Bros. I have had the advantage of Dr. Joyce's valuable assistance in arriving at these derivations. As regards level or height, the townland of Broighter is higher than the lands lying to the south and west of it.

As to the other physical characteristics of this townland, it was formerly bounded on the west by the strand and shores of Lough Foyle. An embankment was made here some years ago which reclaimed a large tract of country. Some unneces-

sary misconception seems to exist as to the extent and situation of the land reclaimed from the sea. The embankment referred to was finished about the year 1855 under the Act of Parliament for the construction of the Londonderry and Coleraine Railway, which in some places ran through the slob lands of Lough Foyle. The contractor for the railway (Dargan, of the first Dublin Exhibition fame) got the reclaimed land in part payment for making the line. No portion of the townland of Broighter was included in this or any other reclamation scheme. The reclaimed portion immediately west of Broighter now forms a separate townland, for which it was necessary to invent a new name, and it has been called "Ballykelly Level," Ballykelly being the name of one of the townlands adjoining.

The townland of Broighter, though low-lying—the highest portion of it is under the 25 feet contour line of the Ordnance Survey—could not have been under the sea-level in the historic period. Its name, with the prefix Bro, goes back to very early times, and it undoubtedly came into use in the pre-Christian period. Brugh, or Brogh-na-Boinne, was the name applied to one of the chief cemeteries of pre-Christian times, and it still survives, in the names "Bro Farm" and the "Bro Mill," at Newgrange, on the banks of the river Boyne, near Drogheda.

I would take it therefore that the name was applied to this place in pagan times, and it was then solid land; also that at an early period after the introduction of Christianity a religious establishment was founded here of the older Irish type, a church with a few cells, probably wattled huts, surrounding it, in which the monks lived, each in his own cell, in the early monastic fashion, and it probably survived until the introduction of the later monastic orders. However this may be, the only thing certain is that some such establishment existed, and that it has been completely blotted out of existence and forgotten save in the local tradition. I would not, however, be disposed to rely too much on "local tradition." While fully appreciating the value of such evidence when properly investigated, I have too frequently, in my experience, found it can be "made to order." It is natural to connect the find with the establishment said to have existed here (which existence the place-names before referred to fully verify), and before its downfall its treasures may have been buried in the site either accidentally or by design and remained there until recently recovered.

The question arises as to how this place could have become possessed of such treasures. The answer to this is plain. The custom of making votive offerings to churches of articles of value has been practised in the Western Church from the earliest times, and these golden ornaments may have formed part of the church treasury of Brogh-iochtar, which probably suffered the usual fate of monasteries in Ireland at the hands of the Danes. In the ninth century alone the recorded invasions of the country along this coast are not less than four in number, viz. A.D. 822 (Banagher plundered), A.D. 839, invasion of Turgesius (Maghera plundered), A.D. 841 and A.D. 861. Broighter lies between the sea and Banagher. We find recorded in the "Annals of the Four Masters" that the Danes plundered the neighbouring churches of Enagh, Clooney and Dergbruagh in 1197; and in 1196, according to the "Annals of Boyle," the altar of the great church of Derry "was robbed of 314 cups esteemed the best of their kind in Ireland."

Reverting again to a consideration of its geographical position, we find it lying within a mile of the river Roe, and about two miles from the famed hill of Drumceat—Drum Cette—at which the great convention of that name was held in A.D. 575, according to Dr. O'Donovan, or in 596 by Dr. Reeves.\* This hill is now named "Daisy Hill," or the Mullagh, and the name Drumceat has disappeared. The name of the hill, as given by Colgan, is Drui-m-Cette, pronounced Drum-Ket-ta. The word Drumceat was first used by Dr. Reeves. The disappearance of the name has given rise to doubts as to whether the hill in Roe Park, now called the Mullagh, was the original hill on which the convention was held. The Most Rev. Dr. O'Doherty, in an able pamphlet published by the Catholic Truth Society, gives it as his opinion that the convention was held not on the Mullagh, but on the hill of Enagh, on the opposite or eastern bank of the Roe. It is recorded that the convention was attended by 10,000 or 12,000 persons, called together by Aed Mac Ainmirech, king of all Ireland, who came from his residence at Aileach, and the assemblage consisted of the other kings, chieftains, nobles, with the clergy, bards and a great following of horse and foot. The two hills are not half a mile apart, and it is evident that such a numerous party, encamped for upwards of a year, must have covered both hills and all the intervening ground, and the ground along both banks of the river for a considerable distance, including the site of the ancient town of Limavady. It would, therefore, be equally correct to describe the meeting as

\* Colton's "Visitation of Derry."

having been at either place—the Mullagh or the Enagh. The hill in Roe Park, now called the Mullagh, is 182 feet above Ordnance datum, and it gives its name to the townland in which it is situated. The ridge is formed by glacial deposits of gravel, and is an "Esker" similar in most respects to those in the chain of Esker drifts which run east and west across the central plain of Ireland. The end of the ridge is called by the more modern name of "Daisy Hill."

The word drum, or ridge, correctly described this hill; cetto, or cette, I take to be a proper name. The ridge runs nearly due north and south through the demesne of Roe Park for a distance of 460 yards. At its southern end there are indications of an artificial formation, where the top of the ridge has been cut off and a level plateau of irregular oval shape, measuring about 200 feet by 100 feet, has been artificially formed. The excavated material was deposited chiefly at the northern end, where there is a considerable artificial slope but no fosse or ditch. This elevated platform is not surrounded by such protection, and in this respect is unlike most other earthworks of the kind that I am aware of. Some burial mounds have no enclosing ditch, but this is not such a mound. It seems constructed for the purpose of allowing a large number of persons to collect on the level top. This they could not have done with facility on the natural ridge.

The change of name from Druim Cette to the Mullagh could be accounted for by the structural change; it ceased to be a drum or ridge, and became the Mullagh—that is "The Hill" par excellence—after the famous convention had been held there. Possibly the structural change had been made in it to facilitate the holding of the convention.

This is somewhat of a digression, but it is desirable to locate the position on the banks of the river Roe on which the meeting was held. The length of the river is about eight miles from the Hill of Drumceat to the sea, and it is navigable for boats, there being no ford or obstruction for the whole of that distance. At Drumceat there is a ford which, no doubt, was used by the multitude at the convention. There is no ford between it and the sea, and the river, though navigable below, except in very dry periods, is not navigable above Drumceat.

It is recorded by Colgan that St. Columba, with the Scottish king, attended this convention uninvited, and that he sailed from Iona, was nearly shipwrecked in Lough Foyle, near the mouth of the river Roe, and, by a miracle, his frail barque was brought on a flood up the river. Eventually he was enabled to land in safety near the Hill of the Convention to attend and take an important part in the proceedings. Dr. Reeves, in his "Antiquities of Down and Connor" (Appendix), says:—"In the year 596 was convened a council at Drumceat, on the river Roe, one great object of which was to arbitrate between the respective claims of Aedh, king of Ireland, and Aidan, king of the British Scots, to the kingdom of Dalriada, in Scotland. And hither Columbkille also came from his monastery at Hy, attended by a company, which is thus described by his contemporary, Dallan Forgaill:—

'Two score priests was their number,  
Twenty bishops of excellence and worth,  
For singing psalms—a practice without blame;  
Fifty deacons and thirty students.'

(See also Connellan's "Annals of the Four Masters," notes by MacDermott, pp. 51, 246, 439, 550 on this convention.)

O'Curry mentions that the Irish king, Aedh, had "invited" St. Columba to be present at this convention. See p. 77, vol. ii. "Manners and Customs of the Ancient Irish":—"This great meeting was attended by all the provincial kings, and by all the chiefs and nobles of the island; and Aedh invited over from Iona the great patron of his race, St. Colum Cille, to have the benefit of his wise councils in the discussions." But at p. 245, vol. iii. "Manners and Customs of the Ancient Irish," it is said:—"St. Columbkille, having heard of this meeting and its objects, and being a great patron of literature, came over from his island home at I, or Iona, whither he had retired from the world to appease the king and the people, and quite unexpectedly appeared at the meeting. The poets at this time, with Dallan Forgaill as their chief, were collected in all their numbers in the vicinity of the hill of meeting anxiously awaiting their fate, but their anxiety was soon relieved, as their able advocate had so much influence with the monarch and his people as to procure a satisfactory termination to the misunderstanding between them and their poets."

There are other historical references to the visit of St. Columba to this place at this time, which need not be here quoted, as the fact of his being present is undisputed.

The incidents of his journey to the place of meeting are worthy of attention. It is recorded that the saint, after sailing across Lough Foyle, turned his vessel to the river Roe, and that, with the Divine assistance, it glided up the stream, which with the scantiness of its waters would otherwise not have been navigable so easily. The saint landed very near Drumceat, at a place which was named Cabhan-an-Churaidh, or "hills of the boat."

There is a rock in the river at Roe Park called the "boat rock," and there is a pool called the "boat hole." I have not heard that either of these places have been connected by tradition or otherwise with St. Columba's visit. Pleasure boats are kept on the river and for ferrying purposes, so that the names may be of local or comparatively recent application.

It is not necessary to rely on the miraculous portions of the account of the saint's visit; as already mentioned, the river Roe is navigable for small boats up to the Mullagh, and ordinary tides reach for nearly half the distance. If in addition to a high tide the river had slightly increased in volume in its upper part, and as the fall is slight and the land through which it flows are flat, the voyage could have been made without the aid of a miracle. The point to note is that the circumstances must have created an impression at the time which later on culminated in the event being ascribed to a miracle.

There is no doubt there is a substratum of fact in the story of the dangers attending the voyage of St. Columba, who was accompanied by Aidan, king of the Albanian Scots, and his followers, and a sense of thankfulness on the part of some of their safe deliverance may have prompted the gift of the votive offering to some of the churches which either at first hand or eventually became attached to Brougher. The result of the convention, owing to the eloquence and influence of the saint, afforded the liveliest satisfaction to both the bards of Ireland and the king of Dalriada, the newly formed kingdom in Scotland, and they would naturally desire to show their gratitude by an offering to some of the churches in the neighbourhood and they could not have chosen a more appropriate device than the "boat of gold" found at the neighbouring church of Brougher.

At Drumceat for many centuries after the convention it was the practice to hold a public procession of the Blessed Sacrament on the festival of All Saints, to commemorate the important events which took place there at the time of St. Columba's visit.

The boat in its symbolic aspect and in its ceremonial use is peculiarly interesting as an adjunct to churches of early date. That portion of the church known as the nave is so called as representing the ark or ship of the church, and is derived from the Latin word "navis." The vessel for holding incense made of precious metal was called originally navicula (French navette), and was afterwards known as the incense-boat. It was commonly borne by an acolyte, attending the thurifer. The practice of reserving the Blessed Sacrament, which is of very ancient date, led to the necessity of providing a suitable receptacle for it. It is alluded to by the early writers, and the Council of Constantinople under Mennas laid down rules on the subject, and reference is made to the gold and silver receptacles which were suspended over the altar ("Constitution of Menna," Act v. tom. v. p. 159).

When the monstrance came into use, the receptacle in which the Blessed Sacrament was deposited was still formed in the shape of a boat, somewhat like a lunette. A suggestion has been made that the bowl was used as a lamp; when bowls or mortars were used for lights they had a pricket in the bottom to hold the taper. The bowl is more likely to have been used as a sacred vessel, and the provision for suspending it rather shows this to be the case. It would be interesting to follow the evolution of these vessels, commencing with the round bottomed bowl, which could not stand alone; next we have the mazer pattern, later with a stem and foot; and in our earliest chalices we find simply a wide, broad bowl, with stem knob and foot. Of this class are the chalices found in the grave of Bishop Longespee at Salisbury, thirteenth century, and the chalice from the grave of Archbishop Hubert Walter of Canterbury, of late twelfth-century date, found in his tomb in 1890. The last stage is the tall chalice such as came into use in the sixteenth century. The "dove" or "columba" was suspended before the altar from the roof of the church.

It is more difficult to connect the collar with an ecclesiastical establishment, but there need be no difficulty in bringing its date well into the Christian period, as its ornament, the leading feature of which is the divergent spiral, survived in Ireland up to that time and much later than elsewhere.

In concluding this brief notice of the locality where the gold ornaments were found, I may state that I have been induced to pursue the investigations from Mr. Evans's conclusions in his valuable description of these objects in "Archæologia," before quoted, in which he considers that the treasure was of the nature of an ex-voto offering made by some Irish king or prince saved from shipwreck; and I offer the suggestion that the incidents connected with St. Columba's voyage to Drumceat, accompanied by the Scottish king, Aidan, and their deliverance from shipwreck, may have furnished the motif. Mr. Evans writes:—"The custom of making votive deposits was very widespread in the Early Iron Age and in the northern countries. Such hoards were often buried on the borders of lakes and pools, or actually beneath the waters. In the present case the deposit was made close to

the seashore, on a rocky part of the coast (?) liable to shipwrecks, and from the votive ship and its furniture there can be little doubt that it was a thankoffering dedicated by some ancient Irish sea-king, who had escaped from the perils of the waves, to a marine divinity." This suggestion is an admirable one as based on the evidence Mr. Evans had before him, but a study of the locality and its ancient history, with a knowledge of the principal events which took place in the vicinity, all tend to bring the date into the historical and Christian period.

### VENTILATION OF THE HOUSES OF PARLIAMENT.

THE select committee appointed in April last to inquire into the ventilation of the Houses of Parliament have presented an interim report, in which they state that they have held ten meetings, and have examined witnesses on the subject of the ventilation of the building and as to the best means of effecting such improvements as might be thought desirable. They have also caused chemical and bacteriological tests to be applied to the atmosphere in the debating chamber and other parts of the House. At the present stage of their inquiry the committee are not prepared with definite recommendations, nor can they yet state the conclusions to be arrived at with reference to the experiments made on the air, beyond saying that the general results so far as the debating chamber itself is concerned are good. It is added that the state of some of the committee-rooms, smoking-rooms, &c., is by no means satisfactory. The committee propose to continue their investigations during the autumn, though they do not expect to be able to report until next session. In the course of the evidence it was pointed out that the construction and fittings of certain of the lavatories were capable of improvement.

### ADELPHI ASSOCIATIONS.

WHATEVER the financial and architectural merits or demerits of the scheme for a new County Hall on the site of Adelphi Terrace may be, it would undeniably involve, says the *Standard*, the demolition of a most interesting corner of historic London. The name itself recalls the partnership of the four Adam brothers, who are also commemorated by the neighbouring streets. The sons of a distinguished Scotch architect, the designer of Hopetoun House and the Royal Infirmary at Edinburgh, they were members of that astute band of North Britons who acquired fortunes and much unpopularity at the beginning of the reign of George III., through the patronage of Lord Bute. Robert's was the master mind, and to him may be attributed the bold idea of raising shapely edifices, built on a continuous plan, upon the low-lying ground occupied by hovels and cowsheds, and known as Dorset Yard. Erected on arches, so as to give access to the Thames, the Adelphi stands upon supports of solid workmanship, which are well worth inspection. Undeclared by difficulties of site, the Adam brothers had also to contend against the vigorous hostility of the City. The protection of the Court brought upon them the attacks of the Corporation. They were compelled, accordingly, to have recourse to a special Act of Parliament, sanctioning their encroachments on the river, since that powerful body claimed rights over the soil and the bed of the Thames. Local interests had also to be conciliated, and the story goes that the great Mr. Coutts insisted that Robert Street should lie at such an angle as to preserve the view of the Surrey hills from the back windows of his counting-house. A survey of the ground reveals no distortion of plan, however, and it may be that the brothers merely pretended to humour the susceptibilities of their important neighbour. To yet another obstacle—a want of funds—they had to succumb, but not before their undertaking stood assured. The Adelphi was begun in 1768, and not many years afterwards—in 1773—they are found applying to Parliament once more for leave to dispose of the property by lottery—a common expedient in those days with speculative architects. Still, they had made their reputation, and on Robert Adam, in particular, prosperity smiled thenceforth without a break. Fine examples of his abilities are to be seen in many parts of London—for example, in Fitzroy Square, where he resorted to his favourite device of combining several houses into the semblance of an impressive whole. In his screen to the Admiralty, again, he succeeded with consummate skill in giving relief to the eye from Ripley's unworthy portico.

Horace Walpole sneered at Adelphi Terrace; it was to him a collection of "warehouses, laced down the seams like a soldier's frill on a regimental old coat." Its primness would, no doubt, affront the florid taste which found satisfaction in Strawberry Hill. The Adam brothers effected, nevertheless, a notable advance in domestic architecture, especially in their interiors. Many of the houses on the terrace—that occupied, for instance, by the Savage Club—bear witness to their sense of space and of apt decoration kept in strict subordination to

the general idea. To help them in the latter respect, they brought over Antonio Zucchi to England. It was a happy combination, since the Italian, without being an original genius, fully appreciated the possibilities of Classical treatment. The Adamsons, not content with building, were also designers of furniture. Their chairs and sideboards fetch high prices when they come into the market. The literary and artistic associations that would be destroyed by the disappearance of Adelphi Terrace are many and precious. Among its first tenants were Garrick, then at the height of his renown, and another associate of Dr. Johnson's, that great gentleman, Topham Beauclerk. The actor lived at what is now No. 5, and Boswell records how the doctor, returning one day from a dinner with his widow, stopped for a while by the rails of the Adelphi, looking on the Thames. The pair called to memory the loss of the two friends who had once dwelt in the buildings behind them. "Aye, sir," said Johnson tenderly, "and such friends as cannot be supplied." The Adelphi seems, in fact, to have been the home of more or less affluent Bohemianism during the greater part of its history. Rowlandson, the caricaturist, drew his last breath at his lodgings in No. 2 James Street. Lord Beaconsfield, as befitted the son of a literary father, believed himself to have been born in the Adelphi. He was wrong, since industrious research has bestowed that honour, with a clearer title, on a house in King's Road, or, as it now is, Theobald's Road. The mistake, however, was natural enough, for Isaac D'Israeli lived at No. 2 James Street as a bachelor, and stayed at Osborne's Hotel, in John Street, after his marriage with Miss Basevi. Later on the same house was much frequented by Charles Dickens. If their records were accessible, the hotels in this neighbourhood could produce, no doubt, a most varied list of literary visitors. But it is only from such casual allusions as occur in a letter from Gibbon to Lord Sheffield that the Adelphi Hotel is distinguished as having received the historian when he arrived from Lausanne with the manuscript of the last part of the "Decline and Fall." The humbler tap-rooms used, within present memories, to shelter a much more indigent class of hack-writers who starved in garrets off the Strand, and met at night to drown the bitterness of their adversity. Thus it was with the Adelphi, until with the growth of suburban London the whole character of the place underwent a change. It ceased to be residential, and became full of learned bodies and philanthropic causes, influenced, perhaps, by the example of the Society of Arts, which has inhabited John Street since 1774, after the Adam brothers had taken two years to build the house. In the theatre Dr. Goldsmith attempted to make a speech and failed, as might have been expected, whereas Dr. Johnson discoursed sonorously, and to the admiration of his audience, upon mechanics, of all subjects. But it would be inexpedient to attempt here a record of the Society of Arts, or, for that matter, of the less known corporations which have established themselves in the vicinity.

A house-to-house visitation reminds one how naturally institutions for the succour of the more indigent members of the dramatic profession have established themselves near the home of Garrick. In Adam Street are to be found the offices of the Actors' Benevolent Fund and of the Dramatic and Musical Sick and Benevolent Fund. Religion, largely evangelical, has also recognised the quiet corner by the Terrace as a suitable place for taking stock of its numerous efforts. In addition to the Evangelical Alliance, the Biblewomen and Nurses' Association and the Zenana Bible and Medical Mission have rooms there in close proximity to the Railway Mission. More secular interests begin to prevail as the Terrace is traversed westwards. The Institution of Naval Architects was founded in 1860, and thus its transactions follow the growth of the ironclad from the earlier types to such intricate monsters of the deep as will be seen at the great Naval Review on Saturday. Hard by, the Royal Literary Fund, started in 1790, does its best to remove the natural reproach of indifference to the calamities of authorship. The Royal Statistical Society is old enough to have celebrated its jubilee in 1885, though the kindred body at Manchester is a year its senior. It can boast a distinguished list of presidents, and its figures have materially helped legislation in attacking "condition of the people" problems. Lord Goschen's name is connected with its neighbour, the British Economic Association. The Incorporated Society of Medical Officers of Health dates from 1856—a date almost as significant as that of the foundation of the Statistical Society, because sanitary questions began to press themselves on Parliament with increasing vigour, until Mr. Disraeli summed them up with "Sanitas sanitatum, omnia sanitas."

In Robert Street philanthropy comes to the front again with the offices of the Soldiers' Daughters' Home, established during the Crimean war. In James Street is the Royal National Lifeboat Institution, of nearly eighty years' standing, and the Amateur Athletic Association, which has done so much to purge running and jumping of professional "pot-hunters." Thus the Adelphi will be seen, from a list which makes no

pretence of exhaustiveness, to contain a number of excellent bodies—some of quite long standing—which ought not to be made homeless by compulsory purchase except in the last necessity. Still the predominant tradition of this restful retreat from the roar of the Strand is that of letters and the arts—a tradition worthily carried on by the Savage Club. Great men have ceased to live out their private lives in its lofty apartments, but great memories remain, and they should not be lightly disturbed by the pickaxe of the house-wrecker.

### "KILLING" CEMENT.

A LETTER was published last week from Sir E. Durning-Lawrence, in which after recommending the use of Portland cement for dangerous structures like the Campanile, he said it should be "killed." The chairman of the Associated Portland Cement Manufacturers writes to the *Times* as follows:—

In saying that Portland cement should be "killed," he advocates what he would be the first to condemn. This term is used to express the action of over-watering cement in gauging it. The effect of mixing with the cement powder more water than it can assimilate for the purpose of crystallisation is to interrupt and even to counteract the setting process, and thus to prevent the attainment of eventual hardness.

Manufacturers look upon this as a danger to be guarded against in the testing of cement. Material of the finest quality may be made to appear worthless if the making of briquettes or pats is in the hands of an ignorant, inexperienced or careless tester. The precaution your correspondent rightly urges, and correctly describes, is called "aeration," and this is doubtless the word he intended to use.

### TESSERÆ.

#### Paintings and Sketches.

THE great purpose of art consists in the painter imparting to his copy the character of the original scene, and to the full attainment of that object extreme finish of details, so far from being essential, is in every respect most pernicious, inasmuch as such a practice diverts the mind of the observer from its natural inquiries to merely wonder at the patience of the artist. Beyond a certain point, the more the hand labours the more the thought of the mind is weakened, and the highest power the painter can attain, and which will ever be in proportion to his experience, is the knowledge when to leave off, and in this quality Velasquez is unrivalled. It has often been remarked that the first sketch of a picture gives more pleasure than the finished work. One reason, however, why a sketch often pleases more than the finished picture is that in the former much is left to the imagination of the spectators, and as each can fill up the seeming void according to his own fancy, all are likely to be more satisfied with this incompleteness than when the artist has fully carried out his own conception. Another reason is the sketch appeals to our feeling, which is more easily satisfied than our judgment, on which the picture depends for its appreciation. But there is a more powerful reason yet, which is, that in the first sketch the hand follows the mind, whereas in all subsequent work, more or less, it follows the eye; and this is shown in the fact that the highest finish is a source of pleasure to the sight, without producing any lasting impression on the mind. The first painting is a record of the will, whilst the mere finish is but the record of skill.

#### Lighting of Portraiture.

The reason why the human face appears to advantage only when light is thrown upon it more or less from above, and why its likeness can be correct only under such a light, is one very deeply rooted. The nature of man, his erect bearing, the direction of his look, everything that in his appearance distinguishes him from the animal bent to the earth, necessitates that conformation of the forehead, the nose, the mouth, &c., which is characteristic of the human face, and which was required by reason of the sunlight coming to him chiefly from above. And therefore, also, it is only the light coming more or less from above that shows the forms of his features in a characteristic way. Thus it is no exorbitant demand that sculpture ought to be seen in the same light in which the original appears to the best advantage, and which every painter is free to choose for himself and fix in his picture. In the plastic reproduction of the body the coarser and more general forms may be seen with tolerable distinctness even when a false light falls upon them, as the stereoscopic view aids the spectator. In the case of the more subtle features of the face, however, the stereoscopic impression plays but a subordinate part, on account of the slight difference of depth of the characteristic features. The true impression of the face in a bust therefore depends almost exclusively upon the play of light and shade which gives to the one-coloured material the

intended aspect. And this light and shade will be judiciously disposed only if the portrait is looked at as nearly as possible from the direction and in the light in which the artist intended it to be seen.

#### Roman Basilicas.

The basilica proper is an oblong building divided into three or more naves, the central being the most important, by colonnades, with a raised tribune, a sort of semicircular alcove called the absis or apse. This apse is separated from the nave by a wide transept running across the whole building, and generally extending beyond its limits of width, and spanning the central nave by a vast arch called "triumphal." The apse exactly corresponds to this great arch, and sometimes chapel have grown in the back wall of the transept, corresponding in like manner to the arches opening into the side naves, so as to end the vista of all the colonnades with these recesses and altars. In the earliest churches, however, altars were less abundant than now, and the central apse was the only one existing. Sometimes the side naves were double on each side (as in San Pietro), forming five with the central nave. Still the basilican oblong form remains in them all. The galleries, however, are not found in the earliest basilican churches. Coin remain which afford a rude representation of the great Ulpia basilica of Trajan, and from this one would gather that the galleries extended all along above the colonnades from end to end in that building. If so, the earlier churches built after these models omitted that feature, and raised the walls of the central nave on arches or colonnades with flat architraves under which access was given to the side naves. These naves, with the transept, apse and raised tribune, under which was subterranean chapel or "confession," in which the tombs of the saints were deposited, tombs which fixed the site of the church formed the leading structural features of the basilica proper.

### GENERAL.

**The King** and members of the Royal Family proposed to place in Whippingham Church a permanent memorial to Her late Majesty. This will probably take the form of an altar and rearedos.

**Taco Mesdag**, the landscape painter, and brother to Hendrik Willem Mesdag, died last week. He was born in 1829 at Groningen, and was the son of a banker. For many years he was engaged in his father's business, but during that time he already devoted himself to painting. In later life he confined himself to painting.

**The Excavations** at the Hill of Tara, in order to discover the Ark of the Covenant, have been suspended, and it is very doubtful whether they will be resumed.

**Mr. Ryde**, of Westminster, has been appointed by the Horsham Board of Guardians as valuer to survey and value for poor rate assessment purposes the several buildings and other hereditaments comprising Christ's Hospital school and premises in the parishes of Horsham Rural and Itchingfield.

**Mr. A. Y. Nutt**, the designer of the temporary annex to Westminster Abbey, was decorated on Monday with the insignia of a member of the Royal Victorian Order. Mr. Nutt is the clerk of works at Windsor Castle, being in the capacity the representative of Mr. Akers-Douglas, and he is also the architect to the Dean and Chapter of St. George's Chapel.

**The Prix de Rome** in architecture has been awarded to M. Prost. The subject was a national printing-office. The premier second grand prix was obtained by M. Chiffot, and the third by M. Coutan.

**The Athens Correspondent** of the *Times* writes:—Excavations carried out by the Greek Archaeological Society in the neighbourhood of Andritzæna have resulted in the discovery of a small temple of Pan, the columns of which are stated to be in good preservation.

**The Emperor Menelik II.** has sent a letter to the trustees of the British Museum acknowledging the receipt of the address and publications transmitted to His Majesty, and giving assurance of help and protection to all English people who may go to Abyssinia in the interest of science.

**M. Charles Girault**, the French architect, having completed his plans, is to undertake the enlargement of the palace of Laeken, originally designed by Montoyer and Payen, for the King of the Belgians.

**The Board of Management** of the Manchester Royal Infirmary have agreed to ask the trustees for power to sell the infirmary buildings and site to the Manchester Corporation for 400,000*l.*

**A Special Commission** has been appointed in Paris in order to investigate the best means of dealing with the smoke nuisance which of late years is troubling the Parisians. A commission relating to the subject will be examined and tested on application to the Prefect of the Seine.

THE

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**BERMONDSEY.**—Sept. 16.—Designs are invited for artisans' dwellings to be erected on land at Rotherhithe, within the borough of Bermondsey, and known as the Fulford Street area. Premiums of 100*l.*, 60*l.* and 40*l.* will be awarded. Mr. Fredk. Yall, town clerk, Town Hall, Spa Road, S.E.

**BIDEFORD.**—Sept. 25.—The Town Council of Bideford are about to erect municipal offices and a public library upon a site opposite the west end of the Long Bridge, Bideford, and they invite designs for the proposed buildings. Premiums of 100*l.*, 15*l.* and 10*l.* respectively are offered for the designs which shall be placed by the Council first, second and third in order of merit. Designs and descriptions, &c., are to be delivered to Mr. Wm. B. Seldon, town clerk, 18 The Quay, Bideford.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for the three selected designs. Mr. Vivian Chard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford S.E.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**MAIDENHEAD.**—Oct. 1.—Designs for free library. Premiums offered of 50*l.*, 20*l.* and 10*l.* respectively. Mr. John Kirk, town clerk, Guildhall, Maidenhead.

**SOUTHEND.**—Sept. 7.—Designs are invited for a church to accommodate 500 persons, a clergy-house, and a parochial hall or parish-room about 50 feet by 30 feet. Mr. C. H. J. Talmage, Kathleen Villa, Southchurch Road, Southend-on-Sea.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

## CONTRACTS OPEN.

**BEXHILL.**—Aug. 20.—For erection of a shelter hall, lavatories, and conveniences in Egerton Park Road, Bexhill, Sussex. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

**BIRKENHEAD.**—Aug. 26.—For erection of offices at the tramways depot, Laird Street. Mr. Chas. Brownridge, borough surveyor, Town Hall, Birkenhead.

**BLACKPOOL.**—For erection of two houses in Palatine Road. Mr. R. Holdens, 211 Palatine Road, Blackpool.

**CHELSEA, S.W.**

Columns, Girders, Roofs, Railings,  
Ornamental Work, Castings, &c.

**STALYBRIDGE.**—For construction of concrete foundations, &c., at the Stalybridge generating station. Mr. Huon A. Matear, architect, The Temple, Dale Street, Liverpool.

**SWINDON.**—Aug. 22.—For erection of higher elementary school, Euclid Street, Swindon. Mr. W. Seaton, town clerk, Town Hall, Swindon.

**SWINDON.**—Aug. 25.—For extensions to the technical school, Victoria Road. Messrs. Bishop & Pritchett, architects, Regent Circus, Swindon.

**THORNTON.**—Aug. 25.—For erection of a police station and cells, &c., at Thornton, Lancs. Mr. Henry Littler, architect, County Offices, Preston.

**WALES.**—For renovating the Rhymney parish church. Particulars may be obtained on application at the General Offices, Rhymney.

**WALES.**—Aug. 18.—For erection of a large hotel, with stables, &c., Jubilee Road, Aberaman. Messrs. Llewellyn Smith & Davies, architects, &c., Aberdare.

**WALES.**—Aug. 18.—For erection of a stone arched bridge, or, in the alternative, of an iron girder bridge, at the Pitt, Llanarth; and for erection of a stone retaining wall to the bridge at Hendre Glyn, Llanover, Abergavenny. Mr. John Gill, surveyor, 4 Brecon Road, Abergavenny.

**WALES.**—Aug. 18.—For construction of basements and foundations and other works for the proposed new lunatic asylum at Whitchurch, near Cardiff. Messrs. Oatley & Skinner, architects, Edinburgh Chambers, Baldwin Street, Bristol.

**WALES.**—Aug. 19.—For erection of a presbytery, Mountain Ash. Mr. T. R. Bates, architect, 26 Westgate Chambers, Newport.

**WALES.**—Aug. 20.—For alterations and additions to Minera police-station, Denbigh. Mr. R. Lloyd Williams, county surveyor, Denbigh.

**WALES.**—Aug. 22.—For erection of an electric-power station and car-sheds, Pontypridd. The Chairman of the Electric Lighting and Tramways Committee, Council Offices, Town Hall, Pontypridd.

**WALES.**—Aug. 25.—For erection of a cottage hospital, &c., at Rhymney, Mon. Messrs. Llewellyn, Smith & Davies, architects, Aberdare.

**WALES.**—Aug. 27.—For erection of a lunatic asylum at Caerleon, Mon. Mr. A. J. Wood, architect, 22 Surrey Street, Victoria Embankment, W.C.

**WALES.**—Sept. 8.—For erection of a cattle and sheep market at Llandovery. Mr. John Thomas, town clerk, Llandovery.

**WALSALL.**—Sept. 8.—For erection of a school to accommodate 1,000 children and a caretaker's house at North Walsall. Mr. H. E. Lavender, architect, Bridge Street, Walsall.

**WESHAM.**—Sept. 30.—For erection of workhouse and offices at Wesham, Lancs. Messrs. Haywood & Harrison, architects, Accrington.

**WITHINGTON.**—For erection of a nurses' home, two pavilions and surgical wards at the infirmary at Withington, Lancs. Mr. James B. Broadbent, architect, 15 Cooper Street, Manchester.

**WOOD GREEN.**—Aug. 19.—For erection of four, eight, fourteen or twenty-two private dwelling-houses on the Westbury estate. Plans and specifications can be seen at 9 Waldegrave Road, Turnpike Lane, Hornsey.

AT a meeting of the Louth Corporation, the electric lighting committee recommended the erection of an electric light and power works, at a cost of 10,000*l.*, on land in the centre of the town belonging to the Corporation.

AT the half-yearly meeting of the Central Board of the National Association of Master Plumbers of Great Britain and Ireland at Huddersfield on the 13th inst., presided over by Mr. W. L. Harrison, of Hull, a report was read of the work of the educational committee in reference to a form of indenture for apprentices, which had been drawn up in conjunction with the Worshipful Company of Plumbers of London. Hitherto there has been great laxity in the trade throughout the country respecting apprentices, and it became necessary in many cases for operative plumbers to be recruited from the country. The form of indenture, providing for a seven years' apprenticeship, unless the lad has been previously pursuing his education to fit him for his trade at a technical school, on terms varying according to localities, was adopted. Luncheon was partaken of at the Liberal Club, and was attended by the mayor (Alderman Ernest Woodhead). At a subsequent stage it was resolved not to recognise the new by-law of the Operative Plumbers' Association providing for extra allowances for out-of-town work. A resolution passed at Leeds on July 10 by representatives of the Confederation of Master Slaters, Painters, Plumbers and Plasterers, not to join the National Builders' Federation, was adopted.

MESSRS GEORGE MILLS & Co, hydraulic engineers and ironfounders, of Globe Iron Works, Radcliffe, Manchester, ask us to mention, apropos of the illustration which we published last week of the new premises at Dalston erected by The Shannon Company, Ltd, that this building is protected throughout from fire by Titan automatic sprinklers, of which they are the sole proprietors and manufacturers.

## BUILDING AND BUILDERS.

THE memorial-stone of the new United Free church at Culter, Aberdeenshire, was laid on the 6th inst.

THE quarterly meeting of the executive of the Scottish Building Trades' Federation was held on the 7th inst. at the Station hotel, Stirling, Mr. Robert Lamb, builder, Edinburgh, president, in the chair. Members were present from various parts of the country. The report, which was submitted by the secretary, Mr. James L. Selkirk, C.A., Glasgow, referred to the principal matters which had been engaging the attention of the executive and the progress that was being made. In particular the question of still more complete organisation in the several districts was fully considered, and an earnest appeal made for hearty co-operation. Progress was reported in regard to various questions which had been under consideration at previous meetings. The visitation of sundry districts was strongly recommended so as to keep the members in touch with the work of the Federation and to deepen their interest in it. The state of the finances called for special attention, and a scheme was submitted for placing these on a more satisfactory

footing. Much importance was attached to the cultivation of closer relations with kindred associations, and specially with the National Federation of Building Trade Employers, which was doing valuable work in organising the various trades, chiefly throughout England. Interesting discussions took place on the various subjects treated in the report, and resolutions adopted bearing on future work. The annual meeting of the Federation was appointed to be held in Edinburgh in October next. A vote of thanks was awarded to the chairman for presiding.

## VARIETIES.

AT a special meeting of the York City Council Mr. R. Percy Dale, an alderman of the city, was elected town clerk and clerk of the peace at a salary of 700l a year, in the place of Mr. W. H. Andrew, who has been appointed to St. Helens.

THE funeral of the late general secretary of the United Operative Plumbers' Association of Great Britain and Ireland (Mr. G. B. Cherry, R.P.) took place on the 11th inst. at the Southern Cemetery, Manchester. There was a large attendance of plumbers from the centres of the United Kingdom as well as from Manchester and the district. Among those present were Mr. J. Beal, R.P., secretary of the National Association of Master Plumbers, Mr. Jaffrey, Mr. Lightfoot, and a number of past presidents and members of the Association, also Mr. W. R. E. Coles, clerk of the Worshipful Company of Plumbers.

THE Bishop of St. Asaph officiated at Shotton-in-Hawarden on the 7th inst. at the consecration of the new St. Ethelwold's Church, the erection of which has cost about 7,000l. The new church is of a spacious character, built of Staffordshire sandstone, with a clerestory, western gallery and an apse capable of holding 600 persons. There are three sets of windows in the east end, one erected to commemorate the independence of Crete, given by the Byron Society, and the other two are memorials to the late Miss Davison, given by her nephews and nieces. The south aisle is to the memory of the late Mr. Gladstone, chiefly given by Mrs. Wickham. In the gallery are three stained windows, given to the memory of the late Mr. Gladstone by his grandchildren from Lincoln. The gallery is approached by a flight of steps from the porch. The floors of nave, aisles and choir are laid with floor blocks, the chancel with small black and dove-coloured tiles. The step and floor in the sacrum under the altar table is in marble. The

Agents for Liverpool:—

THE WELL FIRE CO., Ltd.

This Independent Range is fitted with hot water circulating boiler as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The above shows the heat concentrated under the boiler and the waste heat passing under the hot plate.

The casing and oven door are lined with slag wool and a third oven can be arranged if required.

pulpit and font are carried out in stone, the former having open arcing and carved paterae, the latter being in Helsby stone, with carved emblem and appropriate inscriptions, and is the gift of local subscribers, the result of the efforts of the children of the parish. The nave and aisles are seated throughout with chairs, the chancel having oak choir fronts and prayer desks. The altar table is of oak. The reredos above is of wood, carved, painted and decorated, and contains subject panels of Our Lord in Majesty and adoring angels. The church is lighted throughout by suspended oil lamps. Although the main edifice has been completed, it still wants a steeple, a boundary wall and an organ before the original plan can be said to be carried out in full detail, and these will be supplied as the funds allow. The work has been carried out by Messrs. J. Ward & Son, of Uttroter, from the design of Messrs. Douglas & Minshall, of Chester.

#### "SOLOMON'S AQUEDUCT."

IN a report to the Foreign Office on the trade of Palestine during 1901 Mr. Consul Dickson has an interesting passage on the water-supply of Jerusalem:—"In the way of public works the most noteworthy undertaking during the year was that for supplying Jerusalem with water, which was brought in iron pipes from a spring situated about seven miles distant south of the city, and known as the "Sealed Fountain" of Solomon's times. "The threatened water famine," says Mr. Dickson, "which was only prevented through the timely assistance of the railway company, caused the municipal authorities to realise the necessity of providing in future for any emergency of this nature, and accordingly a petition was forwarded to Constantinople asking permission to utilise a portion of the revenues of the "Evkaf" (religious endowments) for the purpose of providing Jerusalem with a water-supply. The request was granted, and £6,000 were set aside for carrying out the enterprise. A commission of local officials was formed to supervise the undertaking, and an engineer from the Public Works Department at Constantinople was employed for doing the work. A portion of the old stone aqueduct known as "Solomon's Aqueduct" was to be used where it could easily be repaired, but for the greater part of the distance nearly seven miles of 4-inch iron pipes were required. No notice calling for tenders was issued by the authorities; nevertheless, a British firm was communicated with on the subject, who offered to supply the

pipes in question at 4 f 25 c. (3s. 5d.) the metre, c.i.f. Jaffa. But the offer arrived too late, a local German merchant having already obtained the order, and signed the contract with the municipal authorities for furnishing the requisite number of pipes from Antwerp in Belgium at 4 f. 90 c (3s. 11d.) the metre, c.i.f. Jaffa. The work was carried out with energy and expedition, although the pipes were hastily laid, and was completed by November 27, the anniversary of the Sultan's birthday, when the inauguration ceremony took place. Two public fountains have been erected, one within the city, in the enclosure of the Great Mosque, and another outside the walls for the use of the inhabitants. The supply of water is, however, far from adequate for the requirements of a city of the size of Jerusalem, but is a boon to the poorer classes, and in times of scarcity of rain will help to avert a water famine, such as Jerusalem was threatened with last year.

#### BRIDGING SYDNEY HARBOUR.

PREVIOUS to 1857 communication between the two Sydney shores was conducted by means of ferry and row boats, but in that year a wooden bridge, constructed by private enterprise, at a cost of 75,000£, was opened, a toll being levied on each passenger, vehicle or animal crossing. In 1884 the bridge was purchased for the sum of 40,000£ by the State Government, and the tolls abolished. This was followed by such a rapid expansion of passenger and vehicular traffic that a new bridge became indispensable, and after various preliminaries, competitive designs were invited from various parts of the world, that obtaining the first premium being estimated to involve a cost of 295,700£. Ultimately it was arranged that the new bridge should be constructed from designs prepared by Mr. Percy Allan, M Inst C.E., one of the engineers in the State Department of Public Works, and an Australian by birth, a commencement being made with the actual work in September 1899, and the structure formally opened on June 28, 1902, by Sir Harry Rawson, the State Governor, assisted by the Hon. E. W. O'Sullivan, State Minister for Public Works.

The new bridge is one of the largest and most substantial yet constructed in the Commonwealth, and the experience gained during the progress of the work will naturally be utilised in connection with the proposed construction of the

immense bridge across Sydney Harbour. The total length of the Pyrmont Bridge and its approaches is 1,758 feet, the bridging occupying 1,200 feet, of which 223 feet represent the length of the swing span. The area of the latter, 12,000 superficial feet, compares favourably with the 10,600 feet of the Newcastle-on-Tyne bridge swing, the 9,400 feet of the swing bridge in connection with the Manchester Ship Canal, and the 8,700 feet of the bridge swing at Hawarden. There may be larger bridge swings in the United States, but none constructed in a manner more up to date than at Pyrmont.

The heaviest work was in connection with the sinking of the caisson forming the main support of the bridge swing. This huge chamber, having a diameter of 42 feet, was commenced on August 2, 1900, and a few weeks later was completed sufficiently to permit of its being grounded, by means of girders and wedges, in the position it was intended to permanently occupy. Then it was gradually worked down a depth of 46 feet below low-water mark, at which point the cutting edge touched rock on one side. The necessary damming having been completed, the water was pumped out and excavations carried on in the "dry" until a "blow" occurred, when the work had to be continued with the surface of the rock under water. The caisson, when the work of sinking had been completed, was filled with a solid mass of stone and concrete, representing a dead weight of over 6,800 tons.

Electricity supplies the motive power for working the bridge swing: its slewing, the lifting of the ends, the operating of the gates closing the traffic, and the lighting of the roadway being controlled by a man stationed in the conning tower on the centre of the bridge. So perfect are the arrangements that by simply pressing a button the bridge—weighing 800 tons—can be opened or closed in forty-four seconds. Both the slewing and lift motors are carried on a platform inside the drum, the former working through a train of gears a vertical shaft, on the lower end of which is a cast-steel rack secured to the top of a pivot pier, while the end lift is effected by means of cones on horizontal shafts worked by a 35 horse-power motor gearing on to a longitudinal shaft running the whole length of the bridge span. The materials used in the latter were iron and stone, Australian hardwood being largely employed in the construction of the other spans, twelve in number, each having a length of 82 feet; while the roadway, which is 4 feet wider than that of the Tower Bridge, London, is asphalted.

## FORESTRY IN SAND-HILLS.

To make a desert productive by growing forests where probably no trees ever grew before, to modify climate and protect field crops by checking the hot winds which wither and destroy, to place within convenient reach of a rich agricultural country a cheap and permanent source of timber supply—these, says a writer in the *New York Times*, are the results which the Bureau of Forestry confidently expects to secure by the work it has just begun in the sand-hill country of Nebraska. The President recently put his approval on the scheme by declaring 211,000 acres of the public lands of Nebraska forest reserves. Two reserves were created—one, called the Dismal River reserve, between the Dismal and Middle Loup Rivers, with 86,000 acres; the other, the Niobrara reserve, with 125,000 acres, between the Niobrara and Snake Rivers. The division of tree-planting of the Bureau of Forestry has now its experts in the field selecting suitable places for forest nurseries and plantations. In a few years thousands of acres of trees will have been set out, and forests created by artificial methods will have begun their struggle for life in one of the great deserts of the Middle West.

The Nebraska work marks an advance in forest policy in America, and a very important one. Hitherto the Government has been content to acquire and administer lands which were already wooded. But in undertaking the Nebraska work the bureau has declared its policy of growing forests as well as administering those which already exist; it has undertaken the task of creating sources of timber supply on land that cannot profitably grow field crops. If the undertaking succeeds, or even if it shows in the next few years the proof of its ultimate success, its result is sure to be manifested in the creation of more reserves in the prairie lands of the Middle West and the planting of forests on a far larger scale. The sand-hill country occupies about a third of Nebraska, and lies in the centre of the State. Geologists believe the country was once the bed of an inland sea whose sandstone deposits, under the wearing influence of the prevailing north-west winds, have crumbled into sand and been heaped up in drifts and mounds. The sand-hills have been piled at right angles to the wind, that is from south-west to north-east, and this is the course taken by the rivers which flow through the country. It is the general belief that a great underground flow of water passes through the sand-hills and drains the

entire area. It has often been observed that no matter how dry the season may have been or how long the hot winds may have been blowing, the sand only a few inches beneath the surface is always moist.

Trees with roots long enough to penetrate into the damp rich soil find abundant nourishment, and thrive accordingly. The bull pine has a long tap root, which goes down straight as a plumb to the wet sand beneath. However scanty the rainfall, this tree is secure from drought by reason of its store of moisture under ground. The Bureau of Forestry has planned to plant up the sand-hill reserves gradually with trees by making small plantations of 4 or 5 acres in the most favourable parts of the country, and gradually extending them until they ultimately merge together in a continuous forest. Thus widespread mistakes will be avoided, and the conduct of one plantation will affect the treatment of the rest. The forest planting in the sand-hill country is watched with friendly interest by the people of Nebraska, who feel confident of its success, now that the Government is behind it. The work means much to them, for if it succeeds on the limited area included in the forest reserves, it should succeed anywhere in the fifteen millions of acres of unproductive land in the entire sand-hill country and thus increase tremendously the value of a third of the State's area.

### THE PASSING OF NEWGATE.

PREPARATIONS for the demolition of the female wing at Newgate Prison have been completed and the work is about to be commenced. The statements (says the *City Press*) which have appeared to the effect that workmen are engaged in pulling down the historic prison itself are without foundation, as nothing can possibly be done in that direction until the new temporary cells have been built. In the meantime, however, changes have taken place in the old prison, as the gallows have been taken down and removed to Pentonville, where, it is anticipated, future executions will take place. It may not be generally known that in the building of Newgate Prison some magnificent Portland stone was used. It is the intention of the Corporation to utilise these great blocks of stone in the building of the new Sessions House, which will be on the site of the present prison-fortress. Strange to say, nearly every block of Portland bears upon it what is known as a quarry mark, that is to say, each gang of prisoners

at the quarries had their own particular mark, and the fact is apparent to an expert observer of the stone. The female wing, which lies at the back of the prison, was completed about the year 1852, and the outer walls are of great strength. The place is built in galleries, and was evidently intended to resist the attacks of time. It has not been used as a prison for a great many years, and has consequently fallen into a somewhat bad state of repair. The doors of the old-fashioned and darksome cells have been taken away, and will be used in connection with the new cells, which are being constructed on a very up-to-date principle. Scarcely any wood is being used in their erection, the framework being composed of steel sections, which are covered with concrete, and finally receive a coating of cement. Nearly 5,000*l.* is being expended on the construction of these new cells, which will be in use for some five or six years. The work is expected to be finished in October.

### ROWTON HOUSE No. 5.

A PARTY of guests was invited to a private view on Wednesday (the 6th inst.) of the latest addition to London's Rowton Houses which, as our readers are aware, are the splendid outcome of Lord Rowton's beneficent scheme for the amelioration of the conditions under which the working classes pass their lives. This new building, which has arisen in Fieldgate Street, Whitechapel, is the fifth which has been erected by Lord Rowton's company, Rowton Houses, Ltd. It is the largest which has so far been built, and provides accommodation for no fewer than 816 lodgers, each of whom has a separate room containing a bedstead with spring mattress, overlay and full complement of bedding, and other necessary furniture, the charge for which is only 6*d.* per night. The elevations of the new building are in pressed Leicester facing brick, relieved with Fletton brick and dressings of pinky buff terra-cotta. The frontage is flanked by towers which, with the accessories of the main entrance, constitute the chief architectural attractions, in so far as external appearances are concerned. For administrative purposes the interior, whose walling is built of Fletton and glazed brick, divides itself into five sections, under the heads of the superintendent's and office clerks' apartments, those of the bed-makers, the catering department (including accommodation for females employed in kitchen, scullery and store shop), the lodgers' day-rooms and their cubicles. The day-rooms are on the ground floor, where

OFFICE: 6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS, LONDON, E.C.

one of the most prominent features off the main corridor leading from the main entrance is the dining-room—a spacious and handsome place, with large windows and ventilating top lights. Seating is here provided at tables for 456 men, besides extra seats and easy chairs, which are also for the benefit of the diners. The floor is laid with wood in the herring-bone fashion, whilst the walls are adorned with a high dado of glazed brickwork, in tints of cream and chocolate. Pictures are hung in frames around, and the general effect is one of sprightly airiness and comfort, which may be said to characterise the day-rooms throughout. This is particularly so in the reading and smoking-rooms, both of which are large and long. In the former are two bookcases in polished oak, containing together between 400 and 500 volumes by standard authors and various modern writers of note on sundry themes. The leading daily newspapers and magazines are likewise to be supplied in the reading-room. A considerable portion of the wall space is devoted to a series of panels emblematic of the seasons, these having been specially painted by Mr. H. F. Strachey, and generously presented to the House by the artist. Each season is represented by the figure of a workman engaged in seasonable avocations, and by larger compositions bearing on the same subject; and in a central position over a fireplace there appears an allegorical sketch, in which sits enthroned a symbolical figure of England, to whom the fruits of the land are being brought by the cultivators. The reading-room is provided with teak seats and tables for 168 lodgers, and the smoking-room, equally well furnished for its purpose, affords accommodation for 140. In addition to a long corridor elsewhere, provided with garden chairs, there is on the flat, extensive roof of the dining-room an open-air lounge with similar furniture, and with big pots of plants and flowers. Amongst other requisites, not to say luxuries, in this workmen's hotel are dressing-rooms where the men may change their garments during hours when the cubicles or bedrooms are not accessible; bathrooms with ivory-glazed fire-clay baths; feet-washing troughs supplied, like the baths, with hot and cold water; wash-houses, with troughs where the lodgers may wash their own clothes; a room where they may dry their clothes on a wet day and one where they may clean their clothes and boots; two rooms for tailoring and shoe-making, a barber's shop, with hot and cold water and the usual fittings. One of the most important essentials is the catering department. The kitchen is fitted up with ranges, gas and steam-cooking apparatus, dressers, cup-

boards and cook's store; the scullery, with large teak sinks and draining boards, plate-racks and other requirements, and the larder is also equipped in the most approved style of the period. The arrangements as to food have been very carefully devised for the benefit of the guests, who may bring their own meat or get it at the lowest possible price from the stores, and may cook it themselves or get it cooked for them at a very trifling cost. The catering department, as the secretary (Mr. Dulake) points out, is not in itself a paying concern, and an idea of the prices generally may be gathered from the fact that the charge for a cubicle, with the use of day-rooms, lavatories and other conveniences is only 6d. per night. The lodgers' cubicles, which occupy a big building of five floors at the back or eastern side of the establishment, are arranged along corridors with dividing spaces, planned with the objects of affording the best possible ventilation, reducing the risks of fire to a minimum and obtaining isolation in case of any appearance of infectious disease. There is an extensive system of lockers where the lodgers may keep clothes, even umbrellas and other articles, each of the 816 having a key differing from all the rest. The floors of the house generally are fireproof. The sanitary arrangements appear to be especially satisfactory. The lighting throughout is electric.

### CONTRACTOR OR WORKMAN?

At the Cardiff County Court last week Judge Owen heard an application for arbitration under the Workmen's Compensation Act by John Chapman against John Williams & Son, of the Globe Foundry, the Moors, Cardiff. The facts, which were admitted, were that the applicant, who had formerly been in business on his own account, and was subsequently manager of the Globe Foundry, was engaged in April last to make some brackets for the Minehead Pier. Whilst engaged on the work one of the brackets fell upon him, crushing some of his toes, and one toe was amputated. The point in dispute was whether the applicant was engaged by the day or as a contractor. On some occasions it appeared that he took work on contract for the respondents, but on other occasions he was paid by the day at the rate of 10s. per day. Applicant had two sons working with him, and one account was presented, in the instance under consideration, and was paid by the respondents to the applicant, the account showing that the applicant was paid at the rate of 10s. per day and the sons at 8s. each per day. His

### SANITATION IN MIDDLESBROUGH.

A PAPER describing the sanitary progress of Middlesbrough during the last quarter of a century was read by Mr G. H. Anderson, the chief sanitary inspector of the borough, at the Sanitary Inspectors' Congress. He said that when it was remembered that the first house built in the town was erected in April 1830, and that now, only seventy-two years after, their population numbered about 95,000, it would readily be understood that the difficulties encountered by the municipal authority in keeping pace with its extraordinary growth had been as numerous as they had been intricate. The subsoil of Middlesbrough was principally clay, but a portion in the Marsh district was of a peaty nature. Thousands of workmen's cottages had been erected in this district, and the weight of the buildings had been so great that the ground had settled down to a depth of about 18 inches below high-water mark. Hence, in times of high tides and heavy rainfall, the streets and houses in a portion of the district were liable to floods. The main sewers were constructed in 1871, at a cost of 88,000*l.*, but owing to the low level of the surface on which the town was built, the sewers were tide-locked twice in every twenty-four hours. A pumping station near the outfall was being constructed, and when it was completed they would be able to pump about 2,000,000 gallons per hour, and provision was made for duplicating the plant. When the waterworks extensions were complete the boroughs of Middlesbrough, Stockton and Thornaby would have an unlimited pure supply for at least the next twenty years. Describing the household sanitary arrangements, he stated that there were 4,000 midden privies—relics of the bad bygone years—but there had been no new ones added during the past twenty years. After describing the measures taken to stamp out the great small-pox outbreak of 1897-98, Mr. Anderson spoke of the slaughter-houses of the town, and lamented that butchers preferred to use small, inconvenient, private slaughter-houses rather than kill in the public abattoir.

Sir James Crichton Browne thought the death-rate of the town, although it was falling, and although considering the high birth-rate it should not unfavourably compare with other

large towns, was yet higher than it ought to be. Middlesbrough still had too much enteric fever, diphtheria, measles, far too much infantile diarrhoea and far too much pneumonia. In spite of all this, however, immense improvement was going on.

### CRYSTAL PALACE SCHOOL OF ENGINEERING.

DR. T. KIRK ROSE, assistant surveyor to the Royal Mint, presided over the annual presentation of certificates to successful students of the Crystal Palace Company's school of practical engineering.

Mr. Maurice Wilson, the vice-principal, having read the examiners' reports, which were very satisfactory, the Chairman briefly addressed the students. He said it had given him great pleasure to come down to that famous school, of which he had heard so much, and he had been very much impressed on going round the workshops by the supreme excellence of all the arrangements of the whole Institution. The great feature of the school was the close combination between theory and practice which was so necessary in engineering. It was, of course, absolutely indispensable that any theoretical knowledge should be able to be applied in practice. He reminded them that just at present students of all professions in England ought to be working very hard, as so much depended on what they did in these times of competition. If we had to get all our engineers recruited from the ranks of foreign schools we should be in a very bad way indeed. He thought that Englishmen were quite equal to any foreign competitors in the matter of civil and mechanical engineering. He then distributed the certificates, and in accordance with the recommendation of the examiners presented a medal of the School of Art, Science and Literature to Mr. L. Roberts who, in his course through the school of practical engineering, had obtained the necessary eight certificates, none of which were below third in order of merit.

Mr. Henry Gillman, manager of the Crystal Palace, proposed a vote of thanks to the examiners on behalf of the directors of the company, who, he said, would be extremely gratified to know that the work had been so good and so practical during the term.

In the course of a few remarks, Mr. J. W. Wilson, the principal, said he was sure that the school was beginning to leave its mark on the engineering profession.

A vote of thanks to the chairman concluded the proceedings.

See our Exhibit at the Royal Agricultural Hall, August 12 to 22, Stand 56.

Telegrams, "Union St. Helens." Nat. Tel. 48.

ESTABLISHED 1837.

Interior Lighted by ordinary Plate Glass.

Makers of Ground, Smoothed, Polished, Silvered, Bevelled, Brilliant Cut, and Beat Plate Glass; Rough Rolled and Rough Cast Plate Glass; also of Rough and Polished Prismatic Glass, &c., &c.

SPECIALITE:

### "REFRAX"

(Protected under Patent Acts).

Extracts from Testimonials received

"The 'Refrax' Glass is a GREAT IMPROVEMENT."

"Gives EVERY SATISFACTION."

"The Glass I am perfectly satisfied with; GREAT SUCCESS."

"Compared with Polished Plate Glass 'Refrax' gives TWICE AS MUCH LIGHT for EQUAL COST."

Sold by all Dealers.

Same Interior lighted by "Refrax" Glass.

# INSTITUTION OF MECHANICAL ENGINEERS.

A MEETING of the Institution of Mechanical Engineers has been held at Newcastle-on-Tyne, under the presidency of Mr. W. H. Maw.

One of the papers read was by Mr. W. D. Hunter, on the "Power Stations of the Newcastle and District Lighting Company." He said that the company was formed in January 1889 for the purpose of supplying the city of Newcastle-upon-Tyne and the adjoining districts with electrical energy. The nominal capital was 50,000, and the first issue of shares was limited to 15,000. Considerable delay was experienced in obtaining the necessary powers from the Board of Trade. The interval was, however, utilised for acquiring a station, and purchasing and erecting the requisite plant and machinery. A convenient and centrally-situated station near to the river Tyne was acquired, by purchasing a portion of the Forth Banks Works belonging to Messrs. R. & W. Hawthorn Leslie & Co., which originally formed their marine-engine department, previous to the establishment of the large works at St. Peter's. The station was equipped with three Lancashire boilers, 30 feet by 7 feet 6 inches, and four Parsons's single-phase turbo-electric alternating generators of 75 kilowatts capacity each. The total capacity of the Forth Banks Works at present is 3,000 kilowatts. This includes two 400 kilowatts continuous-current turbo-electric generators which were erected about two years ago, to meet the immediate demand for electrical energy for power purposes. This demand continues to grow, and in order to keep pace with it the Newcastle and District Electric Lighting Co. are now erecting at their new works in the Close two continuous-current turbo-electric generators of 1,000 kilowatts capacity each. The Forth Banks Works are peculiarly situated on the side of a hill, the engine and boiler-rooms forming terraces one above the other. Advantage of such a site could not have been taken without great expense had it been necessary to provide substantial engine foundations, but with the Parsons's turbine these can practically be dispensed with. The total area of the engine-room is only 400 square yards, and in that space, as stated above, there are fixed turbo generators representing a total capacity of 3,000 kilowatts. Water is drawn for condensers from the river Tyne. The site of the new works, at present being constructed and equipped, is immediately on the side of the river Tyne, situated about midway between the High Level and Redheugh bridges. The works when completed

will have a capacity of 12,000 kilowatts, or about 20,000 indicated horse-power. The engine and boiler-rooms, with coal-store overhead, run parallel with the river from which the circulating water for condensers will be drawn. Coal will be brought to the works in barges and conveyed to the coal-bunkers and furnaces by special plant. The workshops, stores, &c., will be situated at the east end of engine-room, where provision is left for building these on. The two turbo-electric generators are each of 1,000 kilowatts capacity, the electromotive force being 500 volts and the speed about 1,800 revolutions per minute. The steam-turbine portion of the generator is of the makers' latest improved construction, and is arranged for the full expansion of steam from the boiler pressure to that corresponding to within 1 inch of the barometer. The expansion is carried out in three barrels or cylinders of definite length and diameter to suit. The dynamos are of the latest type, and embody all the improvements which experience alone can show to be desirable. The five boilers at present erected were made by the Stirling Boiler Company. Each of these boilers is capable of evaporating 18,000 lbs of water per hour at 250 lbs. pressure per square inch. The boilers are fired with chain gate stokers, which work with absolute smokelessness in this type of boiler.

Mr. W. B. Woodhouse, of Wallsend, described the electric-supply power station at Wallsend of the Newcastle-upon-Tyne Electric Supply Company. He said:—The Newcastle-upon-Tyne Electric Supply Company has the distinction of being the first to supply electric power in bulk in this country. The Walker and Wallsend Union Gas Company obtained an Act of Parliament in 1899, authorising supply in Wallsend and Willington, a district of great manufacturing importance, extending along the riverside. The Supply Company having in view the construction of a new power-station, entered into an agreement with the Gas Company, whereby the latter took power in bulk from the Supply Company and distributed to its own customers. That portion of Newcastle originally supplied from the Pandon Dene station, the Walker urban district and Gosforth, are included in the area in which the Supply Company is authorised to distribute power. The whole scheme has been developed and carried out by Mr. Charles H. Merz, consulting engineer to both companies. The station started to supply power to local works in November 1900. Three-phase currents, at a pressure of 5,500 volts and a frequency of 40 cycles per second, are transmitted to the various sub-stations, in which, by

## TAYLOR'S PATENT JUNCTION "

No. 12662.

For WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &c.

APPROVED BY ALL SANITARY AUTHORITIES.

This Junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the many angles required for the various makes, also to avoid the necessity of having joints inside the walls, which are dangerous and not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction can be adapted to any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this Junction, as it only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required. The Perfect Gas and Watertight Joint can be made in a few minutes by any ordinary Plumber. In fixing this Joint, what is necessary is to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back the Lead Pipe 2 inch all round, coat the face of Flange with a little Red Lead Putty, bring the two Faces together and draw up with the Bolts, screwing up each Bolt a little at a time until they are all tight, then the Joint is made and will stand any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all that is required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left in position. With all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Property and causing other inconvenience.

A—Is the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut to any required angle.  
B—Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.  
C—Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in. x 1½ in. Invert Junction for Anti-siphon Pipes, &c.  
D—Shows how to arrange for a small sized branch.

Made in Three Strengths—Ordinary Rain Water, ½" and ¼" Metal.

PRICES AND PARTICULARS CAN BE HAD AT ALL WHOLESALE MERCHANTS, OR FROM

NEW CATALOGUE FREE ON APPLICATION.

means of synchronous motor generators and stationary transformers, conversion is made to 480 volts direct current for power and lighting on the three-wire system, and to 440 volts alternating three-phase currents for power alone. The boiler-house contains eight Babcock & Wilcox boilers, supplying steam at 200 lbs. per square inch pressure with a superheat of 120 deg. F. The engines for the three-phase generators are all of local make. A brief description follows:—One 1,400-i.h.p. engine by Messrs. the Wallsend Slipway and Engineering Co. This is a three-crank triple-expansion engine with cylinders whose diameters are 17½ inches, 28½ inches and 48 inches, the stroke of each being 36 inches, running at 100 revolutions per minute. There are three 1,400-i.h.p. triple-expansion four-crank engines, made by Messrs. Wigham, Richardson & Co. All these engines are direct coupled to three-phase generators with stationary armatures and rotating magnets, made by the British Thomson-Houston Co. There is one 1,500 kilowatt turbo alternator by Messrs. C. A. Parsons & Co., running at 1,200 revolutions per minute. The alternator is direct coupled to the turbine, and is mounted on its own bearings; a forced circulation of oil and cooling water passes round each bearing. As a prime mover of electrical machinery the steam turbine approaches the ideal; it runs steadily, is free from vibration and needs little attention; the question of steam consumption has been the difficulty. In a communication made to this Institution last year the steam consumption per kilowatt-hour was given for a number of turbines; the figure steadily improved with the size of the machine. The Neptune Bank turbine bears comparison best with that supplied by Messrs. Parsons to Elberfeld, a machine of 1,000 kilowatts output. The figures of a test made at Neptune Bank are given, from which it will be seen that the Elberfeld results are beaten. With units of 3,000 to 6,000 kilowatts output, such as will be demanded in the near future, the turbine promises to outstrip all competitors.

The members visited the new pier works at the mouth of the river. The Tyne piers were commenced no less than forty-seven years ago, with the dual object of shielding the entrance to the Tyne from the rough sea and of scouring away the bar. They were constructed from designs originally prepared by Messrs. Walker, Burges & Cooper. With regard to the north pier, the straight portion—that is, the shoreward half—was constructed under a contract, the contractor being Mr. Benjamin Lawton. The outer half was carried out by the Tyne Commissioners' own staff, under the late Mr. P. J.

Messent, who had acted as resident engineer in connection with the first contract. The general design of the structure comprehends a mound of rubble stone carrying a superstructure of masonry. The latter consists of two longitudinal walls connected at frequent intervals by cross walls, the cavities or "pockets" thus formed being filled near the shoreward end with quarry débris, and further seaward with mass concrete. The depth of the foundations of the superstructure varies from low-water level at the shoreward end to 27 feet lower at the pier head. This depth of foundations at the pier head is much greater than was originally contemplated, it having been discovered while the work was in progress that wave action took place at much greater depth than had previously been supposed. The whole work stood well until the winter of 1893-94, after which it was found that some of the foreshore blocks had been moved and the foundations of a short length of pier exposed. In spite of every effort being made to effect repairs, in the year 1897 a breach was formed completely through the pier. This has extended until it was now 100 yards in width. Sir John Wolfe Barry K.C.B., and Messrs. Coode, Son & Matthews were asked to advise the Tyne Commissioners as to the wisest course to adopt, and, after careful deliberation, they decided that the remedy was to construct a length of new work under the protection of the breached structure. The new work is to be 1,500 feet in length, and is to join the outer end of the straight portion of the old work, forming with it a breakwater, straight from end to end, and of a length of over half a mile. In the new work the rubble mound is being dispensed with, and the foundations are being taken down to a hard shale, the depth averaging about 20 feet more than that of the original structure. Above the lower water level the section of the new work is identical with that of the old. The new length of pier is being made of Portland cement-concrete blocks banded from side to side of the pier, no mass work being used except above high-water level. The heaviest blocks weigh from 30 to 40 tons, and those exposed to the sea are faced with Aberdeen granite. The material overlying the new foundation is excavated by means of grabs, and as soon as the grab has worked down to the shale a diving bell is used to level the bed for the blocks. The diving bell now in use is 12 feet long by 9 feet wide by 6 feet high, and four men work in it at a time. The pressure which, of course, varies with the depth of water is about 20 lbs. on the square inch above that of the atmosphere, and up to the present there has been no case of sick-

ness due to working under air-pressure. When the bed is prepared, the blocks are set by helmet divers, and great care is taken to get them level and true, as if they formed part of an architectural structure above water. The reason for commencing the work at some distance seaward of the junction was to admit of work being carried on at two faces, and thus extending seaward and shoreward simultaneously. As regarded temporary plant—the property of the contractors—attention was directed to the staging, the large Goliath cranes, the air-compressors for the diving bells, and to the plant designed for driving the staging piles. In the workyard the method of concrete mixing and of conveying the concrete when mixed to the block moulds was also noticed. The works are being carried out by the Tyne Commissioners themselves. The engineers are Sir J. Wolfe Barry, K.C.B., and Messrs. Coode, Son & Matthews, and the resident engineer is Mr. Ivan C. Barling. The contractors are Messrs. Sir John Jackson & Co. It is expected that the works will be completed about three years hence.

### LIGHTING OF PUBLIC STREETS.

THE following notes by Councillor Bruce Murray on the lighting of public streets have been entered on the Corporation minutes:—The darkness of Glasgow, especially in side streets, was the subject of much unfavourable comment by visitors to the city during the Exhibition. As mentioned by Mr. Wilson, manager of the Dawsholm gasworks, in a recent lecture, one of the engineers at the Gas Congress at Glasgow stated that the lighting of Glasgow streets was deplorable, and described the means employed as a "lot of rushlights and flickering bluebottles." In fact, notwithstanding the great advances that have been made in cities in England, and especially those abroad, Glasgow has hitherto been content with a few experiments in some main streets, using, as far as gas is concerned, old and out-of-date lanterns, quite unsuitable for the modern systems of lighting. Lately some improvement has been made in the latter respect, and new and, I believe, efficient lanterns are being manufactured and introduced, but although this is a move in the right direction, the rate of progress is very slow. The watching and lighting committee have always dealt with complaints promptly, so far as their restricted conditions, financially and otherwise, admitted, but have been hampered by the want of a definite policy as regards a system of lighting. This want

of a definite policy is also a cause of embarrassment to both the gas and electricity committee, and has led, I believe, to a certain amount of comparatively useless expenditure of capital. The Electricity Department has laid down mains for street lighting which are not yet utilised, and which, in view of the experience of other towns in incandescent and other systems of lighting, may never be utilised for this purpose, and the Electricity Department have made, or are making, provision for further extension. Money has also been spent in the introduction of incandescent lighting under conditions that, to say the least of it, do not insure the best results. The globe lamps employed generally are quite unsuitable; this form of lamp does not diffuse the light properly, and the method by which each lamp is fitted to the column is injurious to the life of the mantle, owing to the vibration of the pillars caused by wind and heavy traffic. The thickness of the glass in the globular lanterns also lessens the light, while the hole at the bottom exposes the mantle to injury by wind. The reports from other cities which I submit show that any attempt to use incandescent gas otherwise than in the most approved form of specially constructed lantern is doomed to failure. The quality of gas in Glasgow compares favourably with that in other cities, and when properly utilised the pressure is sufficient to produce the best results with incandescent mantles. But at present the natural pressure of the gas is not utilised, but, with a view to economy, is reduced by governors fitted to each lamp, and the quantity of gas used in side streets in ordinary lamps in Glasgow is less, in some cases to the extent of one-half, than the amount of gas that is allowed in other cities. The burners require at least 3 feet of gas per hour for the proper use of the mantles, but are restricted by false economy to, say, 2 feet to 2½ feet. In addition to having lanterns and mantles of the very best quality and design, special care and skilled attention are requisite to obtain the best results, and this important fact has not yet been sufficiently recognised in Glasgow. From private information there appears to be little doubt that Berlin is the best lighted city in Europe, and although there is a certain amount of electric light in use, that city is mainly illuminated by incandescent gas lamps. Paris is also a splendidly lit city, and the Rue de la Paix is admitted to be the best-lighted street in Europe. The illumination of this street is effected by incandescent gas, which, notwithstanding the high price of gas—6s. 9d. per 1,000 cubic feet—I understand works out at much less than the cost of electric light, and I am informed on good authority that the municipi-

---	---	---

pality of Paris has decided not to extend further its system of electric lighting. The lighting of Vienna and most other continental towns is greatly in advance of anything we can pretend to in this country. But for the purpose of comparison we need not go so far afield. Directing our attention, in the first instance, to one of the nearest neighbouring cities of similar size to our own—viz. Liverpool—which I know from personal observation is much better lit than our own city, I find that about five or six years ago the whole question of the lighting of that city was taken in hand by a committee like our own, and after careful inquiry and numerous experiments it was finally decided in 1898 to rearrange the whole system of lighting, and apply incandescent gas to all the streets, the change to be carried out in four years. The conversion, however, was practically effected in three years, with the result that the illuminating power of lamps throughout the city was increased before midnight from 466 million candles to 1,576 million candles, or nearly four times, while after midnight the illuminating power was increased from 324 to 685 million candles, or more than double. It is important to note that, notwithstanding this great increase in illuminating power, the total cost for lighting, which was 40,889*l.* in 1893, amounted in 1901 to 39,587*l.* or a reduction of 1,302*l.* There were special circumstances connected with Liverpool, such as the reduction of 10 per cent. in the charge for gas for street lighting, which the gas company were compelled to give under arbitration, and some other minor matters, but the result clearly shows that the lighting of a city can be greatly increased by means of incandescent gas with practically little or no additional cost. Mr. Murray refers to incandescent lighting in Newcastle, Cardiff, &c., and goes on to say:—I think one of the first duties of the committee should be to inquire most particularly into the relative cost of electricity and incandescent gas. The adoption of electric lighting, from such information as I can obtain, has already added considerably to the cost of lighting the city, and in this connection I would refer to the recent resolution, approved by the Corporation, to fit 228 additional electric lamps. The annual charge for electricity, at 14*l.* for each lamp, amounts to 3,192*l.*, with, I understand, a capital expenditure of 7,200*l.* Taking 6 per cent. to cover interest and depreciation, this adds 430*l.* per annum to the cost, making 3,622*l.* The number of ordinary gas lamps that will be displaced is 589, and the cost of lighting at present only amounts to between 1,200*l.* and 1,300*l.*, so that the watching and lighting committee have recommended an

increased expenditure of about 2,400*l.* on the area covered by these 228 electric lamps. Our inspector of lighting estimates that the value of incandescent against flat flame may be taken as four times greater in favour of incandescent, from which it would appear that, with the same consumption of gas, greatly increased illumination could be obtained, with only the additional cost entailed by the capital expenditure on fitting, upkeep, mantles, &c. What I think is a very liberal estimate for supplying incandescent gas on the most improved system to the same district, including labour, &c., has been given to me by our inspector of lighting, viz. 2,000*l.* This appears a good deal higher than the other figures in statistics before us; but, accepting it as correct, it would show that, allowing for interest on a capital expenditure of 2,000*l.* for new lanterns, &c., the annual charge for incandescent gas would be 2,120*l.*, as against cost of electric light, 3,622*l.*—a difference of 1,500*l.* on this one district alone. At a meeting of the sub-committee on public lighting, held on May 7, it was agreed to recommend that "before recommending any definite system, it be remitted to the inspector of lighting, the gas engineer and the electrical engineer to have two streets in the city fitted up with the most approved systems of incandescent gas and the Nernst electric incandescent light system respectively, and that the Corporation recommend the gas and electricity committees to authorise the officials of those departments to carry out the necessary experiments, and, with a view to this sub-committee making a comparison of the respective systems, they be authorised to visit, if necessary, other towns, for the purpose of inspecting and reporting on the lighting of the public streets thereof."

#### UNIFORMITY IN SPECIFICATIONS FOR CEMENT AND METHODS OF TESTING.\*

THE attainment of a standard specification is greatly desired by all those called upon to use cement in works of construction; indeed, this matter is of such importance to the manufacturer and consumer that both are concentrating their efforts in endeavouring to accomplish this result.

Mr. Lesley has given us much interesting information in regard to the great variations at the present time in specifica-

ions for cement, these variations not only arising from differences of opinion between experts as to what constitutes good material, and from different methods of testing, but also arising in many instances from lack of knowledge or from inexperience. Some of the specifications call for high strength, others for low; some require quick and others slow setting; many require a finely ground product to be slow setting and to be low in sulphuric acid, which is difficult and often impossible to produce; others introduce chemical qualifications which, if not submitted to an expert for approval, often impose very unnecessary restrictions on the manufacturer.

The difficulties under which the manufacturer labours are therefore evident. His material must satisfy all of the specifications of his different contracts, and a single product can scarcely be controlled by subsequent treatment to meet these different requirements; also he is sometimes asked to meet impracticable conditions. The advantages of a uniform specification to a manufacturer would therefore be great. Instead of being obliged to meet irrational and sometimes impossible specifications requiring a great variety of grades of material, he would be required to produce only one, or possibly two, grades, one quick and one slow setting. His work would be greatly simplified, which would not only reduce the probability of producing inferior material, but also tend to reduce the cost of production.

The advantages of uniformity in specifications, moreover, are by no means entirely in favour of the manufacturer. The material supplied under a uniform specification would necessarily result in a production having more uniform properties and qualities. This material would be ground to a certain fineness, have a definite specific gravity, and develop a strength with less range of variation when treated under definite conditions. Thus the consumer could depend upon the quality of his material better than he does now, and would consequently be able to use it more understandingly, by adopting more efficient methods of manipulation and more economical designs. He would also be able to establish the fact when failures in mortar and concrete occur from poor workmanship and improper manipulation of the materials rather than from the inferior quality of the cement, and he would apply such remedies as would secure more durable and permanent structures. The investigation of cement in any one branch of construction would have a definite bearing on all cement construction and could be utilised in every line, whereas now they excite interest only in a general way.

Again, the consumer would not only save money through economies in manipulation and design, but his material would actually cost less, due to the reduction in cost to the manufacturer, resulting from the production of a standard article. The small consumer, also, not having sufficient appliances for accurate testing, would be more sure of the character of his material. Under the present system he is liable to get all the inferior products of the mill and the shipments which have been condemned on more important work, whereas if only a standard grade of material were produced he would be more likely to secure a normal product.

Every one connected with a laboratory for testing cement knows the great influence which details of seemingly minor importance exert upon the results. In the preceding part of this paper it has been assumed that uniformity in specifications is equivalent to uniformity in the material itself, but this evidently would not be the case unless the specifications were based upon a standard method of testing. For instance, one laboratory might obtain a certain value on a seven-day sand test, and another might obtain a much greater value on exactly the same material. Therefore if the uniform specification called for a value intermediate between the two, the first laboratory would require a higher testing cement than the second, even should their requirements be identical. In order for a uniform specification, therefore, to have any practical value, it must be based on a standard method of testing.

The principal reason that tests of cement show such variations in the results obtained by different operators, is that it is one of the few materials that is not tested entirely in the form in which it is manufactured and sold. Bars of iron and steel, bricks and wood, are tested not only in the form in which they are to be used, but also in the form in which they are produced and sold. Cement, on the contrary, is made in one form, tested in a second and used in a third form.

The tests of cement may be divided into two classes:— First, those which can be made with comparative accuracy, and second, those which are only relative owing to the great influence which the personal equation has upon the results.

The first class of tests are those made on the material as it is manufactured and sold, i.e. specific gravity, fineness and chemical analysis. The second class includes those tests which are made on the material after it has been subjected to certain processes and combined with other elements, and hence exists in a different form from that in which it was pro-

duced, *i.e.* time of setting, tensile and compressive strength and soundness.

The first class of tests are capable of standardisation, providing the apparatus and materials used are made and handled with precision. The second class, on the other hand, are subject not only to variations in the material itself, but also to variations in the other elements used with this material and to variations in the processes employed in combining them.

On account of the difficulty of procuring suitable apparatus for making tests and of manipulating it with exactness, variations will be found to some extent to affect all tests.

The determination of specific gravity is probably least subject to variations due to differences in method, where reasonable care is exercised in its manipulation.

The test of fineness, on the other hand, is subject to variations on account of the difficulty of procuring standard sieves and of manipulating them with precision.

Chemical analyses are also subject to similar irregularities. In the tests made on pastes of cement, the inaccuracies of manipulation enter with double force, on account of the introduction of other elements and of the greater influence of the personal equation.

On account of these many possible sources of error, therefore, it is evident that every detail of manipulation and every piece of apparatus used must be prescribed exactly, thus standardising the methods of testing if it is desired to adopt a uniform specification.

This, however, would not be the only advantage gained by the introduction of uniformity in methods. Even if there were no thought of adopting a standard specification, a standard method of testing would still be decidedly beneficial, in that it would place all results obtained on any material, in any place, on exactly the same basis. Under the present system the results of tests in one laboratory are of little practical value to another. If, however, these results all had the same basis they would have a direct bearing on, and be strictly comparable with, the results obtained elsewhere, which would vastly increase our knowledge of the behaviour of the material, and also render unnecessary a great amount of duplication of investigations.

For instance, a laboratory might make an apparently exhaustive series of tests investigating some property of cement. These tests might be repeated by a second laboratory, using different methods and probably obtaining results seemingly contradictory, thus leaving every one confused as

to the indications of the tests, whereas if standard methods had been used the results would be much more likely to have been corroborative.

Standardisation of methods, therefore, would have the great advantage of placing on a common basis all results either of routine work or of experimental investigations.

Another benefit also would be the doing away with the constant source of friction between manufacturer and consumer in regard to the results of tests. The manufacturer's laboratory may use a method giving high results, and the consumer's laboratory may yield lower values; both, however, being accurate as regards their respective method. The manufacturer, not always realising that the consumer's specifications are based on the results of his own laboratory, and not of the manufacturer's, is constantly endeavouring to show that the failure to meet the requirements is due to the consumer's methods. This is a comparatively unimportant matter, but it helps to show the many annoyances that could be obviated by standardisation.

The American Society of Civil Engineers, through the report of its committee in 1885, was among the first to inaugurate a set of rules for the uniform testing of cement. While these rules served their purpose in an excellent manner for a number of years, they fail to entirely meet the requirements of to-day. This has resulted from several causes, among which may be mentioned, first, improved methods of manufacture; second, increase in knowledge of testing and better acquaintance with the properties of cement; third, the demand for greater accuracy and the more rigorous requirements in specifications; fourth, the increasing importance and magnitude of the works of construction in which cement is used as the principal material.

In recognition of these facts, the Society has recently appointed a committee to report methods for the uniform tests of cement. In carrying out these instructions the committee is confronted with the difficulties attending the selection of standard methods by which uniform and comparable results may be obtained. Anyone engaged in the testing of cements must necessarily encounter the same difficulties and must realise that the basis of a standard specification is a system of testing which will give uniformity in results. This fact cannot be too strongly emphasised. It would therefore appear logical that the first efforts should be directed towards securing uniformity in methods of testing, then the formulation of a uniform specification would naturally follow.

## THE WEEK.

THE Portsmouth Town Council on Tuesday decided by a large majority that an eminent engineer should be requested to advise them as to the most economical method of remedying the flooding of Southsea. This sudden resolve is owing to the action of the Local Government Board. The Council applied for authority to borrow £8,200 for the construction of a new high-level relief sewer. But the Board declined to sanction this loan until the Council gave an undertaking that it would submit a proper scheme for dealing with the sewage and storm water from the low lying area at Southsea, and would expeditiously proceed with the work. The inconvenience caused by flooding is said to occur not more than a few times every year; it will be necessary to expend from £80,000 to £100,000 in order to put a stop to the flooding. The Government have a great interest in the various towns which constitute Portsmouth, and although the action of refusing permission to borrow may be judged despotic, it is sensible that in no other way could the Town Council be compelled to deal with the problem. The borough engineer prepared a scheme which could be carried out at a cost of about £25,000, but it has not been approved by the officials who are connected with the town.

THE Joint Select Committee of the Houses of Lords and Commons have recommended clauses in measures for housing of the working classes which will impose additional responsibility on the Home Secretary. The Council or company desiring to acquire land will have to submit a description and plan with other particulars to the Secretary of State. He will determine the number of persons for whom a housing obligation has arisen, and a certificate to that effect will be issued. The buildings will be subject to the provisions of the London Building Act. Inspectors are to be appointed for the purposes of making inquiries that will be necessary, and the expenses incurred, including those of witnesses summoned, and a reasonable sum for the services of the inspector, will have to be borne by the Council or company. In places outside London similar inquiries will be held. There is often doubt about the persons called the labouring class for whom the dwellings are to be erected. It is to include mechanics, artisans, labourers and others working for wages, day-labourers, costermongers, persons not working for wages but engaged at some trade or handicraft without employing others except members of their own family, and persons other than domestic servants whose income does not exceed an average of 30s. a week, and the families of any persons who may be residing with them.

IN 1895 M. CHALLEMEL-LACOUR, the president of the Senate, expressed the desire that a series of eight tapestries might be produced at the Gobelins for the decoration of the Luxembourg Palace. It was stipulated that political subjects were to be avoided. After consideration it was decided that the pieces should be derived from the "Metamorphoses" of OVID. The poet is much admired by French students of literature. But artists have not drawn inspiration from him, for in presenting mythological subjects Greek authors have been preferred. There is on that account some novelty in the selection of the poet to afford subjects for decorative tapestries. The first commission was given to M. ALBERT BESNARD. The legend he chose was DAPHNE pursued by APOLLO and changed into a laurel tree. The work has been satisfactorily executed at the Gobelins. M. MAIGNAN will continue the series, which it is expected will occupy him about four years. He is at present engaged on two tapestries, viz. *Jupiter and Semele* and *Venus and*

City Council of Philadelphia displayed an amount of sacrifice which is unusual among American municipal corporations when they confided the preparation of the con-

ditions of the competition for the monument to the soldiers, sailors and marines who fought in the war for the suppression of the rebellion to the T-Square Club and Philadelphia Chapter of the American Institute of Architects. Although about 700 applications were made for a copy of the conditions, there were no more than sixty-two plans received. The two societies elected Mr. HOWARD WALKER, of Boston, and Mr. J. M. CARRERE, of New York, as representatives, and they in turn appointed Mr. CHARLES GRAFELY, of Philadelphia. The jury testified to the excellence of the designs, and considered that any of the five selected could be executed within the nominated amount of 500,000 dols. The prizes were awarded as follows:—(1) 1,000 dols., Messrs. LORD & HEWLETT; (2) 600 dols., Mr. C. F. ROSBORG; (3) 400 dols., Mr. W. L. COTTRELL; (4) 300 dols., Messrs. ACKERMAN & ROSS; (5) 200 dols., Messrs. CARY & LYLE. The winners of the fifth prize belong to Buffalo, and all the others to New York City.

ENGLISH visitors are so much fascinated by the legend of ROMEO and JULIET when they visit Verona, they do not bestow sufficient attention on the most interesting churches and other remains of antiquity. There are parts of San Zeno which date from the ninth century, for the church is one of the few in Italy which escaped renovation by the masons from Como. The bronze doors are remarkable. The "wheel of Fortune," which was executed by BRISLOTTO in the eleventh century, although converted into a window, still is suggestive of its original condition. Embodied in the walls are fragments of ancient work. But neither age nor beauty can preserve San Zeno from defacement by the youth of Verona. A recent visitor says that the beautiful façade is being perforated as if it had sustained an attack by cannon-balls. The holes are due to youngsters who enjoy the odour which is emitted when the marble is struck by hard stone. One of the sacristans remonstrated with the juvenile vandals, and received in return a stab with a knife. As for the civic authorities, they seem to be afraid to interfere. Liberty of the same kind is exercised in other places besides Verona. The city has, unfortunately, a provision for attacks on marble. In the environs a stone is found which is called bronzine, because under the hands of the masons it sounds like a piece of metal. It is extremely hard, and as San Zeno exemplifies, marble cannot resist blows from it.

IN the last number of *L'Art* M. SIMON GUY offers some comments on the Museum of Decorative Art, to which the Pavillon Marsan of the Louvre is now appropriated. When the Union Centrale des Arts Décoratifs proposed the establishment of a museum in Paris we suggested that its position should not be on the Quai d'Orsay or in the neighbourhood of the Champs-Élysées, but somewhere in the east of Paris, where the furniture-makers, the metalworkers, &c., could easily have access to the collections. The Union seemed to think more of its own social position than of aiding the manufacturers of Paris, and after a long course of diplomacy was able to secure a part of the Louvre. That, no doubt, is a victory for the Union, and we expect the Pavillon Marsan will contain the objects for many a year. M. GUY recognises the state of the case. It is too late to have the change to a site which should have been selected in the first instance. What he advocates is the organising of "musées roulante," resembling the loan collections of the Board of Education, and which are known throughout England and Scotland. The Pavillon Marsan would be the treasury from which the collections would be derived in order to be sent to parts of Paris or provincial cities where they would be most useful. The cultivation of provincial workmen is essential. The authorities are enamoured of centralisation, and it somehow is in unison with the French mind. As soon as a student shows a little proficiency in drawing or modelling, sacrifices are made by himself and his family to enable him to reach the capital, where it is anticipated his abilities can be developed. M. GUY says his suggestions relate to an ideal organisation; but they are ideal not through any inapplicability to business, but solely because circumstances combine to give Paris a monopolising power, which, on many occasions has been found dangerous to France.

PAINTERS' ARCHITECTURE: DOMENICHINO.

### THE FUTURE OF ARCHITECTURE.

THERE are two ways of treating the history of architecture. It can be considered either comprehensively or in detail. Thus we may have the buildings of Western Asia or of Eastern Asia in one group, or under the former treat of the buildings of Assyria, Babylon, Phoenicia, the Israelites, the Medes and Persians, Phrygia, Lycia, &c. Eastern architecture can be taken as Indian, with outlying works having more or less relation to the general style, such as those in Cabul, Ceylon, Nepal, Java and China. A similar course may be followed in other regions. We have an example of the method by FRANZ KUGLER, who, however, treated all varieties of art simply as "Denkmäler" or memorials. Comprehensive views have, however, their drawbacks. They resemble the maps of the hemispheres, or those of Europe, Asia, Africa and America, which have to form part of an atlas, but which are less often referred to than maps of particular countries. KUGLER'S descriptions of Indian buildings seem very vague if they are compared with those of FERGUSSON in his volume on Indian architecture. The latter, moreover, cannot be considered as doing justice to remains when contrasted with the descriptions which are met with in the volumes of the "Archæological Survey of India."

It was perceived that in architecture there are so many varieties of work, the qualities were not demonstrated by classifying the examples in a few groups. Norman, Early English, Decorated and Perpendicular were quickly discovered to be inadequate as designations, and it was necessary to introduce intermediate or transition periods. It was even proposed that as the differences of Gothic were sufficiently marked they should be distinguished by the names of the sovereigns who then reigned. It was also realised that place was as important as time. Both in France and England evidence of the existence of schools having local peculiarities was forthcoming. Indeed, of late years classification by schools has apparently in France superseded the divisions of Romanesque, Transition, Primordial Gothic, Secondary Gothic and Tertiary Gothic.

With Greek architecture the ancient divisions of Doric and Ionic are too general, for there are modifications of the orders which have their importance. The Greeks acted on tradition in architecture as in sculpture. But some liberty was allowed and it was gladly utilised. The laws which were accepted in Athens were not thought to be binding in the colonies. Roman architecture was less formal or faithful to precedent than the Greek. Temporary conditions were permitted to exercise their influence. But the Romans were subjected to a temptation which was not favourable to varieties of treatment. Their power was felt in many lands, and policy dictated that the forms which were familiar in the capital should be imitated in provincial towns. There was, in fact, an official style which demanded respect. Instead therefore of objecting to the monotony of the buildings throughout Europe when it was under Roman sway, we should be gratified at the amount of diversity which was tolerated. The adoption of the

basilican plan in the Early Christian churches might also be presumed to favour repetitions in architecture wherever the religion was observed. But Byzantine and other influences came into operation, and we find that in Gaul, to take one country, Roman models were discarded in favour of the vaulted buildings which are usually known as Romanesque.

As regards Gothic it seemed to be probable the uniformity would be again manifested in all quarters of Europe. The monks, who for a long period were the sole architects, constituted a body of men who by their position were citizens of the world rather than inhabitants of particular countries. But somehow variety gained the upper hand, and in consequence we have French, German, English, Italian and Spanish Gothic, each with recognised peculiarities.

From these examples it would not be unreasonable to conclude that, in spite of all obstacles, individuality is sure to continue to assert itself in architecture, and that in future times it may in consequence be expected that a much difference among buildings will be shown as was seen in the past. That, however, is not the impression which was made on the mind of M. PASCAL, the French architect by the designs which he had to examine in the International Exhibition of 1900. In the exhibition buildings which each country constructed for the display of its own products he saw an endeavour to indicate forms which would be typical and national in every case, but the designs contributed for modern work did not in style correspond with the temporary structures. He could not resist the inference that in 1900 there was a tendency to a cosmopolitan architecture, and that even in what is called L'Art Nouveau marvellous resemblance existed between the experiments made in Belgium, Austria, France and England.

It is needless to remark the phenomenon was gratifying to M. PASCAL. As a member of the Institut de France he is better acquainted with the extent of the study which every French architect must go through. Is not too much time misspent when the outcome of it is only the production of a building with all the characteristics of a period that is separated from us by no more than a century? The most important of all the buildings of the exhibition was a work of that class. France, therefore, initiated the architecture of the century with copying instead of endeavouring to invent. The same spirit was observable in the works of other countries. It was complimentary to Frenchmen to see so much which was inspired by them, and it suggested that, although the Roman Empire had vanished, there was still an Imperial power which dictated the character of the architecture in parts of the globe which were unknown to all the CÆSARS.

M. PASCAL ascribes the similarity to such causes as the spread of democracy, the facilities for travelling, the distribution of wealth, the freedom of exchange, and the large scale on which enterprises are carried out. It was once said that the Pyrenees no longer existed, and as far as it is concerned, the boundaries of States cannot be said to

have a material existence, for whatever is found pleasing in one country is soon imitated or copied elsewhere. It would perhaps be more concise to state that the system of trusts has found its way into the arts, and especially into building. Countless businesses are consolidated and come under the control of one or a few directors. Wholesale production has become a necessity. Nothing more fatal to variety can be discovered. Look, for instance, at the tall buildings which may be counted as an American invention. In appearance they are colossal examples of monotony. The differences between them in an architectural sense are insignificant. It is no wonder that efforts have been made to combine them as one property, and it would no doubt be more economical if a single set of plans were followed for the structures which are to be erected.

In England we notice the operation of the same spirit, though on a less developed scale. In London, as well as in provincial towns, we see innumerable ranges of offices without occupants, and yet there is a desire for the erection of immense buildings like those in America. English enterprise has not yet acquired the courage which is necessary for the undertaking, but we have examples enough of long stretches of buildings which are repetitions of one design. Building companies and speculative firms find that profit is promoted by the arrangement, and art is bound to succumb to the greed for gain. The advantages of machinery are most evident in the production of work which can be measured by the mile, and which in proportion to the quantity can be turned out at a cheaper rate.

M. PASCAL has hopes that under the new conditions art may obtain a larger field for its display. The similarity of products may have effects on men which we cannot anticipate. In the creation of dress, food, literature, arms and other things mechanical repetition has long been supreme. By the aid of machinery the kinship between men has been established. It may be a blessing when the buses in long leagues of streets are indistinguishable except by their numbers. But a new theory of art will have to be evolved to deal with the novel conditions.

It is always possible to realise the inevitableness of a law of reaction in all things which concern men. There are people who, for a time at least, experience some repose in sameness. It is even considered philosophic when one in disregard the variety which nature presents, and like Mr. JOHNSON, believe that all green fields are alike. Few are now found to agree with the Fleet Street sage, and his saying seems to have led to more appreciation of the diversity which nature presents in our island. A like experience may be anticipated in architecture. As HEINE wrote, men must be always either Greeks or barbarians, and it may be assumed that the former will not find enjoyment in monotony for long, and the spirit to which we owe architecture that is worthy of the name will not always be content with the adoption of packing-case models for the buildings in which they live and work.

### OLD ENGLISH FURNITURE.\*

IN examining old English manufactures, whether in a museum, exhibition, or private collection, we are compelled to recognise the substantial character of the work and the carefulness of the owners. In furniture especially, which usually consists of several parts, the existence of ancient examples depends on the quality of the materials and the skill with which the parts have been combined. If that skill would often be insufficient to resist the power of time and the tendency of all things to decay if it were not for the reverence which people have for what is venerable. The importance of the latter factor is sometimes remarkable. In houses which have been occupied by the same family during many generations it is easy to understand why old furniture should always be carefully preserved. There are associations connected with examples which are sufficient to impart interest to them in the eyes of successive members of the family. They are also, as it were, title-deeds which afford evidence of former and con-

tinuous respectability. The large sums which are given for a variety of old curios at the present time, in the hope that they may be accepted by visitors as survivals of the possessions of the owner's family, are enough to suggest the value which must belong to examples which are genuine heirlooms.

If, however, we judge pieces of furniture by their intrinsic merit as beautiful objects, they cannot be considered so praiseworthy as they appear when regarded simply as relics of the past. For a long time there were restrictions on the exercise of imagination by furniture-makers. Indeed, it would not be difficult to uphold the theory that the English craftsmen were deprived of imaginative powers. They contented themselves with the repetition or adaptation of very few models, and their ornament is as wanting in variety as if the manifold forms of nature dare not be followed without incurring a penalty. The fancy which was found in all classes of contemporary literature is rarely met with in any branch of craftsmen's work. This is the more remarkable when we know that foreign artists were welcome in England, and that native artists might reasonably be incited to equal, if not to surpass their productions.

The shortcomings of old work ought never to be passed over. In the case of furniture there is always the risk that age alone will be looked on as sufficient to condone defects in design. We should never forget that many of the English woodworkers were mechanical in their operations, and that, like workmen of the present day, they were not proud of their business, and performed it in whatever way brought least trouble to them. We must admit that the work was throughout executed by hand, and that the only machine employed was the turner's lathe.

In our time, when so much can be effected by the aid of machinery, it is no doubt allowable to prize what was done by the hand with the assistance of a few tools. But we need not, in order to do justice to unknown workmen, exalt their productions into things of beauty which it is the duty of the world to preserve. "For ingenuity and quaintness of design," says Mr. HURRELL in the preface to his book on old English furniture, "richness of moulding or profusion of ornament, the old oak furniture of England and the internal woodwork and plasterwork of our old English mansions of the seventeenth and eighteenth centuries are probably unsurpassed by the contemporaneous work of any other country, while the numerous smaller country houses still left to us are full of most interesting detail of a more simple kind, but possessing the same originality and quaintness of spirit." A comparison between English and foreign work would be a colossal task, and may therefore be set aside. Originality and quaintness of spirit may be granted, but the test of tests is the presence of beauty, and the critic must be exceedingly tolerant who will admit that it is a general characteristic of old oak English furniture. While, therefore, we can understand that a collection of examples of such furniture may be of much interest to the antiquary, we must hesitate in agreeing with Mr. HURRELL that it is adapted "for reference to the architect, designer and craftsman whose business it is to produce similar work in modern times." If designing means the continuous repetition of subjects, regardless of their quality or their applicability, then copies to follow can hardly be too numerous. But if designing means creation and the invention of novelty, aids and suggestions of another kind are desirable.

We willingly acknowledge the care which has been taken by Mr. HURRELL in preparing a series of plates which from the abundance of detail will enable any ordinary cabinet-maker to produce cabinets, wardrobes, dressers, drawers, chests, presses, tables, chairs, &c., which will correspond with the ancient examples delineated. That is a kind of work for which there is at present a continual demand. But in criticising the examples we think it preferable to look on them as curiosities, or as things which should express local and temporary peculiarities rather than as forms which must be gratifying for all time.

As often happens with English work, the weakness of the different pieces of furniture represented is most strongly expressed in the parts that are supposed to be decorative. Oak is by no means easy to carve, especially when the forms introduced have to be curved. There is some excuse therefore when the lines are portions of circles, for

\* Measured Drawings of Old Oak English Furniture; also some remains of architectural woodwork, plasterwork, metalwork, glazing, &c. By John Weymouth Hurrell. (London: B. T. Batsford.)

they could be struck out without much difficulty. But the designers were not satisfied with semicircles and segments. They often attempted curves which are only partially circular, and the more elaborate the ornament the less pleasing it becomes. In instances where the craftsmen were content with using right lines, with or without right angles, the pieces appear to be dignified if compared with their more ambitious companions. The strapwork is also fairly successful although it leads to an excess of repetition. The lathe-work does not present many extravagances, but what is required in our time is quaint ornament, and although that is the least happy part of the furniture reproduced it is likely to be most generally admired. A large number of examples are derived from Little Moreton Hall, Cheshire. A corbel employed under oak ceiling beams is curious for the treatment of an acanthus leaf on the face, the numerous repetitions not having the slightest variation. It is worth comparing all the ornamental work in the interior with the entrance-gates between the moathouse and the courtyard, which are expressive of strength and yet are pleasing from the excellent moulded work which is shown. The wall-panelling in the same mansion is also in good style, and the woodwork of the building, unlike the furniture, gives the impression of the control of an architect. The panelling from Plas Mawr, Conway, is suggestive of heraldry, but the figures are arranged in a way that would astonish a herald. A quaint ceiling is shown from a house in Leek, in which branches are presented in such a manner as to amaze all who believe in the connection between vegetation and curves. In it the branches are all straight lines and the main stem is in each panel surmounted by a ram's head. Chetham's College, Manchester, possesses a very elaborate perforated staircase which the joiners must have rejoiced in. But for style it will not bear comparison with one in Prince's Tavern, John Dalton Street. Some illustrations of metalwork and glazing are also included.

One hundred and ten plates constitute the volume, and they all appear to be faithful records of old work. There is no attempt to extenuate any of the defects of the details. It is strange that nothing can be seen which is to be taken as a local style. The English love of precedent was exhibited as markedly in the joiners' workshops as in assize courts. Evidently certain patterns were in circulation and were followed as exactly as if they embodied established canons of art. It would be better if many of those things could be treated as obsolete, but the world, or at least the English race, will not allow of that course, and we presume for many a year the strange plant forms, wreaths, spirals, crescents, &c., will be favoured. In fact, they have gained a new lease of life from Mr. HURRELL's plates. As a trade auxiliary the volume must be considered as profitable, for it is possible to produce many sorts of old English antique furniture by the aid of the drawings, and they will have that genuine character which the modern amateur is supposed to be able to recognise and to enjoy. Architects and designers will, however, prefer to use the plates as a basis for creations which, although suggestive of an ancient spirit, will avoid the display of any of the weakness which in those days was the result of an imperfect knowledge of ornamental forms.

### COUTURE AND DUTUIT.

FEW modern paintings excited more interest than *The Decadence of the Romans*, by Thomas Couture. He was a morose artist, who lived in seclusion and brooded over his failures. He was out of harmony with his time, and it was really Imperial Paris which he satirised under the figures of ancient Romans. It is remarkable, however, that several able artists found their way to his studio. The despotism of the painter had the effect of making them indignant against his practice and the principles on which it was based. It is also curious that M. Dutuit, who has bequeathed to the Municipal Council of Paris a most valuable collection of paintings, and who was always a wealthy amateur, did not disdain serving the painter as a rapin or pupil-servant. The incident is related by Couture in his "Méthode et Entretien d'Atelier." We give a translation of the passage:—

About 1842 I occupied a modest atelier in the Passage du Bois-de-Boulogne. The year before I exhibited a picture of a young Venetian after an orgy. It was noticed and purchased. Thereupon I abandoned competitions and sought the support of the public. From my début it was benevolent towards me.

One day someone knocked timidly at my door and on bidding him enter I saw a singular person. His clothes were badly made, his shoes were large and heavy, and his trousers being too short allowed his blue stockings to be visible; in fact, he seemed to be clad in blue, and under his arm he carried one of those big umbrellas seen in the country and which was also of blue stuff. He hesitated about entering the atelier, his face was pale and troubled, and he appeared to be a mixture of a sacristan and mendicant. He told me in a trembling voice that he would be happy to receive my instructions, and came to inquire whether I would take him for a disciple. I was ambitious, and in this case thought I would have more embarrassment than profit, so I brutally refused. He appeared very sorry for his intrusion and bent his head as if he were a culprit. I was moved by his extreme modesty and asked him would he care to be my rapin. That, he said, would be his greatest happiness, and I told him to make arrangements accordingly.

He came back with an easel of white wood, a small box, a couple of stools and a mattress. I instructed him about keeping the atelier in order. As a rule the services are only rendered by young boys, and are never sought from a man, but the visitor was so humble he could be requested to do everything. Never was the atelier so well kept, the palettes were always clean and shining. He carefully watched me, and if I dropped a pencil picked it up and presented it to me with an old-fashioned bow. When the day was over he attended me to my lodging, and on leaving renewed his salutation. After some days he told me that I had said nothing about the fee he was to pay, and asked if seventy-five francs a month would be accepted. I explained to him that the best men were only paid twenty-five francs, and as he rendered me such good service I did not need any fees. He replied that in those ateliers there were a crowd of students who might never have the advantage of working with the master. As he insisted, I told him to give me the seventy-five francs, if the payment caused him no inconvenience, and to say no more on the subject. But he contrived to make a little packet of the money at the end of each month which I was sure to find in seeking for something else. Sometimes he wanted me to spend the evening with him and I refused. But once I accepted the invitation. We went to a good restaurant and were well served. I became alarmed about the expense for his sake, but he said he knew the owner, who was grateful for some little services he had done to him. We often went to auction-rooms, and I found he was skilful in the judging of old works. Once he said that a work by Hobbema, which we had admired, was sold for 37,000 francs. I replied they were happy who were able to acquire such masterpieces. This appeared to give him pleasure.

He was not without intelligence and never neglected his service. It was impossible to tell his age—whether he was twenty-eight or sixty. He was bent like an old man, but was interested in him and pitied him. We remained eighteen months together. A new rapin had arrived, and the old one had become my friend. One day he came to me in son excitement and announced that he was compelled to leave the evening, and would perhaps be absent for a couple of months. The next day a woman, who was a model, entered and told me that my student was a millionaire, and that he had gone in pursuit of a debtor who owed him 1,500,000 francs. I was surprised, for I supposed from what he said that he possessed not more than from four to five thousand francs of income. As he did not return, I imagined he had lost everything.

Long afterwards in going to Havre I passed by Rouen, city of which my friend had often spoken. I inquired of him, but was informed the only one of the name was the richest man in the country. However, I went to the hotel indicated as his residence and asked to see the master. I saw an old gentleman who bore some resemblance to my friend. I asked him if he had a son who was occupied with painting. In replying he told me who I was and said my visit was providential, for his son had only arrived the day before from Italy. When my ex-pupil appeared there was little change in his appearance. He conducted me to his room, which, he said, no stranger was allowed to visit. I was amazed at the number of marvellous masterpieces, and among them were several which I had looked at with him in auction-rooms. I questioned him if he was rich. He answered yes, and that he had not informed me of his position in order that he might obtain sincere advice. Then he told me that if I wished to come to Italy and that we should travel like princes.

When he inquired about my affairs I told him that after toiling hard to obtain success in the Salon, the places assigned to my pictures were so bad that my efforts were lost. He asked if I had not influential acquaintances such as a dervish or a valet, and then he said we must change our rôles and that he would become my guide. The next day we travelled to Paris in a carriage. We traversed the dirty and narrow streets which then surrounded the Louvre, and went to a gallery where they were arranging the pictures for the Salon exhibition. He pointed out an assistant to me and bade me

tell the man that my picture was numbered 334, and he would oblige me if it found a good place. I was to give him ten francs. The process was repeated with other assistants, and finally by his direction I gave twenty francs to the chief of the men. All the assistants seemed to be acquainted with my friend. A week afterwards the Salon was opened, my pictures were admirably hung, and I gained my first public success. Then he said to me, "The farce is over, you are recognised by the public, and henceforth your pictures will have to occupy good positions. Take my advice, one never succeeds through great people; they are greedy and make their profit out of the simpletons who come to them. In preference seek the aid of humble people; by paying them you will be well served." We then parted, and I have not seen my old pupil since. Couture died several years before his friend.

The *Times* correspondent writes on Tuesday:—The Paris Municipal Council to-day, at a special sitting, unanimously authorised the Prefect of the Seine to accept the Dutuit bequest, and to set apart the Petit Palais for the housing of this collection. The Council also voted the thanks of the city of Paris to the collector's widow, and voted two resolutions—one opening a credit of 8,000 francs for the erection of two busts of the Dutuit brothers, and another to give the name of Dutuit to one of the Paris streets.

The moment is opportune to explain to English readers the importance of the extraordinary riches of this collection, which, in the words of M. Georges Cain, who had been asked by the Municipal Council to report upon it, is one of the most complete private collections which have ever been made. Not that it is likely to startle the uninitiated who will see it for the first time at the Petit Palais. But, unlike the Thiers collection, which, taken all in all, is still one of the eyesores of the Louvre, and is bound, alas! to remain so, the Dutuit collection is made up of rarities in every form of art—from ceramics to bookbinding, and from Renaissance gems and Chinese lacquer-work to masterpieces in painting. Nothing could be more eclectic and, on the whole, nothing surer than the taste displayed in the innumerable pieces of which this treasure is composed.

There are fifty Italian majolicas and Arabic plates, the equal, says M. Cain, of anything of the sort in the museums of the world; three of the finest specimens known of the exceedingly rare faïence of Piron, and Rhodes plates, Rouen ware, Sèvres and Dresden and Chinese porcelain, all of the finest quality. Among the glasswork there are some fine specimens of enamelled Venetian ware, lamps from Moorish mosques and Eastern vases. Among the enamels thirty at least are incomparable. The gems, Renaissance jewels, precious boxes, watches, Florentine and French medals, and the almost complete collections of Greek, Roman and French coins are, says M. Cain, remarkable.

The collection of paintings is not very large, some sixty canvases in all, but thirty of them, mostly Dutch, are masterpieces. There are, notably, a Rembrandt portrait of himself, two landscapes by Hobbema, five Teniers, a Ruysdael, Ostades, Cuyp, &c., while among the French painters represented are Claude Lorraine, Lancret, Boucher, Watteau, Diaz, Greuze and Fragonard. But more important even than the paintings are the engravings, the value of which is inestimable. No public collection in France, M. Cain says, is so richly varied. Thus there are two proofs of the Rembrandt "Hundred Gelder" print which, as is well known, is worth from 35,000 francs to 50,000 francs, and copies of which are of the utmost rarity. There are two also of the "Ecce Homo," two of the "Christ Healing the Sick," and three of the "Calvary." Albert Dürer, Mantegna, Callot, Silvestre and Nanteuil are all represented.

The collection of rare books M. Cain describes as "really incomparable." There are 800 volumes, among them some very fine illuminated manuscripts and missals and books of hours. The bindings are by the Groliers and the Masolis, and scores of the volumes bear the arms of French kings and queens.

One might go on to catalogue in detail the antiquities and *objets d'art*—Etruscan, Egyptian, Greek and Roman—notably the famous treasure of Annecy and the objects in ivory. Every department of this collection, save perhaps that of the furniture and tapestry, is of the very finest quality and of great rarity. When installed at the Petit Palais it will form a museum worthy of the building and the site.

An Excursion Meeting of the Northern Architectural Association will be held to-morrow, August 23, when the following buildings will be visited:—St Hilda's Church, Burbook Street chapel, All Saints, West Hartlepool; the Grand hotel, the residences of Sir C. Furness (Tunstall Court) and Mr. W. C. Gray.

## THE HOUSING PROBLEM.

A LECTURE was given in Cambridge on Monday by Mr. F. W. Lawrence on "The Housing Problem." It seemed to him that to make them feel the sensational character of the housing problem was quite beside the mark. It was more to the point that they should realise what overcrowding of the ordinary character meant. He then went on to speak of how it affected a clerk in London or the ordinary workman. But the housing problem was something above this—more than tightness of accommodation and high rent. It was a matter of poky houses, poky streets, great distances from fresh air. It was a problem of diet, ugliness, absence of fresh air and absence of healthy life. It was essentially a city problem. By means of diagrams the lecturer illustrated the growth of London during the past century, and described it as being like the successive growths of the onion. The growth of the suburbs had been phenomenal. No one who had lived in London for a long time could fail to recognise the tremendous fascination of the great city. But what they had to consider was whether it was necessary that the growth of the city should have in conjunction with it this terrible evil of overcrowding. He did not think it was. But the maxim they should bear in mind was that prevention was better than cure. It was one thing to talk about bad houses in London and insanitary areas, and it was another to prevent their growing where at present they were not. Every day the problem was changing. Twenty or thirty years ago it lay in Poplar and Bromley. Now it had gone to the extreme edge of Canning Town, Ilford, Willesden and the districts in the south of London. It was a problem that was to be solved at the outskirts of the city rather than in the heart of the evil itself. What they wanted to do in the suburbs was to create broad open thoroughfares. Another thing which he thought they might with advantage insist upon was the creation of open spaces. Fine broad avenues would be of commercial advantage, and it was the same with public parks in the long run. Some more or less definite scheme of broad thoroughfares should be adopted, and there should be a central authority having jurisdiction extending several miles beyond the streets already existing. The most essential thing was to try to save the suburbs which had not yet been overrun by the ugliness of some of our town life.

## AMERICAN PRACTICE.

THE long contest between Mr. Hutton, one of the architects who submitted plans to the Pennsylvania Capitol Commission in its second competition, and the Philadelphia Chapter A.I.A., has been brought to a termination, says the *Architects and Builders' Magazine*, by a peremptory mandamus from the Court of Common Pleas against the Philadelphia Chapter of the American Institute of Architects, commanding that organisation to restore Addison Hutton to membership and to allow him to enjoy the privileges which he formerly had in the chapter.

Mr. Hutton, it will be remembered, was expelled by the chapter for violating a resolution forbidding the submission of bids and plans by members of the chapter for the completion of the State Capitol Building at Harrisburg, Pa.

The case had considerable political significance, it having been stated that the chapter adopted the prohibitory resolution for bids on public work as a result of the favouritism shown to architects of the political party in power. The resolution was adopted on November 8, 1901, and in part read:—

"Resolved, that participation in the competition for the completion of the State Capitol at Harrisburg, under the programme submitted by architects, will be considered on their merits.

"Resolved, That the said programme issued by the Capitol Building Commission is calculated only to encourage favouritism and injustice; that it obligated the Commission in no way to select the best designs or architects, and that, therefore, we advise all architects in Pennsylvania not to enter the competition."

In his petition for a mandamus Mr. Hutton declared that the adoption of this resolution by the chapter was illegal because it exceeded the powers conferred on the organisation by its charter. The chapter made due return to the writ, and contended that the resolution was properly adopted, and that the defendants had a right to establish such a prohibitory order in view of the by-law, which was passed for that very purpose.

Mr. Hutton demurred to this return, contending that all the objects, powers and responsibilities of the Corporation were expressed in its charter, and in that alone. Therefore, he argued, the chapter had exceeded its authority when it passed the by-law looking to the adoption of the complained of resolution. The Court took this view of the case, sustained Mr. Hutton's demurrer, and granted a mandamus against the chapter.

PYRMONT BRIDGE, SYDNEY, SWING SPAN OPEN. PORTIONS OF OLD BRIDGE IN FRONT.

### AUSTRALIAN BRIDGE BUILDING.

IN Australia the art of bridge construction has made rapid progress during the last few years, and the Commonwealth can now boast several structures reflecting credit both on the enterprise of the various States and the skill of the State engineers, there being few works, if any, of this kind carried out by private enterprise. The latest instance has been afforded by the New South Wales metropolis, where the Pyrmont Bridge, Sydney, unites a couple of densely populated shores, separated by a broad arm of Port Jackson. We gave some account of the structure last week, and we now give two views.

For working the bridge swing, two 50 horse-power electric motors are employed, the power being obtained from a power-house forming portion of the Sydney electric tramway system, the motors being carried on a platform inside the drum on which the swing span is supported, and working through a train of out gears two vertical shafts, on the lower ends of which are cast steel pinions meshing with a cast steel rock secured to top of pivot piers. To take up the jar caused by the sudden stoppage of such a large moving mass, buffers, consisting of heavy coil springs, are fixed over each rest pier, being so adjusted that should the span when closing be travelling too quickly it will jump the catch in a similar manner to a swinging gate, thus avoiding damage and necessitating only the reversing of the controller to bring the span back to its correct position. The swing span is, however, so easily controlled by means of the mechanical hand-brake that these buffers have so far shown themselves not to be required.

The ends of the span when free of supports have a deflection of  $3\frac{1}{2}$  inches, but when closed, to prevent chattering due to heavy loads, the ends are raised  $1\frac{1}{4}$  inch by means of a 35 horse-power motor gearing on to a longitudinal shaft running the whole length of the span, and working two horizontal shafts carrying cams under each main girder. This

operation takes 15 seconds, an automatic electric device being provided for stopping the same in their correct position. Each of the four gates on the side spans is operated by a 5 horse-power electric motor, capable of opening or closing the gate in 15 seconds. Automatic gear for locking the gates is provided, and an automatic electric device stops the gate in its correct position, the operating of the gates being controlled by the man in the controlling-house at the centre of the swing span. Mechanical tell-tales are placed in the controlling-house, by which the operator can see on a dial the position of the end lifts, and the position of the ends of the span when opening and closing. To insure duplicate parts being always available in the colony, the motors and controllers are of the standard pattern adopted by the State Railway Commissioners for tramway purposes. The bridge and approaches are lighted with 19 arc lamps, whilst six red arc lamps are placed on the ends of the protecting platform to guide vessels through the swing opening at night, the whole installation being under the control of the man in the operating-house at centre of the swing span. The estimated cost is only 112,000*l*.

### THE "LAMP OF LOTHIAN."

A MEETING of the heritors of Haddington parish was held in Haddington for consideration of a request from the kirk-session to sanction the restoration or reinstating of the ruinous transepts and tower of the parish church, better known as the "Lamp of Lothian." A gentleman, who preferred at present to remain incognito, had made an offer of 7,500*l*. for the purpose provided the heritors were unanimous. A memorandum was submitted from the Board of Works agreeable to the proposal subject to certain conditions, among which it was stipulated that the future maintenance must be by the heritors. The Earl of Wemyss, a heritor, wrote opposing the scheme, in protest not only against the specific proposal, but against the

PYRMONT BRIDGE, SYDNEY. THE OLD BRIDGE WITH SWING SPAN OF THE NEW BRIDGE.

spirit of destructive restoration unfortunately at work at the present time, and which was now threatening to extinguish the "Lamp of Lothian." Lord Wemyss enclosed copy of a letter from Mr. Eustace Balfour, C.E. (brother of the Prime Minister), who has taken a great interest in the matter, saying that people did not realise what an act of vandalism the proposal would be. The Society for the Protection of Ancient Buildings intimated that they would do everything in their power to frustrate the proposal. A deputation from the kirk-session said that body was unanimous in favour of restoration. The question of plans, which were numerous, was not discussed. After some discussion a motion to appoint a committee to collect all information, and if necessary consult an independent practical man, was agreed to unanimously, and a committee of twelve was appointed. There has been a great deal of discussion regarding whether what is known as the present "Lamp of Lothian," or "Abbey Church," or "St. Mary's Church" was the original "Lucerna Laudoniæ." The weight of evidence is probably against the present church and in favour of one which stood a hundred yards or so further north. The nave of the present church was restored in 1812, and again about twelve years ago, when an organ was instituted and great improvements were carried out. This is the only portion where public worship is conducted, all to the east, where Mrs. Carlyle is buried, being in a somewhat ruinous condition.

#### THE PURPOSE OF SCULPTURE.

ON Saturday Mr. Alfred Gilbert, R.A., lectured at Cambridge on the subject of "Sculpture." He observed that the art of sculpture had many and varied sides, and the more he worked the more he tried to find out which was the right and proper road to perfection. Sculpture was not merely a doing, a making, or the mere expression of a man's idea. It was threefold in its purpose. It was mechanical, to begin

with; it was real, to go on with; and it should be—and must be, if it was to carry any message forward—ideal. The work of a sculptor was not merely the work of one who hewed and broke and tried to make. His efforts should be moulded by that something called love, veneration, faith—that love which impelled him to give up everything, to do everything in his power to educate and lead his fellow beings to that extraordinary refinement and delicate perception of the beautiful which alone could be understood by those who love. Pygmalion so loved the image his own brain had created that he longed that the great creation should speak. The sculptor's great object was that his creation should speak—without the aid of an exhibition catalogue. The work of the artist should be the work not only of his art, but of his heart. The function of sculpture was not merely the making of an object. The primary object was to make something beautiful, something that whoever saw it should be elevated by it, something that was not the mere imitation of an everyday person. The more he thought the more was he astonished that the practice and the teaching and the encouragement of the art was so little thought of. The equipment of the sculptor was not sufficiently given in our art schools. The sculptor should be as well equipped as the mathematician, the poet or the architect, by education. He wanted to connect the practice of sculpture with the practice of general education. Until they did that he was convinced that they would never hope to take rank as artists with the great men among the Greeks, whose excellence was the outcome not only of a pure mechanical training and skill, but the influence of great mental culture. The artist must read and think, and the more he thought the better artist he was likely to be. He had been twenty-five years in finding out that he knew nothing about the making of a statue. He was only just beginning to know how to approach the exposition of the art, which was to make everything he touched as beautiful as his own unbeautiful nature would allow him to do.

## NOTES AND COMMENTS.

It is satisfactory to find that an effort has been at last made to enforce the Factory and Workshops Act of 1901 in London, where the provisions have been almost entirely neglected. A week ago the London County Council summoned the Columbus Company, Ltd., for employing more than forty persons on premises in Fetter Lane without being provided with a certificate from the Council that there were such means of escape in case of fire as could reasonably be required. The defence was that the company were only yearly tenants and would vacate the premises at the end of the year. The freeholders would, no doubt, put the premises into proper condition, which would necessitate an outlay of 500*l.* or 600*l.* It was suggested by the Council's representative that meanwhile a fire might break out. The Alderman adopted that view and a fine of 10*l.* was imposed with 5*l.* 5*s.* costs. The decision deserves general approval, and it may have the result of compelling people to accept their responsibilities by providing means to prevent the repetition of such catastrophes as that in Queen Victoria Street.

THE explorations undertaken by the French in Tunis have brought to light several examples of Roman remains. Some of the work is of higher quality than what is seen in many parts of Europe. One of the latest discoveries is a Temple of Mercury at Baugrara, which was an instance of polychrome decoration showing more refinement than is usually credited to Roman builders. In the vicinity of the temple the ruins of a large villa have also been unearthed, in which colourwork was employed not only in mosaics but in frescoes. The soil of Tunis is favourable to the preservation of stonework. It is possible to realise the appearance of Baugrara from the position of the temples and other public buildings. There is no doubt the discoveries will increase French prestige, and they give satisfaction to all the officials who have had the privilege of taking part in the operations.

THE report of Dr. COLLINGRIDGE, the medical officer of health for the City of London, contains interesting statistics. It appears that according to last year's returns, during the day the density of population was 519.6 persons to an acre, but at night it fell to 40.8 persons. It should, however, be noted that in preparing the last census no enumeration was made of the day population in the City. It was, however, found that 1,186,000 persons entered and left the City on one day in May. The assessed rateable value of property, "including temples," was 4,864,543*l.* in 1901, or nearly an eighth of the whole administrative county of London. The mortality in 1901 was 16.6 per 1,000; in the Metropolis it was 17.1, and in thirty-three great towns in England and Wales the average was 18.6. In City institutions such as workhouses, infirmaries and asylums the deaths were 25.2 per cent. of the whole City mortality. This is caused by overcrowding, for 1 in every 25 citizens is an inmate of either a workhouse, workhouse infirmary or a lunatic asylum, in comparison with 1 in every 101 inhabitants of the Metropolis. It is found that of the City deaths 7.45 per cent. were caused by injuries or violence. The large proportion of deaths from violence within the City as compared with the rest of London, though striking, is easily accounted for by the enormous concentration of vehicular traffic in crowded streets and the greatly increased danger resulting therefrom. It is probably only due to the excellent management of the traffic by the City police that this mortality is not much larger. In the artisans' dwellings belonging to the Corporation the death rate is below the average. It has been ascertained that the sanitary fittings are now obsolete, and it has been decided to remove all the existing water-closets and to replace them by others of a modern pattern. This is an example which should be imitated by other owners of dwellings, for although the buildings only date from 1885 many sanitary improvements have been since introduced. It is also proposed to supply a certain number of baths in each building. Over fifty tenement houses were closed or demolished during 1901. In Beech Street and Fann Street

the owners of some insanitary dwellings preferred to pull down the houses rather than comply with the sanitary committee's requirements, which would have involved more expenditure than the property was worth. In flushing streets and alleys of the poorer parts of the City no less than 39,708,690 gallons of water were employed, besides many thousand gallons of disinfectants. In the neighbourhood of Billingsgate deodorants have to be used at least twice in twenty-four hours.

FROM time to time there is a resurrection from obscurity of veteran French artists, and in fact it has grown difficult to determine who is the Nestor among them. The latest revival is M. CHARLES FAMIN. He won the Prix de Rome for architecture as far back as 1835; that is to say, fifteen years prior to M. BOUGEREAU, twenty-three years before M. HENNER, who are both considered as veteran painters, and eleven years before M. NORMAND, the architect. M. INGRES was then director of the school, and among M. FAMIN's contemporaries were PILS, GOUNOD, the composer, BOULANGER, and FAROCHON, the sculptor. M. FAMIN was born in 1809. His father was the architect who had charge of the Château Rambouillet. When a child he encountered NAPOLEON I. in a conservatory, and was embraced by the Emperor. M. FAMIN now lives at Chartres, and his memory still enables him to relate many interesting stories of his early days.

AS the late JAMES TISSOT, who died at his country house, the Abbey of Buillon, on the 9th inst., was born in 1836, it was to be expected that his work was not entirely completed, for he was still competent to present another phase of art. He was a painter of extraordinary versatility. He studied under FLANDRIN and LEMOTHE. The former revived religious painting, for the examples by him in the church of St. Germain de Près and St. Vincent de Paul are unlike the efforts of other painters. TISSOT could hardly escape from the influence of the master, but several years had to elapse before he attempted Scriptural subjects. At first he was thought to aim at becoming the favourite painter of Boulevardiers. Then he came to London and painted English subjects, and it was sometimes difficult to determine whether they were not meant for the amusement of Parisians. In his fiftieth year a change came over him. RENAN had given a new interpretation of the life of CHRIST, which was derived from his observations in the Holy Land. The book was not approved by all Christians, and efforts were made to counteract its influence. TISSOT realised that what RENAN had done with his pen could also be attempted by an artist with his pencil. Both the mystics and the great Renaissance artists had, he said, alike abandoned historical and topographical accuracy, and he therefore resolved to depict with fidelity the local characteristics which must have corresponded with those seen when CHRIST lived. A similar attempt had been made by some English pre-Raphaelite painters for occasional illustrations of New Testament history. But M. TISSOT avoided elaborate oil-paintings, and confined himself to the production of three or four hundred water-colour drawings. They were illustrations of M. RENAN's book rather than of New Testament history as popularly interpreted. The artist reckoned the series to be worth 60,000*l.*, but he accepted 40,000*l.* for them, and they were reproduced. The drawings have their use, but as works of art they fail because they do not express the colours which pervade all things in Palestine.

# TECHNICAL EDUCATION IN GERMANY.

THE following information concerning the provision for technical education in Germany was given before the Royal Commission on University Education in Ireland by Colonel G. T. Plunkett, C.B., director of the Science and Art Institution, Dublin:—

Mr. Justice Madden: You have given special attention to the provisions made on the Continent for technical instruction?—I went this year on the Continent, not for the first time, to look, in addition to other things, into the progress which had been made, especially in Germany, within very recent times, in the great technical colleges—in the extension of those colleges and of their work.

You have a general acquaintance with the German system of technical teaching?—Yes, I have, especially with the technical colleges and the higher class of technical teaching.

The colleges—polytechnic institutions or colleges—are quite independent of the universities, are they not?—They are absolutely independent and separate in Germany.

In fact they might be termed "Technical Universities"?—They are institutions complete in themselves?—They are institutions complete in themselves, yes.

And they give technical instruction of the highest kind?—Of the very highest kind—what is not usually spoken of here as technical instruction. Of course, it is a very comprehensive term. "Technical instruction" might include the education of a doctor or a lawyer. But the instruction given in these colleges is the instruction, generally speaking, of what are known as engineers—mechanical, electrical, mining, civil—and of chemists for all kinds of practical work, manufacturing chemists and constructors of chemical works, and leaders of great industries of that sort; to educate them.

We all know that there are two classes of schools in Germany—the *Gymnasien*, which correspond to our grammar schools, and the *Realschulen*, which might be described as modern schools?—Yes, there are.

The students from these schools pass, as a rule, either to the polytechnics or to the universities?—A very large number do; that is the object.

That is the idea—that they should go forward from what we call secondary schools, according to their ideas of life, or their destinations in life, either to the universities or to the polytechnic schools?—Yes, that is the case exactly.

Side by side with these polytechnic schools there are schools which give technical education of a more practical character, which might be described as a sort of apprenticeship?—Yes. In Germany there are what they call "handicraft schools," for educating superior artificers, foremen, designers and so on. Youths who enter the technical colleges are from the same classes as those who enter the universities, and would very seldom have been educated in public elementary schools; or clever boys from those there are the handicraft schools for training superior artisans.

I mention that because our attention has been called to the necessity of carefully distinguishing between the kind of technical education which corresponds to the teaching of an apprentice by his master and the higher technical education with which alone we are concerned. That distinction is clearly maintained in Germany in the way I have indicated?—It is clearly recognised in Germany—absolutely.

Is there any training in the polytechnic schools other than the higher technical education; I mean, is there any arts course, or a course of instruction in pure science?—Undoubtedly, some students take up chemistry or physics, for instance, in one of these institutions. They are not now called polytechnics, but *Technische Hochschulen*. Some students undoubtedly do take these sciences up, and from taste or some other reason do not go so far, perhaps, in the applied science, and become professors or teachers of pure science. But that is not the object of the institutions; it is simply that you cannot prevent a man, when he has been educated, going to what line he likes. The object of the institutions is as you have put it—to turn out what we call, roughly speaking, leaders of industry.

And to train mining and electrical engineers?—Electrical engineers—men who are fit to design and to carry out great electrical works, for carrying power, or for lighting towns and so on—not merely men who go round with a gang and carry out the work.

Is there any work in the direction of research done in these polytechnics?—There is a great deal. At Charlottenburg especially, there is a great deal of research done.

Discoveries in chemistry have resulted in the establishment of new industries; is that not so?—Most certainly. And not only that, but I was thinking while you were speaking of the advances which have been made in mechanical inventions, of the improvement of engines. Engines of different kinds are sent by inventors to be tried in such places as the Physical Institute, which is alongside and practically part of the Charlottenburg *Technische Hochschule*, and advances in mechanical science and electrical science are made by the researches

carried on in these laboratories, as well as in chemistry in the chemical laboratories.

Are the students trained in research, or is the work of research done by the professors?—The students are certainly trained. I did not see all of the institutions, but there is a great deal of training given to students in these great colleges in the methods of research.

At what age, generally speaking, do students enter these schools?—Those who are going to be mechanical and electrical engineers are, generally speaking, looking to employment on the State railways, which are the railways of Germany, or some other such great branch of the Government Technical Service, and these are obliged to spend a year of practical training in a workshop before they can enter on their course; therefore they are generally nineteen or nearly so before they enter. That year in a workshop is generally made into two years, because I found on actual inquiry from firms who make machine tools, ironworks and so on, that they will not take one of these young men for less than two years. They say that one year is useless. Therefore these youths who left school at about seventeen years of age or a little over are nineteen before they go into these colleges. But a considerable number of others who are not going into these mechanical lines enter the colleges at eighteen and seventeen years of age.

How many years does the course of study cover?—Three years is the minimum for what we should call an associate course. A great many take four years. An engineer very often indeed takes a three years' course, takes out his diploma then as a mechanical engineer, and then takes another year in order that he may have two diplomas—one mechanical and one electrical—a great part of the courses being identical for both.

There are apparently diplomas in different branches?—Yes.

Can you tell us what diplomas are given?—They can also give the degree of "doctor of science"; it is only within the last two years that that privilege has been given to these colleges.

Is it given to all of these colleges?—To all of the *Technische Hochschulen*; they are all under the one central authority for education.

That is a matter merely of detail; do not interrupt your evidence.—The information would be in many of the books and returns; I could send it.

The education there eventuates in a diploma, and you say that recently, within the last two years, these institutions have been enabled to confer the degree of doctor of science?—Yes, of doctor of science.

That degree they confer quite independently of the university?—Quite.

Most Rev. Dr. Healy: Do they confer the degree of bachelor of science?—I do not know; I believe there is no such degree in Germany.

Mr. Justice Madden: At all events, you know that they confer a recognised degree in science, that of doctor of science?—I know that.

You mentioned that these German technical colleges are under a central government?—Entirely.

Can you tell us whether it is a department of the State?—Yes; the Department of Education of each State in Germany.

The Department of Education in Germany is charged with primary and ordinary secondary education, as well as with this technical education?—I believe that it is charged with the primary and the secondary or intermediate and the university education of the country, as well as with these technical colleges. But I only believe that; I am not certain.

It is charged with education generally?—Yes, so I believe; with all the education of the country, except that given in the handicraft schools, which are under the municipalities.

I know that you have visited a number of these institutions, and I will ask you some questions about them individually. But I should like to know whether these separate colleges—take Darmstadt, Hanover, Aix-la-Chapelle, Charlottenburg—are self-governing institutions; are they what might be called autonomous colleges, or are they governed from a central authority? I mean in the matter of prescribing courses and in the internal regulation of the colleges?—I did not inquire particularly into that, but so far as I gather from talking with rectors of one or two, and with several professors, I think the course is very much the same in all, and that, speaking generally, though little details might be left to the councils of the colleges, all the general lines are laid down by the Department of Education.

Passing for a moment to the universities, they teach science?—They teach science. But the only university I went to this year was the University of Berlin, to see their new chemical laboratory, which is rather a famous building—I mean, it is a very fine one—and I gathered that, with a few exceptions, the chemistry taught there is entirely for those who are going to take to medical or pharmaceutical work; it is a preparation for that.

In fact, it is a preparation for one of the old professions?—

For one of the old professions, though I found there was an exception myself; there was an American student there who had been working in this country as well as in America, and he was there doing in vacation some research work with a German.

I should conclude that students who intend to become mechanical or electrical engineers, or scientific chemists, do not resort to the old universities?—No, certainly not; as a rule, they undoubtedly go to these new technical colleges.

How are ordinary civil engineers educated in Germany—do they receive a university degree or diploma, or do they receive their education at the technical schools?—They receive their education from these technical colleges.

Therefore they have not the advantage of an arts course in a university?—They have not; but it should be remembered that, according to the German school system, they have had a very excellent education up to the age of seventeen years, at least, before they go into the college.

Before they leave the *Gymnasias* probably?—Or the *Ober Realschulen*.

Is there anything in the nature of a leaving certificate given by the *Gymnasias* or *Realschulen* which carries the student up to the technical college?—Oh, yes.

That, I suppose, is a guarantee of some instruction in arts—of a certain amount of liberal education?—It is a guarantee of a very fair liberal education.

Though not exactly of the university type, but of the type of the higher secondary school?—Yes.

Dr. Starkie: Is it not a fact that even in the case of the universities the leaving certificate would relieve a student from any further study in arts?—I have heard that, but I do not know it of my own knowledge.

Mr. Justice Madden: That is to say, a student who takes up a scientific course in a university can specialise at once?—I believe that is the case, though I did not actually inquire into it as a matter of fact myself.

You mention Berlin. You visited not only the university there, but the technical college?—The Charlottenburg institution is the great technical college of Berlin, though it is referred to as the Charlottenburg College, it being in that suburb.

That is one of the technical colleges?—Yes; it is the finest of those in Germany—the largest.

How many students has it?—It had about 4,800 last session, and the rector, with whom I had a long conversation, said that he confidently expected 5,000 this October, and there were some new buildings in connection with the electrical laboratories and mechanical laboratories just then in progress, which he said would enable him to cater well for 5,000.

Dr. Starkie: Are they all day students?—All day students; there is no evening work.

Mr. Justice Madden: No evening work?—Nothing after seven o'clock at all; nothing after six o'clock generally. I said to the rector that I presumed when they had sufficient buildings and plant to educate 5,000 students, they would have sufficient for the needs of the country for a good many years to come, but he said, "Not at all; I confidently look forward in a few years to having to add 50 per cent. to the whole of our accommodation."

When you say "the needs of the country," you mean that portion of the country, because there are several of these schools in Germany?—Quite so; it does not cater for the Rhine Provinces, Hesse and many other parts. They not only consider they will have to increase their present colleges, but, in addition to the number they have, they have one now in progress of building at Dantzig, and they have decided on commencing another at Breslau.

The necessary funds for the establishment of these great colleges are supplied by the State, are they not?—Partly, and partly by municipalities.

Partly by municipalities and partly by the State?—And partly by the fees of students.

The students' fees, of course, would be a source of income?—Yes.

They are established by funds contributed partly by the State and partly by municipalities?—Yes.

Probably you are not in a position to tell us in what proportions?—I do not know the amount in the case of Charlottenburg, but I did find out exactly in the case of Darmstadt, the proportions they paid towards the annual income. The State of Hesse contributes 5,000*l.*; the city of Darmstadt contributes 10,000*l.* (I am taking one mark as equivalent to 1*s.*), and then the students' fees come to 15,000*l.* per annum. So that their annual expenditure is about 30,000*l.*

Dr. Starkie: What are the students' fees per head?—I can tell you, roughly speaking. Students who take the courses which correspond to our Associate course in the Charlottenburg College pay from 15*l.* to 20*l.* per annum; in the Darmstadt College the fees appear to be lower. Fees are remitted in some cases of promising students who cannot afford to pay.

Mr. Justice Madden: With reference to Charlottenburg, I presume that the technical school is supplied with adequate

apparatus and laboratories?—It is very handsomely equipped indeed; it is equipped on a magnificent scale in all those respects.

Were the colleges equipped by the State, or by the State and the municipalities conjointly?—That I cannot say.

The equipment is of a kind specially adapted for technical teaching, whereas I presume the equipment of the Berlin University is specially adapted for the kind of teaching which you have adverted to—University teaching?—Undoubtedly, though a chemical laboratory will be to some extent very much the same, whatever the object of the teaching is to be.

But very special appliances are necessary now for the training of engineers—mechanical and electrical—over and above the chemical laboratory that you might expect to find in an ordinary university; is not that so?—Very much so, as exemplified in the case of Charlottenburg Institute.

It would be very interesting if you were to give us an account of the nature of the equipment which you found there, because, I suppose, that could be taken as a thoroughly well-equipped technical school?—It is the finest. In the engineering machine-room, which was 164 feet long and 33 feet wide, all new types of engines are examined and tested. There is considerable competition amongst manufacturers of engines and machines to get their inventions sent in there for some weeks or months to be thoroughly tested and indicated by the professor and his assistants with his classes of students. So that not only do the students learn all about a new machine, but at the same time the inventor gets to know thoroughly, and brings before the public its capabilities. There are a professor and six assistants simply for the teaching in that one room. There is, among others, a new engine, called the sulphur-dioxide engine, which is being tried there, and which the professor himself or one of his assistants told me they thought might save 30 per cent.—increase, that is to say, the power derived from the fuel by 30 per cent., but it was still under experiment. In what is called the Engineering Institute there are a number of testing machines, in which manufacturers and contractors and others can have tested steel, iron, cement, stones, building materials of all kinds. There is one machine in it which is capable of testing up to 100 tons' resistance both to tension and compression, and also of registering a metal's elasticity. There is another one for testing up to 50 tons, a third for testing flexure up to 50 tons only, and another which will test any kind of strain—tension, compression, flexure—up to 100 tons. There is one for testing blocks of iron and stone for compression and tension up to 100 tons. I took these notes as an example of the liberal way in which these institutes are supplied with machines of all kinds. That is an institute which is considered insufficient. At present it is used by the public, by which I mean contractors and engineers, who send their materials to be tested. It is also used by professors of the college, who bring their students in to see the operations and to assist in carrying them out, and to learn. But they are going to build a new institute entirely, to which the larger machines will be removed, and no doubt some new ones added for the outside public, if I may say so, while this one will remain with the smaller machines only for the student classes. There is a laboratory attached to that part, quite in addition to the chemical branches of the college, for testing the resistance of materials to fire and to acids, that is to say, cement, building stones and bricks; there are diamond drills and saws for cutting sections of hard stones; there is a refrigerating machine for trying the strength of building stones and other such materials when they are reduced to very low temperature, to try the action of frost upon them. There is another room for the microscopic examination of oils, materials for making paper, and so on. This is all in one annexe, if I may call it so, in addition to the chemical and other laboratories of the college. The chemical department is a large annexe. As regards the students there, speaking generally, though there is a great deal of option as to the length of the course they will take, there are many ways in which they may take it, some taking more general science, some taking more special; but as a rule I found, as the result of a good deal of questioning, they take two years' general instruction in science in the college, then one year of pure chemistry, then one year, and very often two years, of some special branch of applied chemistry. To show the size of the annexe, I may say that there are over fifty lecture-rooms and laboratories in it. As an instance of the liberality with which they equip these colleges, perhaps I may mention that the exhibits which were collected in Germany for the Paris Exhibition in the chemical industry section, which are said to be worth 30,000*l.*, were brought back from Paris and the whole of them handed over to the Charlottenburg Institute. Seventeen professors and assistants in that college were sent to Paris to study the particular exhibits which bore on their teaching. In the department where electrical engineering or electro-technology is taught there is one very large laboratory divided into what they call eighteen stations, with a motor and dynamo to each, at which a group of four or five students is taught, so that the men get very individual and careful instruction. There

s a long gallery with three laboratories off it in which others are taught, so that altogether 300 students are working at electro-technology at one time. They had two accumulator batteries of sixty cells each. I thought it not worth while to inquire as to the exact number and power of the dynamos, as I could not keep the professor too long, but I found that it took one 25 h.-p. and one 100 h.-p. engine to work their electrical dynamos alone. There is an architectural faculty, as we should call it—an architectural division of the college. They have a large gallery and a large number of rooms, with an immense collection of architectural casts and drawings and diagrams, and I had a talk with the professor in charge of that department, as well as with those in charge of the engineering, and they seemed to think that it was very advantageous to an architect that he should learn the art of architecture there, and at the same time he could take courses in the practical part of building construction. With reference to what I said as to the students for the mechanical and the electrical engineering having first to take courses of one or two years—at least one year—in a workshop, the professors said that though the rule was obligatory only upon those who were going in for Government employment—which means a very great deal in Germany, as the railways are in the hands of the State—they would like to see that rule applied to all. They thought it should be, and they hoped it would be a rule made for all who were taking mechanical engineering.

Professor Lorrain Smith: You mean in the sense of getting the degree legalised?—They would like it to be a rule that no man could have a diploma given to him in mechanical or electrical engineering (which go together) unless he had spent at least one year at the bench in a workshop before going into the college. I gave a good deal of attention and inquiry to that point, because I know that their system and the American system are so very different, and the French is different again. I wanted to see what their views were, and that is what the professors said. I think those are the principal points which occur to me.

Mr. Justice Madden: As you are aware, we are inquiring into technical education in its widest sense, but in relation to university education?—Yes, I understand that.

So far the result of your evidence has been to place these side by side; but technical education is in Germany something outside the ordinary university system?—It is in Germany.

Has there been a movement in Germany leading towards any co-ordination or co-operation between the universities and the technical schools?—I heard nothing of that sort whatever. I think that they feel there is ample room for both, that what you alluded to as the older professions will keep the one full, and that the great demand there is for mechanical and electrical engineers and manufacturing chemists, and so on, will keep the others full.

In the universities is there any desire to undertake technical training, or is it considered advisable to leave it to the technical schools?—I am not able to answer that.

You are not aware of any movement of that sort?—I am not aware of any movement of that sort, but my inquiries were entirely among those connected with technical colleges or with manufacturers who made use of them themselves.

## RECENT DISCOVERIES IN CRETE.

THE special correspondent of the *Times*, in an important communication from Candia, writes:—

The principal discoveries of the past season up to the end of last April have been described by Mr. Evans in these columns. His anticipation that the remaining operations would be productive of interesting results has been amply fulfilled. On the northern side of the palace, near the north-east corner, a large portico has been revealed with double rows of six columns. The portico was evidently approached by a road leading up through the neighbouring valley from the sea coast; on the inner side a stepway communicates with the central court, the passage being flanked with bastions of huge square stones marked with tridents. This was evidently the sea gate through which the poetic imagination may picture the Minoan sailors passing with bands of captive pirates or, it may be, a disconsolate train of Athenian youths and maidens on their way to the lair of the Minotaur. One would gladly accept Mr. Evans's attractive idea—that in the intricate passages of the palace we find the original of the legendary Labyrinth, the haunt of the monster, and that the name is derived from the Carian "labrus," the double battle-axe, a sacred symbol which occurs so frequently in every part of the building. But his theory seems almost as applicable to the complicated structure at Phæstos, the other great palace now brought to light, where the double axe, which was also a symbol in the early Cretan script, repeatedly appears as a mason's mark, alternating with other signs. Notwithstanding the local legend, the fresco-paintings and reliefs of bulls at

Knossos can scarcely be taken as imparting a special character to the palace in view of the very frequent representations of the animal in Mycenaean art; nor is it easy to abandon the older view which connects "labyrinthos" with "laura," an a closed passage or alley—the name of more than one Greek monastery—and "Laureion," "the place of the the catacombs"—the mining town in Attica. A little below the north portico is a great sewer passing into the adjoining valley. In general the sanitary arrangements at Knossos seem to rival those of our own times. Shafts from the upper storeys communicate with conduits in the basement; the drain-pipes are almost exactly similar to those recently found by Professor Dörpfeld at Lerkas, and present a wonderfully modern appearance. On the south-eastern side of the palace another portico has been discovered with six columns and a corner pier. In the same quarter of the building—the residential portion of the palace—a number of ivory statuettes have been found in a kind of cupboard; here, too, on the last day of the excavations, I witnessed the clearance of a small chapel or shrine, where an altar-ledge with horns, a votive double axe of steatite, and various sacrificial objects were found.

The remarkable excavations carried out by the Italian archaeological mission at Phæstos under the able direction of Professor Halbherr form a counterpart to Mr. Evans's great undertaking at Knossos. The works, which were begun in June, 1900, occupied three seasons, and, like those at Knossos, have now been practically concluded. The site of the ancient Homeric city, the rival of Knossos, was identified by Admiral Spratt half a century ago, though no trace of the masonry was visible except a few calcined blocks on the summit of the acropolis. Phæstos lies almost due south of Mount Ida, at a distance of some three miles from the southern coast. The situation is one of extraordinary beauty; the acropolis, on which the fortress-palace of the Mycenaean "anaktes" stood, is the most easterly of a series of three eminences commanding a magnificent view over the wide plain of Messará, with its rich olive groves, cornfields and ruined Moslem villages; on the north are the snowy summits of Ida and the strange twin peaks of Kamáres; to the south-west is a charming glimpse of blue sea with the islet of Paximadi on the horizon. The architectural lines of the palace are incomparably more striking than those of Knossos. Here, also, there is a large western area, or agora; the pavement is traversed by some curious slightly-raised diagonal lines, which perhaps had reference to ceremonies or games celebrated in the enclosure. The agora terminates at its northern end in a broad series of stone steps, apparently intended for an auditorium. To the west, protected by a ramp—the Homeric "erkos"—another wide and imposing flight of steps leads up through a portico to the great hall, or "megaron," which measures 27·70 metres by 13·75, thus surpassing in dimensions any Mycenaean apartment yet discovered. The "megaron," like the "Hall of the Double Axes" at Knossos, is divided into two portions—a vestibule and an inner chamber consisting of two compartments separated from each other by three columns. To the right are the storerooms or magazines, ranged on either side of a broad corridor; in the centre a great stone pier, which apparently serves no structural purpose, may conceivably furnish another example of the Mycenaean pillar-cult. From the magazines we pass through another large "megaron" with columns, probably the hall of the men, as distinguished from the women's hall in the gynæconitis, into a vast rectangular space flanked with porticoes—the central court of the palace. In the whole range of Mycenaean discoveries there is nothing more imposing than this magnificent quadrangle; viewed from its southern end, with the snowy crest of Ida towering above, it possesses a strange and wonderful beauty in its present solitude and desolation. A broad doorway to the north, with niches on either side, apparently designed as sentry-boxes for two eunuchs, leads into the gynæconitis, the women's quarter, with thalami or bedrooms, a bath, a columned "megaron" and propylæa opening to the north. The buildings on the eastern side of the great court communicate with the gynæconitis, and are conjectured to have been the residential quarter; on the western side, separated from the magazines by a broad corridor, are a great number of small apartments, which were probably inhabited by servants.

Any adequate comparison of the two great palaces of Knossos and Phæstos would be excluded by present limits. The buildings present many points of similarity in general design, architectural features, mode of construction, and various details. Both sites were inhabited from the remotest times, as may be concluded from the neolithic deposits in the lowest strata. The abundance of "Kamáres" pottery at Phæstos shows that the place had attained considerable importance in pre-Mycenaean times. This type of ware occurs more sparingly at Knossos, where it appears in some of the lower levels. The palaces were both destroyed by fire in the Mycenaean age, but Phæstos, after a certain lapse of time, perhaps two centuries, was occupied by new settlers, of whom traces are found

in courses of post-Mycenæan masonry and in pottery of the "Kurtes" type, which is transitional from the late Mycenæan to the geometric. Thus we have an explanation of the comparative scarcity of Mycenæan domestic objects found at Phæstos. These were to a large extent used up, destroyed or removed by the subsequent inhabitants. Mycenæan Phæstos appears to have flourished somewhat earlier than Knossos and at a period anterior to the highest perfection of Mycenæan decorative art; the paintings, for example, are more primitive and conventional than those at Knossos, which abound in subjects taken from nature and real life. On the other hand, the structural magnificence of Phæstos—largely attributable, of course, to the greater capabilities of the site—the contemporaneous employment of the older cyclopean style with the use of squared blocks, the judicious selection of local and foreign materials, and the combination of solidity with elegance bear witness to the fullest development of Mycenæan architectural science. The excavations have confirmed the classical tradition with regard to the greater wealth and power of the Minoan city; the magazines at Knossos are more numerous and extensive—the curious cists let into their flooring for the concealment of treasure find no parallel at Phæstos—while the greater size and more elaborate painting of the vases and the representations of jewelled ewers and goblets and magnificent gold ornaments speak for themselves. There is little or nothing at Phæstos to show the existence of those Babylonian and Egyptian influences which are so marked at Knossos. Lastly, while evidence of the existence of Mycenæan writing is furnished by the inscribed stones and vases at Phæstos, no counterpart to the Knossian archives has been discovered here, with the exception of a single inscribed tablet with mixed linear and pictographic signs.

Professor Halbherr's brilliant discovery of another Mycenæan palace at Hagia Triáda (more correctly Hagia Trias), a few miles to the west of Phæstos, may be described as the sensational event of the past season. The palace stood on a picturesque hill top overlooking the alluvial plain, through which the Lethæus wanders on its way to the sea; at the nearer end of the plain is the tall smooth rock, "*lisse aipeia te eis hala petre*" (Odys. iii. 293), still confronting the waves of the Libyan sea; but it seems probable that in Mycenæan times a portion of the plain was submerged, the shore being in closer proximity to the palace, which Professor Halbherr conjectures to have been the maritime residence of the kings of Phæstos. The excavations, which were not begun till the closing days of the season, have yielded results which give promise of a rich series of discoveries during next year's campaign. In addition to the objects briefly described by telegraph three more tablets have been brought to light with pre-Hellenic inscriptions, two frescoes and a magnificent vase of black steatite. One of the frescoes displays a wood with plants and rocks, on which a bird, a cat, a hare and other animals disport themselves; the other gives an almost life-size representation of a Mycenæan lady arrayed in a sumptuous robe. The vase, a *chef-d'œuvre* of Mycenæan art, presents twenty-six figures in relief. A band of warriors, armed with tridents, marches along, preceded by shouting heralds and headed by a chief with long Homeric hair and heavy cuirass. The faces and figures supply well-marked and definite types, which will aid in the study of the pre-Hellenic Cretan race.

To the researches carried out by Miss Boyd at Gourniá and by Mr. R. C. Bosanquet at Palæocastro only a few words can be allotted, though both are deserving of a fuller description. At Gourniá, near the northern shore of the isthmus which connects the peninsula of Sitia with the rest of the island, a small but well-preserved Mycenæan settlement has been brought to light. Many interesting objects have been discovered: sacrificial vases, bronze saws and other implements, together with ante-Mycenæan fetishes and idols; what is more important, however, a sensible addition has been made to our knowledge of Mycenæan domestic architecture owing to the excellent preservation of some of the buildings. At Palæocastro, at the extreme east of the island, Mr. Bosanquet has obtained some notable results. Though the site has not been identified as that of any known Cretan city, the place appears to have been an important centre in Mycenæan and pre-Mycenæan times. Hitherto graves of the "Kamâres" epoch were practically unknown, but two cemeteries of this period have now been found here. They consist of small enclosures of masonry, divided by parallel walls into long, narrow compartments tightly packed with skulls and with heaps or bundles of bones. The bodies were apparently first buried elsewhere, and the bones, cleansed by interment, subsequently transported to their final resting-place. Thus a method of sepulture now commonly prevailing in the Levant would seem to have been in vogue before the Mycenæan age. In one of the cemeteries were found 140 vases, one apparently to each skull. Some Mycenæan tombs were also opened, in which the bones, as elsewhere, were found in "larnakes," or earthenware chests. Close by the sea, at a spot called Russolakkos, is a group of Mycenæan man-

sions, of which two have been cleared out. The larger of these presents a type intermediate between the ordinary Mycenæan dwelling and the great palaces of Knossos and Phæstos. It reproduces many features of the palaces, such as a columned "megaron" with adjoining bathroom, an upper storey approached by two staircases—one of them 7 feet wide—and magazines with vases of all sizes. Of all the objects brought to light here the most interesting is a tablet bearing seven lines of a linear script akin to that of the Knossian archives.

The excavations at Palæocastro will be continued next year should the requisite funds be forthcoming. For the work carried out by Mr. Bosanquet this season the modest sum of 150*l.* was all that was available. It must be remembered that while foreign Governments liberally support their several scientific missions in Crete and elsewhere, British archaeological enterprise is entirely dependent on voluntary contributions. For many years to come Crete will offer a field of extraordinary interest for exploration, and it is earnestly to be hoped that those who have already done so much to sustain the reputation of British scholarship and research will not be allowed to abandon their work for the want of the necessary means.

### THE BRITISH MUSEUM.

THE statement of progress in the British Museum for the year ending March 31, 1902, has appeared. The grand total number of visits to the Museum in the year 1901 was 718,614. This is an increase of more than 29,000 on the total of the year 1900, which was 689,249; and that total, again, was an increase of more than 25,000 on that of the previous year. The number of visits of students to the reading-room has risen to 200,035, as against 198,566 in 1900; a daily average of 664. In the several departments other than the reading-room there has been a further increase in the number of visits of students, the total last year being 57,943, as against 56,043 in 1900. The departments of prints and drawings and of coins and medals have been more frequented, but there has been a decline in the number of students drawing in the sculpture galleries.

Improved electric alarm circuits have been installed both within and without the building. The condition of the wooden floors in the public galleries has called for serious attention, the former system of scouring with water and cleansing fluids having caused the surfaces to decay very considerably. Several of the floors have now been refaced and are treated with polish, washing with water being thus superseded. This system will be extended to the wooden flooring throughout the building. Not only will the flooring itself be better preserved, but there will also be less accumulation of dirt and dust, with resulting benefit to the collections.

Important Egyptian antiquities from very early graves at Abydos have been presented to the Department of Egyptian and Assyrian Antiquities by the Egypt Exploration Fund, and the Department has also acquired by purchase numerous other antiquities of the same character. It has also secured a further considerable collection of tablets from Babylonia of a very early period, including documents in the Sumerian as well as in the old Babylonian language.

Among the acquisitions are a false door from the tomb of Ka-nefer, son of King Seneferu. The deceased was a priest who was attached to the service of the tomb of the king, his father; fourth dynasty, about B.C. 3766; a limestone door from the tomb of Qar, a high official who flourished in the fourth dynasty, about B.C. 3600; a limestone false door from the outside of the tomb; a small false door from the interior of the tomb; a false door in limestone from the tomb of Behenu, the wife of the official Qar; a large limestone stele made for Puherua, a scribe who flourished under King Sekhem-ka-Ra. This stele is the largest and most important of the known monuments of the thirteenth dynasty, the period to which it is probably to be assigned, about B.C. 2100.

The Assyrian antiquities have been enriched by a collection of 2,800 tablets from Lower Babylonia. They were inscribed during the period of the rule of the kings of the second dynasty of Ur, about B.C. 2500 to 2300, and of the kings of the first dynasty of Babylon about B.C. 2300 to 2050. They include a number of interesting commercial documents and contract tablets, which are written in the Sumerian and the Old Babylonian languages. There is also a clay cylinder of Nebuchadnezzar II, king of Babylon from B.C. 604 to 561; it is inscribed with an account of his building operations.

Among the additions to the Greek and Roman antiquities are a silver vase with chased design of lotus-leaves round the body. The character of the work is Græco-Egyptian, probably of the age of the Ptolemies. A bronze statuette of Athena Parthenos; a provincial copy of the statue by Phidias; the right hand is extended, the left hangs by the side; she wears helmet, peplos and ægis.

Mr. Henry Vaughan has bequeathed a fresco painting representing Bacchus standing to the front among vine branches; he wears a lion's skin and holds a wine-cup in his right hand. At his feet is a panther. The uppermost layer of the fresco consists of fine plaster, which has been polished into a very hard surface, like stone. On this surface the design has first been grounded in fine plaster; then upon this plaster ground the inner drawings and all details have been put on in colours mixed with a medium which would burn the colours into the plaster, as in ordinary fresco. This painting was exhibited in Paris in 1866, and was engraved in the "Gazette des Beaux-Arts" for that year. It then belonged to M. Delange, and was supposed to come from Pompeii. The exact provenance is unknown.

The acquisitions of British and Mediæval antiquities include a dug-out canoe, made from a tree trunk, found 6 feet deep on a former bank of the river Lea, during excavations for Lockwood Reservoir, Higham Hill, Walthamstow, given by Messrs. S. Pearson & Co., Ltd., and the East London Waterworks Company. A bronze lamp in the form of Silenus seated on a wineskin, resembling one already in the Museum from the Continent, found in Fenchurch Street, City of London, and was given by "the Friends of the British Museum." An important addition has been made to the continental series illustrating the late Celtic or early British period in these islands, by the purchase of the Gaulish collection of M. Léon Morel, hon. F.S.A., of Rheims and formerly of Châlons-sur-Marne. Hitherto the Museum has been unable to acquire more than a few isolated specimens of this period from abroad, but is now in possession of a fairly complete representation of the civilisation of north-east France from the palæolithic age to the Carolingian period. A large collection of stone implements, including some striking specimens from the drift and relics from neolithic graves and factory sites, illustrates the early phases of human life in north-west Europe, and by inference in Britain, both before and after our country became detached from the Continent. Of the bronze period there are swords with wide chapes of a type barely represented in the Museum; also a number of celts and bracelets, some of which are highly decorated. But the most valuable part of the collection comprises many rare and richly ornamented articles of bronze, ranging in date between 400 and 250 B.C. A red-figured kylix of the late Greek period and a large Etruscan oinochoë with gold decoration from a grave at Somme Bionne, Dept. Marne, where a warrior had been buried on his chariot, furnish a central date for this important series, which has already been published with an album of coloured plates, under the title of "La Champagne Souterraine" (Rheims, 1898). A large and representative collection of Gaulish pottery serves to illustrate the connection between the dwellers on the Marne and the Britons of the corresponding period, and at the same time to emphasise differences in detail between the population on either side of the Channel. The abundant and well-preserved pottery of the Gallo-Roman period forms another section of the Morel collection, and will be temporarily exhibited in this department. Besides a large number of minor objects, there is a fine series of glass, two heads from statues of Trajan and Diocletian, and a bas-relief found at the Roman triumphal arch still standing at Rheims. A leaden coffin of a child illustrates the funeral furniture characteristic of this time. The Merovingian period is also well represented by a complete series of sepulchral vases and a variety of brooches and other ornaments, including a rare and massive buckle of crystal, and a complete burial of a warrior has been preserved intact.

Another part of M. Morel's collection consists of 683 ancient Gaulish coins, comprising the issues of more than sixty different tribes and communities of Gallia Narbonensis, Lugdunensis, Belgica, &c., many of them uninscribed, and therefore classified under the localities in which they are repeatedly found, but some of them bearing inscriptions recording the names of various local chiefs and kings.

The department of coins and medals has obtained among many additions a silver stater weighing 185 grains, of the finest period of Greek art, the middle of the fourth century B.C. This coin is unique and one of the most beautiful examples of Peloponnesian work which exists on coins. The head of the goddess on the obverse is quite equal to that of Artemis on the contemporary stater of Stymphalus, and the form of the elaborate earring on the two coins is identical. On the reverse is Zeus seated on a throne, the arm of which is supported by a small sphinx. From his outstretched right arm he lets fly an eagle, and with his left he leans on a sceptre. In the field before him is a crested helmet, and behind the inscription ΑΧΑΙΩΝ, the letters of which seem to have been separately punched into the die. The type of Zeus letting fly an eagle is clearly an adaptation of the Zeus Lycaeus on the earlier coins of the Arcadians. There can be no doubt, therefore, that this beautiful coin belongs to the earlier Achæan federation, of which the famous Achæan league, formed in 280 B.C., was a revival. The historical value of this coin is very great, as it

proves that the Achæan communes, like the Arcadian after the battle of Leuctra (371 B.C.), combined to strike money in the name of the entire people.

The geological department has been presented with a series of mammalian remains from excavations for new Government buildings, Westminster, comprising human frontals, a human mandible, molar of *Elephas primigenius*, antler of *Rangifer tarandus*, part of skull of *Bos longifrons*, skull and mandible of *Equus caballus*, skull of *Capra hircus* and various other bones. Mr. W. F. Stanley has given a mandible of *Equus caballus* found in undisturbed gravel beneath 10 feet of soil at Great Turnstile, Holborn.

## ARCHÆOLOGY IN SUSSEX.

THE second day of the autumn meeting of the Sussex Archæological Society began with a perambulation of Hastings. Under the guidance of Mr. W. V. Crake, says the *Sussex Daily News*, the party walked to Hastings Castle, where Mr. Horace Sands read a paper descriptive of the old ruins. He pointed out the many features of interest, and his accounts were easily followed, as Mr. Dawson had thoughtfully a day or two before had a number of boards specially printed and hung explanatory of the various parts of the interior. The party then moved off to St. Clement's Church, where Canon H. C. B. Foyster very kindly explained the various interesting parts of this building.

Mr. H. Cousins then took the members in hand, and after pointing out several fine old buildings near, conducted the archæologists through the garden of the house of John Collier, who was five times mayor of Hastings in the time of George II. This view was arranged by kind permission of the Rev. W. C. Sayer-Milward. On reaching All Saints Church with its fine chancel arch, and its curious inscription under the tower, the Rev. G. A. Foyster acted as guide, all being delighted with the building. Passing out into All Saints Street, Mr. Cousins led again and pointed out all the curious and historic places of the East End, including the house of Ann Page, the "Queen" of Hastings and the house of the mother of Sir Cloudesley Shovel, the old Hastings Bank, Pelham House, the old Hastings Theatre (Wesley Chapel) and the sole remaining piece of the old Hastings wall. Waggonettes were requisitioned for a drive to Crowhurst, the route being *via* Bohemia, Springfield Road, Hollington Park, Wiltong Farm, over the Crowhurst railway to the church. Here Mr. H. M. Whitley, the hon. secretary, first drew attention to the palings or fence which surrounded the church, pointing out that in ancient times the farmers of the parish usually built it and kept it in repair. Each farmer had his own section (these were shown), and it was usual to find the initials or names of the man cut in the section, a custom not followed at this church.

Mr. E. T. Connold, in a very interesting paper on the Crowhurst yew tree, said the oldest tree was supposed to be the one at Fortingall, Perthshire, Scotland. The age of the Crowhurst yew was said to be 1,300 years. It measured 41 feet in circumference where the roots emerged from the ground; at 3 feet from the level of the ground it was 27 feet in circumference. Its height was about 45 feet. The trunk, which was very gnarled and full of knots, rose for about 8 feet and then divided into five smaller trunks. Two of these were hollow, a third partially so, and another quite dead and much broken. The upper portion of the fifth appeared to be dead, and was upheld by stout iron bands which passed around the trunk. Another was also prevented from falling by similar bands, and, were it not for their support, considerable portions would fall away. But in spite of all this the tree was in good health. Within the trunk was an irregularly-shaped cavity about 8 feet high, and large enough to contain one adult and three children. The stoutest limb branched off on the south side of the tree. It was 30 feet long, and supported by a massive prop. Another limb, which was 25 feet long, grew from the opposite side of the trunk. These measurements, together with the diameter of the trunk, showed that the boughs covered a space 64 feet in diameter. They would all probably notice how plentiful were the small bunches of contorted leaves at the termination of hundreds of the lesser twigs. These were the well-known yew-tree galls, and were caused by the larvæ of a fly named *Cecidomyia taxi*. Attention was called to the fact that while this tree was very much affected, the foliage of the other three yew trees was comparatively free from the insect.

A remarkable coincidence was then alluded to. In the county of Surrey there was a village named Crowhurst, and the church in that village was dedicated to St. George, as is also the church near which the party were standing. Furthermore, there was also in the churchyard at Crowhurst, Surrey, a venerable yew tree which was considered to be about 1,200 years old, and although rather larger at the base than the Sussex one, it was not so great in girth at 6 feet from the ground nor so high. The speaker dwelt at some length on the

reasons given for the yew being planted in churchyards, and mentioned several as follows:—(a) For its better protection; (b) because it was held sacred for the purpose of making bow staves for warriors (yew was not allowed to be exported, a foreign stave costing 6s. 8d., and English yew 2s.); (c) to protect the church from storms; (d) as a substitute for cypress. To the speaker's mind the most reasonable was the explanation of Collins, that "our forefathers were particularly careful in preserving this funereal tree, whose branches it was usual for mourners to carry in solemn procession to the grave, and afterwards to deposit them under the bodies of their departed friends."
